Colesevelam: May decrease the serum concentration of Ethinyl Estradiol. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Estrogen Derivatives may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Felbamate: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Felbamate: May decrease the serum concentration of Oral Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Fosaprepitant: May decrease the serum concentration of Oral Contraceptive (Estrogens). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Fosaprepitant: May decrease the serum concentration of Contraceptive (Progestins). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Griseofulvin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Griseofulvin: May increase the metabolism of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy*

modification

Herbs (Estrogenic Properties): May enhance the adverse/toxic effect of Estrogen Derivatives. *Risk C: Monitor therapy*

Herbs (Progestogenic Properties) (eg, Bloodroot, Yucca): May enhance the adverse/toxic effect of Progestins. *Risk C: Monitor therapy*

LamoTRIgine: Oral Contraceptive (Estrogens) may decrease the serum concentration of LamoTRIgine. *Risk D: Consider therapy modification*

Modafinil: May decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Mycophenolate: May decrease the serum concentration of Oral Contraceptive (Estrogens). Average AUC values were unchanged, but there was evidence of substantial patient-to-patient variability in response to this combination. *Risk D: Consider therapy modification*

Mycophenolate: May decrease the serum concentration of Oral Contraceptive (Progestins). *Risk D: Consider therapy modification*

Nafcillin: May increase the metabolism of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

OXcarbazepine: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

OXcarbazepine: May decrease the serum concentration of Oral Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Phenytoin: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Phenytoin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Protease Inhibitors: Oral Contraceptive (Estrogens) may diminish the therapeutic effect of Protease Inhibitors. Protease Inhibitors may decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Retinoic Acid Derivatives: May diminish the therapeutic effect of Oral Contraceptive (Progestins). Two forms of contraception are recommended in females of child-bearing potential during retinoic acid derivative therapy. **Exceptions:** Adapalene; Alitretinoin; Tretinoin (Topical). *Risk C: Monitor therapy*

Retinoic Acid Derivatives: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Two forms of contraception are recommended in females of child-bearing potential during retinoic acid derivative therapy. **Exceptions:** Adapalene; Alitretinoin; Tretinoin (Topical). *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May decrease the serum concentration of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Ropinirole: Estrogen Derivatives may increase the serum concentration of Ropinirole. *Risk C: Monitor therapy*

Rufinamide: May decrease the serum concentration of Ethinyl Estradiol. *Risk D: Consider therapy modification*

Selegiline: Oral Contraceptive (Estrogens) may increase the serum concentration of Selegiline. *Risk D: Consider therapy modification*

Selegiline: Oral Contraceptive (Progestins) may increase the serum concentration of Selegiline. *Risk D: Consider therapy modification*

St Johns Wort: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

St Johns Wort: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Thyroid Products: Estrogen Derivatives may diminish the therapeutic effect of Thyroid Products. *Risk C: Monitor therapy*

Tipranavir: Estrogen Derivatives may enhance the dermatologic adverse effect of Tipranavir. The combination of tipranavir/ritonavir and ethinyl estradiol/norethindrone was associated with a high incidence of skin rash. Tipranavir may decrease the serum concentration of Estrogen Derivatives. *Risk D: Consider therapy modification*

TiZANidine: Oral Contraceptive (Estrogens) may increase the serum concentration of TiZANidine. *Risk C: Monitor therapy*

Topiramate: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Oral Contraceptive (Estrogens) may diminish the anticoagulant effect of Vitamin K Antagonists. In contrast, enhanced anticoagulant effects have also been noted with some products. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Contraceptive (Progestins) may diminish the anticoagulant effect of Vitamin K Antagonists. In contrast, enhanced anticoagulant effects have also been noted with some products. *Risk D: Consider therapy modification*

Voriconazole: May decrease the metabolism of Oral Contraceptive (Estrogens). Oral Contraceptive (Estrogens) may increase the serum concentration of Voriconazole. *Risk C: Monitor therapy*

Voriconazole: May decrease the metabolism of Oral Contraceptive (Progestins). Oral Contraceptive (Progestins) may increase the serum concentration of Voriconazole. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: CNS effects of caffeine may be enhanced if combination hormonal contraceptives are used concurrently with caffeine. Grapefruit juice increases ethinyl estradiol concentrations and would be expected to increase progesterone serum levels as well; clinical implications are unclear.

Herb/Nutraceutical: St John's wort may decrease levels. Herbs with estrogenic properties may enhance the adverse/toxic effect of estrogen derivatives; examples include alfalfa, black cohosh, bloodroot, hops, kudzu, licorice, red clover, saw palmetto, soybean, thyme, wild yam, yucca. Herbs with progestogenic properties may enhance the adverse/toxic effect of progestins; examples include bloodroot, chasteberry, damiana, oregano, yucca.

Monitoring ParametersBefore starting therapy, a physical exam with reference to the breasts and pelvis are recommended, including a Papanicolaou smear. Exam may be deferred if appropriate; pregnancy should be ruled out prior to use. Monitor patient closely for loss of vision, sudden onset of proptosis, diplopia, migraine; blood pressure; signs and symptoms of thromboembolic disorders; signs or symptoms of depression; glycemic control in patients with diabetes; lipid profiles in patients being treated for hyperlipidemias. Adequate diagnostic measures, including endometrial sampling, if indicated, should be performed to rule out malignancy in all cases of undiagnosed abnormal vaginal bleeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, monophasic formulations:

Cryselle™: Ethinyl estradiol 0.03 mg and norgestrel 0.3 mg [21 white tablets and 7 light green inactive tablets] (28s)

Low-Ogestrel® 28: Ethinyl estradiol 0.03 mg and norgestrel 0.3 mg [21 white tablets and 7 peach inactive tablets] (28s)

Lo/Ovral® 28: Ethinyl estradiol 0.03 mg and norgestrel 0.3 mg [21 white tablets and 7 pink inactive tablets] (28s)

Ogestrel® 28: Ethinyl estradiol 0.05 mg and norgestrel 0.5 mg [21 white tablets and 7 peach inactive tablets] (28s)

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

0.3-30 mg-mcg (28): $26.99

Tablets (Lo/Ovral (28))

0.3-30 mg-mcg (28): $62.98

Tablets (Low-Ogestrel)

0.3-30 mg-mcg (28): $31.99

Tablets (Ogestrel)

0.5-50 mg-mcg (28): $41.99

Tablets (Ovral (28))

0.5-50 mg-mcg (28): $52.07

Mechanism of ActionCombination hormonal contraceptives inhibit ovulation via a negative feedback mechanism on the hypothalamus, which alters the normal pattern of gonadotropin secretion of a follicle-stimulating hormone (FSH) and luteinizing hormone by the anterior pituitary. The follicular phase FSH and midcycle surge of gonadotropins are inhibited. In addition, combination hormonal contraceptives produce alterations in the genital tract, including changes in the cervical mucus, rendering it unfavorable for sperm penetration even if ovulation occurs. Changes in the endometrium may also occur, producing an unfavorable environment for nidation. Combination hormonal contraceptive drugs may alter the tubal transport of the ova through the fallopian tubes. Progestational agents may also alter sperm fertility.

Pharmacotherapy PearlsThe World Health Organization (WHO) has issued revised management recommendations for missed combined oral contraceptive pills. Refer to the following reference for a complete presentation and discussion of the guidelines:

Faculty of Family Planning and Reproductive Health Care Clinical Effectiveness Unit, "Faculty Statement from the CEU on a New Publication: WHO Selected Practice Recommendations for Contraceptive Use Update. Missed pills: New Recommendations," *J Fam Plann Reprod Health Care*, 2005, 31(2):153-5.

Dental Health: Effects on Dental TreatmentWhen prescribing antibiotics, patient must be warned to use additional methods of birth control if on oral contraceptives.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, headache, depression, insomnia, nervousness, irritability, and mood disturbances

Mental Health: Effects on Psychiatric TreatmentBarbiturates decrease the effects of oral contraceptives; may increase the toxicity of the benzodiazepines and TCAs. The Women's Health Initiative (WHI) Memory Study reported an increased risk of developing dementia in postmenopausal women ≥65 years of age during 4 years of treatment with oral conjugated equine estrogens and medroxyprogesterone acetate relative to placebo (1.8% vs 0.9%). Relative risk was 2.05 (95% CI 1.21-3.48). Therefore, estrogens and progestins should not be used for the prevention of dementia. The WHI also reported an increased risk of stroke (29 vs 21 per 10,000 women-years) compared to women receiving placebo. The increase in risk was observed after the first year and persisted. May cause hypertriglyceridemia; monitor in patients receiving antipsychotics especially clozapine, olanzapine, and quetiapine.

Cardiovascular ConsiderationsIt is important to recognize that hormone-based contraceptives may induce or worsen hypertension. These problems are less severe with low-dose ones.Furthermore, hormone-based contraceptives may precipitate thromboembolic events, particularly in women who smoke. It is important that patients on these contraceptives long-term undergo monitoring of blood pressure and avoid cigarette use.

Index TermsMorning After Pill; Norgestrel and Ethinyl Estradiol

U.S. Brand NamesTrecator®

Canadian Brand NamesTrecator®

Pharmacologic CategoryAntitubercular Agent

Use: Labeled IndicationsTreatment of tuberculosis and other mycobacterial diseases, in conjunction with other antituberculosis agents, when first-line agents have failed or resistance has been demonstrated

Dosing: AdultsTuberculosis: Oral: 15-20 mg/kg/day; initiate dose at 250 mg/day for 1-2 days, then increase to 250 mg twice daily for 1-2 days, with gradual increases to highest tolerated dose; average adult dose: 750 mg/day (maximum: 1 g/day in 3-4 divided doses)

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricTuberculosis: Oral: 15-20 mg/kg/day in 2 divided doses, not to exceed 1 g/day

Dosing: Renal ImpairmentCl_{cr} <30 mL/minute: 250-500 mg/day

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralNeurotoxic effects may be relieved by the administration of pyridoxine (6-100 mg daily, lower doses are more common). May be taken with or without meals. Gastrointestinal adverse effects may be decreased by administration at bedtime, decreased dose, or giving antiemetics.

Dietary ConsiderationsHealthcare provider may recommend an increase in dietary intake of pyridoxine to prevent neurotoxic effects of ethionamide. Avoid alcohol.

ContraindicationsHypersensitivity to ethionamide or any component of the formulation; severe hepatic impairment

Warnings/Precautions

Disease-related concerns:

- Diabetes: Use with caution in patients with diabetes mellitus; may cause hypoglycemia.

- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction; hypothyroidism has been reported.

Concurrent drug therapy issues:

- Cycloserine: Use with caution in patients receiving cycloserine.

- Isoniazid: Use with caution in patients receiving isoniazid.

Dosage form specific issues:

- Product interchangeability: Use caution when switching patients from the sugar-coated tablet formulation (Trecator®-SC) to film-coated tablet (Trecator®); the dosage may need retitrated in order to avoid intolerance.

Other warnings/precautions:

- Eye exams: Periodic eye exams are recommended.

Geriatric ConsiderationsSince many elderly have Cl_{cr} <50 mL/minute, adjust dose for renal function.

Pregnancy Risk FactorC

Pregnancy ConsiderationsEthionamide crosses the placenta; teratogenic effects were observed in animal studies. Use during pregnancy is not recommended.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsIf ethionamide is used while breast-feeding, monitor the infant for adverse effects.

Adverse ReactionsFrequency not defined.

Cardiovascular: Postural hypotension

Central nervous system: Depression, dizziness, drowsiness, headache, psychiatric disturbances, restlessness, seizure

Dermatologic: Acne, alopecia, photosensitivity, purpura, rash

Endocrine & metabolic: Gynecomastia, hypoglycemia, hypothyroidism or goiter, pellagra-like syndrome

Gastrointestinal: Abdominal pain, anorexia, diarrhea, excessive salivation, metallic taste, nausea, stomatitis, vomiting, weight loss

Genitourinary: Impotence

Hematologic: Thrombocytopenia

Hepatic: Hepatitis, jaundice, liver function tests increased

Neuromuscular & skeletal: Peripheral neuritis, weakness (common)

Ocular: Blurred vision, diplopia, optic neuritis

Respiratory: Olfactory disturbances

Miscellaneous: Hypersensitivity reaction

Drug InteractionsThere are no known significant interactions.
Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid excessive ethanol ingestion; psychotic reaction may occur.

Monitoring ParametersInitial and periodic serum ALT and AST; ophthalmic exams; thyroid function
Nursing: Physical Assessment/MonitoringSee Contraindications, Warnings/Precautions, Drug Interactions, and Dosing for use cautions. Assess results of laboratory tests (see above), therapeutic effectiveness, and adverse response (eg, CNS changes, neuritis, and ocular changes - see Adverse Reactions) on a regular basis during therapy. Teach patient appropriate use (eg, need to adhere to dosing program), possible side effects/appropriate interventions, and adverse symptoms to report (see Patient Education). **Pregnancy risk factor C** - benefits of use should outweigh possible risks. Note breast-feeding caution.
Monitoring: Lab TestsInitial and periodic serum ALT and AST
Patient EducationTake this medication as prescribed; avoid missing doses and do not discontinue without contacting prescriber. Avoid excessive alcohol intake (may cause severe psychotic reaction). You will need to schedule regular medical checkups which will include blood tests. May cause GI upset (small, frequent meals may help); metallic taste and increased salivation (lozenges, frequent mouth care); dizziness, blurred vision (use caution when driving or engaging in tasks that require alertness until response to drug is known); postural hypotension (change position slowly); or impotence and/or menstrual difficulties (these will go away when drug is discontinued). Report acute unresolved GI upset, vision changes, numbness or pain in extremities, or unusual bleeding or bruising. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 250 mg

Generic AvailableNo
ManufacturerWyeth-Ayerst Laboratories
Pricing: U.S. (www.drugstore.com)

Tablets (Trecator-SC)

250 mg (60): $160.98

Mechanism of ActionInhibits peptide synthesis
Pharmacodynamics/Kinetics

Absorption: Rapid, complete

Distribution: Crosses placenta; V_d: 93.5 L

Protein binding: ~30%

Metabolism: Extensively hepatic to active and inactive metabolites

Bioavailability: 80%

Half-life elimination: 2-3 hours

Time to peak, serum: 1 hour

Excretion: Urine (<1% as unchanged drug; as active and inactive metabolites)

Special Alerts

Antiepileptics: Increased Risk of Suicidal Behavior or Ideation - Updated: December 2008

The U.S. Food and Drug Administration (FDA) has issued an update following the completion of its analysis concerning the risk of suicidality (suicidal behavior or ideation) observed during clinical trials of various antiepileptic drugs (compared to placebo) in the treatment of epilepsy, psychiatric disorders, and other conditions. The pooled analysis of 199 clinical trials involving 11 antiepileptic drugs (carbamazepine, divalproex sodium, felbamate, gabapentin, lamotrigine, levetiracetam, oxcarbazepine, pregabalin, tiagabine, topiramate, zonisamide) as either monotherapy or as adjuvant therapy showed that patients receiving an antiepileptic had a 0.43% risk of suicidal behavior/ideation compared to 0.24% of patients receiving placebo. As a result of the findings, the FDA will require that the product labeling of the entire class of antiepileptics include a warning concerning the risk of suicidality, and a medication guide be developed informing patients of this risk.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antiepileptic

Antiepileptics: Increased Risk of Suicidal Behavior or Ideation - February, 2008

The U.S. Food and Drug Administration (FDA) is informing healthcare professionals of an increased risk of suicidality (suicidal behavior or ideation) observed from analysis of clinical studies using various antiepileptic medications compared to placebo. The analysis was performed on 199 placebo-controlled studies involving 43,892 patients (27,863 treated patients versus 16,029 placebo patients) aged ≥5 years receiving one of the following 11 drugs: carbamazepine (Carbatrol®, Equetro™, Tegretol®, Tegretol® XR), felbamate (Felbatol®), gabapentin (Neurontin®), lamotrigine (Lamictal®), levetiracetam (Keppra®), oxcarbazepine (Trileptal®), pregabalin (Lyrica®), tiagabine (Gabitril®), topiramate (Topamax®), valproate (Depakote®, Depakote® ER, Depakene®, Depacon®), and zonisamide (Zonegran®). Studies examined medication efficacy in a variety of disorders, including epilepsy, psychiatric disorders (eg, depression, bipolar disorder), and other conditions (eg, migraine, neuropathic pain). According to the FDA, the results revealed a statistically significant increased risk of suicidality in 0.43% treated patients compared to 0.22% placebo patients, or an estimated 2.1 per 1000 (95% CI: 0.7, 4.2) more patients in the treated groups relative to placebo. This increased risk was reported anywhere from 1 week of therapy through 24 weeks. However, most trials were ≤24 weeks duration and the risk of suicide extending beyond 24 weeks is currently unknown. The relative risk of suicidal behavior or ideation in the treated patients was higher for patients with epilepsy (RR=3.6) compared to patients treated for psychiatric (RR=1.6) or other conditions (RR=2.3). Overall, the incidence of suicidal behavior or ideation occurred consistently across all demographic subgroups and with each of the drugs studied. Of note, four patients receiving an antiepileptic committed suicide relative to none in the placebo groups.

Forthcoming product labeling changes are likely to extend to all antiepileptic drugs and not limited to the drugs used in the studies, pending discussions scheduled for the upcoming advisory committee meeting. Healthcare professionals and family members/caregivers are encouraged to monitor patients receiving any antiepileptic medication for signs/symptoms of suicidality (eg, anxiety, depression, behavior changes). Patients should not stop taking their antiepileptic therapy unless advised by a healthcare professional.

Additional information can be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antiepileptic

Medication Safety Issues

Sound-alike/look-alike issues:

Ethosuximide may be confused with methsuximide

Zarontin® may be confused with Xalatan®, Zantac®, Zaroxolyn®

Pronunciation(eth oh SUKS i mide)
U.S. Brand NamesZarontin®
Canadian Brand NamesZarontin®
Pharmacologic CategoryAnticonvulsant, Succinimide
Use: Labeled IndicationsManagement of absence (petit mal) seizures
Dosing: Adults**Management of absence (petit mal) seizures:** Oral: Initial: 500 mg/day; increase by 250 mg as needed every 4-7 days up to 1.5 g/day in divided doses
Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Absence (petit mal) seizures: Oral:

Children 3-6 years: Initial: 250 mg/day; increase every 4-7 days; usual maintenance dose: 20 mg/kg/day; maximum dose: 1.5 g/day in divided doses.

Children >6 years: Refer to adult dosing.

Dosing: Renal ImpairmentUse with caution.
Dosing: Hepatic ImpairmentUse with caution.
Administration: OralAdminister with food or milk to avoid GI upset.
Dietary ConsiderationsIncrease dietary intake of folate; may be administered with food or milk.
ContraindicationsHypersensitivity to ethosuximide, other succinimides, or any component of the formulation
Allergy Considerations

- Succinimide Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Blood dyscrasias: Succinimides have been associated with severe blood dyscrasias.

- SLE: Succinimides have been associated with cases of systemic lupus erythematosus (SLE).

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Infection: Consider evaluation of blood counts in patients with signs/symptoms of infection.

- Renal impairment: Use with caution in patients with renal impairment.

Concurrent drug therapy issues:

- Sedatives: Effects with other sedative drugs or ethanol may be potentiated.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <3 years of age.

Other warnings/precautions:

- Appropriate use: Must be used in combination with other anticonvulsants in patients with both absence and tonic-clonic seizures. May increase tonic-clonic seizures in patients with mixed seizure disorders.

- Withdrawal: Anticonvulsants should not be discontinued abruptly because of the possibility of increasing seizure frequency; therapy should be withdrawn gradually to minimize the potential of increased seizure frequency, unless safety concerns require a more rapid withdrawal.

Geriatric ConsiderationsNo specific studies with the use of this medication in the elderly. Consider renal function and proceed slowly with dosing increases; monitor closely.
Pregnancy Considerations

Ethosuximide crosses the placenta. Cases of birth defects have been reported in infants. Epilepsy itself, the number of medications, genetic factors, or a combination of these probably influence the teratogenicity of anticonvulsant therapy. Health professionals and patients are encouraged to contact the North American Antiepileptic Drug Pregnancy registry to monitor outcomes of pregnant women exposed to ethosuximide and other antiepileptic drugs (888-233-2334).

LactationEnters breast milk/use caution (AAP rates “compatible”)
Adverse ReactionsFrequency not defined.

Central nervous system: Aggressiveness, ataxia, disturbance in sleep, dizziness, drowsiness, euphoria, fatigue, headache, hyperactivity, inability to concentrate, irritability, lethargy, mental depression (with cases of overt suicidal intentions), night terrors, paranoid psychosis

Dermatologic: Hirsutism, pruritus, rash, Stevens-Johnson syndrome, urticaria

Endocrine & metabolic: Libido increased

Gastrointestinal: Abdominal pain, anorexia, cramps, diarrhea, epigastric pain, gastric upset, gum hypertrophy, nausea, tongue swelling, vomiting, weight loss

Genitourinary: Hematuria (microscopic), vaginal bleeding

Hematologic: Agranulocytosis, eosinophilia, leukopenia, pancytopenia

Ocular: Myopia

Miscellaneous: Hiccups, systemic lupus erythematosus

Metabolism/Transport Effects**Substrate** of CYP3A4 (major)
Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the therapeutic effect of Ethosuximide. Amphetamines may decrease the serum concentration of Ethosuximide. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Ketorolac: May diminish the therapeutic effect of Anticonvulsants. *Risk C: Monitor therapy*

Mefloquine: May diminish the therapeutic effect of Anticonvulsants. Mefloquine may decrease the serum concentration of Anticonvulsants. Management: Mefloquine is contraindicated in persons with a history of convulsions. If anticonvulsant is being used for another indication monitor response to treatment closely, as concurrent mefloquine may decrease response to treatment. *Risk D: Consider therapy modification*

Valproic Acid: Ethosuximide may decrease the serum concentration of Valproic Acid. Valproic Acid may increase the serum concentration of Ethosuximide. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: St John's wort may decrease ethosuximide levels.

Monitoring ParametersSeizure frequency, trough serum concentrations; CBC, platelets, liver enzymes, urinalysis

Reference RangeTherapeutic: 40-100 mcg/mL

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor therapeutic effectiveness, laboratory values, and adverse reactions at beginning of therapy and periodically with long-term use. Observe and teach seizure/safety precautions. Taper dosage slowly when discontinuing. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsTrough serum concentrations, CBC, platelets, liver enzymes, urinalysis

Patient EducationTake exactly as directed; do not increase dose or frequency or discontinue without consulting prescriber. While using this medication, do not use alcohol and other prescription or OTC medications (especially pain medications, sedatives, antihistamines, or hypnotics) without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, loss of appetite, or dry mouth (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or constipation (increased exercise, fluids, fruit, or fiber may help). Wear identification of epileptic status and medications. Report CNS changes, mentation changes, or changes in cognition; muscle cramping, weakness, tremors, or changes in gait; persistent GI symptoms (cramping, constipation, vomiting, anorexia); rash or skin irritations; unusual bruising or bleeding (mouth, urine, stool); signs or symptoms of an infection (eg, sore throat, fever) or worsening of seizure activity or loss of seizure control. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber before breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 250 mg

Zarontin®: 250 mg

Syrup: 250 mg/5 mL (473 mL)

Zarontin®: 250 mg/5 mL [contains sodium benzoate; raspberry flavor]

Generic AvailableYes

ManufacturerPfizer Inc

Pricing: U.S. (www.drugstore.com)

Capsules (Ethosuximide)

250 mg (30): $42.99

Capsules (Zarontin)

250 mg (60): $85.04

Solution (Ethosuximide)

250 mg/5 mL (474): $57.97

Solution (Zarontin)

250 mg/5 mL (300): $93.45

Mechanism of ActionIncreases the seizure threshold and suppresses paroxysmal spike-and-wave pattern in absence seizures; depresses nerve transmission in the motor cortex

Pharmacodynamics/Kinetics

Distribution: Adults: V_d: 0.62-0.72 L/kg

Metabolism: Hepatic (~80% to 3 inactive metabolites)

Half-life elimination, serum: Children: 30 hours; Adults: 50-60 hours

Time to peak, serum: Capsule: ~2-4 hours; Syrup: <2-4 hours

Excretion: Urine, slowly (50% as metabolites, 10% to 20% as unchanged drug); feces (small amounts)

Related Information

- Anticonvulsants by Seizure Type
- Status Epilepticus

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status May cause sedation, euphoria, insomnia, or hallucinations; may rarely cause depression

Mental Health: Effects on Psychiatric Treatment Barbiturates and carbamazepine may decrease the clinical effects of ethosuximide

Antiepileptics: Increased Risk of Suicidal Behavior or Ideation - Updated: December 2008

The U.S. Food and Drug Administration (FDA) has issued an update following the completion of its analysis concerning the risk of suicidality (suicidal behavior or ideation) observed during clinical trials of various antiepileptic drugs (compared to placebo) in the treatment of epilepsy, psychiatric disorders, and other conditions. The pooled analysis of 199 clinical trials involving 11 antiepileptic drugs (carbamazepine, divalproex sodium, felbamate, gabapentin, lamotrigine, levetiracetam, oxcarbazepine, pregabalin, tiagabine, topiramate, zonisamide) as either monotherapy or as adjuvant therapy showed that patients receiving an antiepileptic had a 0.43% risk of suicidal behavior/ideation compared to 0.24% of patients receiving placebo. As a result of the findings, the FDA will require that the product labeling of the entire class of antiepileptics include a warning concerning the risk of suicidality, and a medication guide be developed informing patients of this risk.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antiepileptic

Antiepileptics: Increased Risk of Suicidal Behavior or Ideation - February, 2008

The U.S. Food and Drug Administration (FDA) is informing healthcare professionals of an increased risk of suicidality (suicidal behavior or ideation) observed from analysis of clinical studies using various antiepileptic medications compared to placebo. The analysis was performed on 199 placebo-controlled studies involving 43,892 patients (27,863 treated patients versus 16,029 placebo patients) aged ≥5 years receiving one of the following 11 drugs: carbamazepine (Carbatrol®, Equetro™, Tegretol®, Tegretol® XR), felbamate (Felbatol®), gabapentin (Neurontin®), lamotrigine (Lamictal®), levetiracetam (Keppra®), oxcarbazepine (Trileptal®), pregabalin (Lyrica®), tiagabine (Gabitril®), topiramate (Topamax®), valproate (Depakote®, Depakote® ER, Depakene®, Depacon®), and zonisamide (Zonegran®). Studies examined medication efficacy in a variety of disorders, including epilepsy, psychiatric disorders (eg, depression, bipolar disorder), and other conditions (eg, migraine, neuropathic pain). According to the FDA, the results revealed a statistically significant increased risk of suicidality in 0.43% treated patients compared to 0.22% placebo patients, or an estimated 2.1 per 1000 (95% CI: 0.7, 4.2) more patients in the treated groups relative to placebo. This increased risk was reported anywhere from 1 week of therapy through 24 weeks. However, most trials were ≤24 weeks duration and the risk of suicide extending beyond 24 weeks is currently unknown. The relative risk of suicidal behavior or ideation in the treated patients was higher for patients with epilepsy (RR=3.6) compared to patients treated for psychiatric (RR=1.6) or other conditions (RR=2.3). Overall, the incidence of suicidal behavior or ideation occurred consistently across all demographic subgroups and with each of the drugs studied. Of note, four patients receiving an antiepileptic committed suicide relative to none in the placebo groups.

Forthcoming product labeling changes are likely to extend to all antiepileptic drugs and not limited to the drugs used in the studies, pending discussions scheduled for the upcoming advisory committee meeting. Healthcare professionals and family members/caregivers are encouraged to monitor patients receiving any antiepileptic medication for signs/symptoms of suicidality (eg, anxiety, depression, behavior changes). Patients should not stop taking their antiepileptic therapy unless advised by a healthcare professional.

Additional information can be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antiepileptic

Pronunciation(ETH oh toyn)

U.S. Brand NamesPeganone®

Canadian Brand NamesPeganone®

Pharmacologic CategoryAnticonvulsant, Hydantoin

Use: Labeled IndicationsGeneralized tonic-clonic or complex-partial seizures

Dosing: AdultsGeneralized tonic-clonic or complex-partial seizures: Oral: Initial dose: ≤1 g/day; usual maintenance dose: 2-3 g/day

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricAnticonvulsant: Children ≥1 year: Oral: Maximum initial dose: 750 mg/day; usual maintenance dose: 0.5-1 g/day; maximum dose: 3 g/day

Administration: OralAdminister with food to decrease GI distress. Administer in 4-6 divided doses daily, spaced as evenly as practical.

Dietary ConsiderationsShould be taken after meals.

StorageStore below 25˚C (77˚F).

ContraindicationsHypersensitivity to ethotoin or any component of the formulation; hepatic abnormalities; hematologic disorders

Allergy Considerations

- Aromatic Anticonvulsant Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- Anemia: Hydantoin-like compounds may interfere with folic acid metabolism precipitating megaloblastic anemia.

- Hypersensitivity reactions: May occur with therapy.

Concurrent drug therapy issues:

- Sedatives: Effects with other sedative drugs or ethanol may be potentiated.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <1 year of age.

Other warnings/precautions:

- Withdrawal: Anticonvulsants should not be discontinued abruptly because of the possibility of increasing seizure frequency; therapy should be withdrawn gradually to minimize the potential of increased seizure frequency, unless safety concerns require a more rapid withdrawal.

Pregnancy Risk FactorD

Pregnancy ConsiderationsMaternal ingestion of antiepileptic agents has been associated with neonatal coagulation defects/bleeding usually within 24 hours of birth. Congenital malformations (including a pattern of malformations termed the “fetal hydantoin syndrome” or “fetal anticonvulsant syndrome”) have been reported with the use of other hydantoin derivatives, however, case reports using ethotoin during pregnancy are few. Epilepsy itself, the number of medications, genetic factors, or a combination of these probably influence the teratogenicity of anticonvulsant therapy.

A pregnancy registry is available for women exposed to antiepileptic drugs (including ethotoin) at the Genetics and Teratology Unit Massachusetts General Hospital, 1-888-233-2334.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsThe manufacturer recommends discontinuing breast-feeding during ethotoin therapy.

Adverse ReactionsFrequency not defined.

Cardiovascular: Chest pain

Central nervous system: Ataxia, dizziness, fatigue, fever, headache, insomnia

Dermatologic: Skin rash, Stevens-Johnson syndrome

Gastrointestinal: Diarrhea, gingival hyperplasia, nausea, vomiting

Hematologic: Blood dyscrasias

Neuromuscular & skeletal: Numbness

Ocular: Diplopia, nystagmus

Miscellaneous: Lymphadenopathy, SLE-like syndrome

Metabolism/Transport Effects**Inhibits** CYP2C19 (weak)

Drug Interactions

Acetaminophen: Anticonvulsants (Hydantoin) may increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Antacids: May decrease the serum concentration of Anticonvulsants (Hydantoin). *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May enhance the adverse/toxic effect of Anticonvulsants (Hydantoin). Specifically, osteomalacia and rickets. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

Chloramphenicol: May decrease the metabolism of Anticonvulsants (Hydantoin). Anticonvulsants (Hydantoin) may decrease the serum concentration of Chloramphenicol. Increased chloramphenicol concentrations have also been seen. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Ketorolac: May diminish the therapeutic effect of Anticonvulsants. *Risk C: Monitor therapy*

Mefloquine: May diminish the therapeutic effect of Anticonvulsants. Mefloquine may decrease the serum concentration of Anticonvulsants. Management: Mefloquine is contraindicated in persons with a history of convulsions. If anticonvulsant is being used for another indication monitor response to treatment closely, as concurrent mefloquine may decrease response to treatment. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).

Monitoring ParametersCBC, urinalysis

Monitoring: Lab TestsCBC, urinalysis

Bisphosphonates: Safety Update Regarding Possible Association With Atrial Fibrillation - November 2008

The Food and Drug Administration (FDA) has been reviewing placebo-controlled trials of the 7 bisphosphonates currently marketed in the US. This review is in response to study results associating an increased incidence of atrial fibrillation (AF) with alendronate or zoledronic acid use in women (65-89 years of age) with osteoporosis.

The FDA reviewed all the submitted data (19,687 bisphosphonate-treated patients and 18,358 placebo-treated patients) from these studies. Overall, the occurrence of AF was rare in each study with an absolute difference in event rates between each of the bisphosphonate and placebo arms of 0-3 per 1000. A zoledronic acid study showed a statistically significant increase in the rate of AF in the active treatment arm. However, no clear association between bisphosphonate use and AF could be established. In this study, AF events were diagnosed more than 30 days after receiving zoledronic acid in 47 of the 50 patients diagnosed with AF. According to the FDA, healthcare providers should not alter their prescribing patterns for bisphosphonates and patients should not stop taking their medication.

The FDA will continue monitoring the safety of bisphosphonates through postmarketing reports and is assessing the need for additional epidemiologic studies.

Further information is available at http://www.fda.gov/cder/drug/early_comm/bisphosphonates_update_200811.htm

Bisphosphonates: Possible Association with Severe Musculoskeletal Pain - January, 2008

The Food and Drug Administration (FDA) is informing healthcare practitioners of the possible association between bisphosphonate use and the development of severe (possibly incapacitating) bone, muscle, and/or joint pain. The severe musculoskeletal pain may develop days, months, or years after initiating a bisphosphonate. This is a distinct event from the acute phase response (eg, fever, chills, bone pain, myalgia, arthralgia) that may occur following initial bisphosphonate administration which generally resolves within several days of continued use.

Frequency of and contributing risk factors between severe musculoskeletal pain and bisphosphonate use are currently unknown.

Further information is available at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Bisphosphonates

Medication Safety Issues

Sound-alike/look-alike issues:

> Etidronate may be confused with etidocaine, etomidate, etretinate

Pronunciation(e ti DROE nate dye SOW dee um)

U.S. Brand NamesDidronel®

Canadian Brand NamesDidronel®; Gen-Etidronate

Pharmacologic Category[Bisphosphonate Derivative]()

Use: Labeled IndicationsSymptomatic treatment of Paget's disease; prevention and treatment of heterotopic ossification due to spinal cord injury or after total hip replacement

Use: Unlabeled/InvestigationalPostmenopausal osteoporosis

Dosing: Adults

Paget's disease: Oral:

> *Initial:* 5-10 mg/kg/day (not to exceed 6 months) or 11-20 mg/kg/day (not to exceed 3 months). Doses >20 mg/kg/day are **not** recommended.
>
> *Retreatment:* Initiate only after etidronate-free period ≥90 days. Monitor patients every 3-6 months. Retreatment regimens are the same as for initial treatment.

Heterotopic ossification: Oral:

> *Caused by spinal cord injury:* 20 mg/kg/day for 2 weeks, then 10 mg/kg/day for 10 weeks; total treatment period: 12 weeks
>
> *Complicating total hip replacement:* 20 mg/kg/day for 1 month preoperatively then 20 mg/kg/day for 3 months postoperatively; total treatment

period is 4 months

Postmenopausal osteoporosis (unlabeled use): Oral: 400 mg/day for 2 weeks, followed by 13-week period with no etidronate, then repeat cycle. Maintain adequate calcium and vitamin D intake during the entire 15-week treatment cycle

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentUse with caution; specific guidelines are not available, however consider dose reduction.
Administration: OralAdminister tablet on an empty stomach 2 hours before food.
Dietary ConsiderationsAdminister tablet with water or fruit juice on an empty stomach; avoid administering foods/supplements with calcium, iron, or magnesium within 2 hours of drug; maintain adequate intake of calcium and vitamin D.
StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F).
ContraindicationsHypersensitivity to bisphosphonates or any component of the formulation; overt osteomalacia
Allergy Considerations

- Bisphosphonate Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Bone/joint/muscle pain: Infrequently, severe (and occasionally debilitating) bone, joint, and/or muscle pain have been reported during bisphosphonate treatment. The onset of pain ranged from a single day to several months. Symptoms usually resolve upon discontinuation. Some patients experienced recurrence when rechallenged with same drug or another bisphosphonate; avoid use in patients with a history of these symptoms in association with bisphosphonate therapy.

- Gastrointestinal mucosa irritation: May cause irritation to upper gastrointestinal mucosa. Esophagitis, esophageal ulcers, esophageal erosions, and esophageal stricture (rare) have been reported with oral bisphosphonates; risk increases in patients unable to comply with dosing instructions. Use with caution in patients with dysphagia, esophageal disease, gastritis, duodenitis, or ulcers (may worsen underlying condition).

- Osteonecrosis of the jaw: Bisphosphonate therapy has been associated with osteonecrosis, primarily of the jaw; this has been observed mostly in cancer patients, but also in patients with postmenopausal osteoporosis and other diagnoses. Risk factors include a diagnosis of cancer, with concomitant chemotherapy, radiotherapy, or corticosteroids; anemia, coagulopathy, infection, or pre-existing dental disease. Symptoms included nonhealing extraction socket or an exposed jawbone. There are no data addressing whether discontinuation of therapy reduces the risk of developing osteonecrosis; however, as a precautionary measure, dental exams and preventative dentistry should be performed prior to placing patients with risk factors on chronic bisphosphonate therapy. Invasive dental procedures should be avoided during treatment.

Disease-related concerns:

- Enterocolitis: Use with caution in patients with enterocolitis; diarrhea has been reported at high doses and therapy may need to be withheld.

- Renal impairment: Use with caution in patients with renal impairment.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Bone mineralization: May retard mineralization of bone; treatment may need delayed or interrupted until callus is present.

- Calcium/vitamin D intake: Ensure adequate calcium and vitamin D intake.

Geriatric ConsiderationsMonitor serum electrolytes periodically since the elderly are often receiving diuretics which can result in decreases in serum calcium, potassium, and magnesium
Pregnancy Risk FactorC
Pregnancy ConsiderationsTeratogenic effects have been reported in some but not all animal studies. There are no adequate and well-controlled studies in pregnant women. Bisphosphonates are incorporated into the bone matrix and gradually released over time. Theoretically, there may be a risk of fetal harm when pregnancy follows the completion of therapy. Based on limited case reports with pamidronate, serum calcium levels in the newborn may be altered if administered during pregnancy.
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsFrequency not defined.

Gastrointestinal: Diarrhea, nausea

Neuromuscular & skeletal: Bone pain

Postmarketing and/or case reports: Agranulocytosis, alopecia, amnesia, angioedema, arthralgia, arthritis, asthma exacerbation, bone fracture, confusion, depression, esophagitis, follicular eruption, gastritis, glossitis, hallucination, headache, hypersensitivity reactions, leg cramps, leukopenia, macular rash, maculopapular rash, musculoskeletal pain (sometimes severe and/or incapacitating), osteomalacia, pancytopenia, paresthesia, peptic ulcer disease exacerbation, pruritus, Stevens-Johnson syndrome, urticaria

Oncology: Emetic PotentialLow
Drug Interactions

Aminoglycosides: May enhance the hypocalcemic effect of Bisphosphonate Derivatives. *Risk C: Monitor therapy*

Antacids: May decrease the absorption of Bisphosphonate Derivatives. Antacids containing aluminum, calcium, or magnesium are of specific concern. **Exceptions:** Magaldrate; Sodium Bicarbonate. *Risk D: Consider therapy modification*

Calcium Salts: May decrease the absorption of Bisphosphonate Derivatives. *Risk D: Consider therapy modification*

Iron Salts: May decrease the absorption of Bisphosphonate Derivatives. Only oral iron salts are of concern. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk D: Consider therapy modification*

Magnesium Salts: May decrease the absorption of Bisphosphonate Derivatives. Only oral magnesium salts are of concern. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of Bisphosphonate Derivatives. Both an increased risk of gastrointestinal ulceration and an increased risk of nephrotoxicity are of concern. *Risk C: Monitor therapy*

Phosphate Supplements: Bisphosphonate Derivatives may enhance the hypocalcemic effect of Phosphate Supplements. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: Food decreases the absorption and bioavailability of the drug.

Test InteractionsBisphosphonates may interfere with diagnostic imaging agents such as technetium-99m-diphosphonate in bone scans.

Monitoring ParametersSerum calcium and phosphorous; serum creatinine and BUN

Reference RangeCalcium (total): Adults: 9.0-11.0 mg/dL

Nursing: Physical Assessment/MonitoringAssess history for any previous adverse response to bisphosphonates and ability to comply with administration instructions. Use caution with renal impairment. Correct any hypocalcemia prior to beginning treatment. Patients at risk for osteonecrosis (eg, chemotherapy, corticosteroids, poor oral hygiene) should have dental exams and necessary preventive dentistry should be done before beginning bisphosphonate therapy. Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions (eg, immediate or long-term musculoskeletal pain). Teach appropriate use and specific administration directions, lifestyle and dietary changes according to purpose for use, possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber. Take with water or fruit juice on an empty stomach at least 30 minutes before any food. Do not take within 2 hours of food or dietary supplements containing calcium, iron, or magnesium. Consult prescriber to determine necessity of dietary supplements of calcium or increased dietary vitamin D. Certain dental procedures should be avoided if possible while you are taking this medication; consult prescriber. You may experience temporary nausea or vomiting (small frequent meals may help); diarrhea (boiled milk or yogurt may help); or bone pain (consult prescriber for analgesic). Report muscle twitching, unusual fever, convulsions, difficulty breathing, rash, bloody stool, pain in mouth, jaws or teeth, acute or lasting bone pain, or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant or if you are breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 200 mg, 400 mg

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Tablets (Didronel)

200 mg (30): $105.99

400 mg (30): $209.99

Mechanism of ActionDecreases bone resorption by inhibiting osteocystic osteolysis; decreases mineral release and matrix or collagen breakdown in bone

Pharmacodynamics/Kinetics

Onset of action: 1-3 months

Duration: Can persist for 12 months without continuous therapy

Absorption: ~3%

Metabolism: None

Half-life elimination: 1-6 hours

Excretion: Primarily urine (as unchanged drug); feces (as unabsorbed drug)

Dental Health Professional ConsiderationsThere is no data on the incidence of ONJ associated with use of etidronate disodium. A report by the Council of Scientific Affairs of the American Dental Association (accessed at: http://www.ada.org/prof/resources/topics/osteonecrosis.asp) as of July 2006 gave an estimated incidence of 0.7 cases for every 100,000 person-years of exposure to alendronate (Fosamax®). This translates to one case for every 142,857 person-years exposure. This figure from the ADA report was based on information received from Merck & Co citing 170 worldwide cases for alendronate (Fosamax®). In addition, Procter & Gamble Pharmaceuticals has cited 20 cases for risedronate (Actonel®) and Roche Laboratories has cited one case for ibandronate (Boniva®).

Consumer Reports On Health stated that the risk of jaw bone osteoporosis due to alendronate (Fosamax®), risedronate (Actonel®), or ibandronate (Boniva®) taken to prevent osteoporosis is very low and is estimated to be one out of every 20,000 users. That report mentioned that tooth extraction or implants increase the risk of developing osteonecrosis in patients taking any of these drugs for osteoporosis. The report also recommended that patients should stop taking any of these oral drugs 1-2 months before and after such dental treatment. No evidence was presented to support this statement.

In terms of length of exposure to oral bisphosphonates prior to onset of ONJ, data from large population studies or controlled studies is lacking. A report by Marx et al, observed that of three cases of ONJ associated with Fosamax® exposure, one patient had been taking 10 mg/day by mouth for 6 years and the other two patients 10 mg/day by mouth for 3 and 2 years respectively. In contrast, they observed that in cancer patients receiving intravenous bisphosphonates, the time period between the first doses of the bisphosphonate to first recognition of exposed bone either by the patients or by the clinician, was 9.4 months for zoledronate (Zometa®), 14.3 months for pamidronate (Aredia®), and 12.1 months for pamidronate then to zoledronate.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Abnormal taste.

Osteonecrosis of the jaw (ONJ), generally associated with local infection and/or tooth extraction and often with delayed healing, has been reported in patients taking bisphosphonates. Symptoms included nonhealing extraction socket or an exposed jawbone. Most reported cases of bisphosphonate-associated osteonecrosis have been in cancer patients treated with intravenous bisphosphonates. However, some have occurred in patients with postmenopausal osteoporosis taking oral bisphosphonates. Dental surgery may exacerbate ONJ. For patients requiring dental procedures, there are no data available to suggest whether discontinuation of bisphosphonate treatment reduces the risk of ONJ. Patients who develop ONJ while on bisphosphonate therapy should receive care by an oral surgeon. See Dental Comment.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentBisphosphonates have been associated with renal toxicity manifested as deterioration of renal function and potential renal failure. Use caution in patients receiving lithium.

Index TermsEHDP; Sodium Etidronate

Etidronate and Calcium

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(e ti DROE nate & KAL see um)

Canadian Brand NamesDidrocal™

Pharmacologic CategoryBisphosphonate Derivative; Calcium Salt

Use: Labeled IndicationsTreatment and prevention of postmenopausal osteoporosis; prevention of corticosteroid-induced osteoporosis

Dosing: Adults**Note:** 90-day treatment regimen involves sequential administration of two products within the packaging; not to be taken concurrently. The first blister card contains white tablets containing etidronate disodium, while the remaining four blister cards contains blue, capsule-shaped tablets containing calcium carbonate.

Osteoporosis: Oral: Etidronate disodium 400 mg once daily for 14 days, followed by calcium carbonate 1250 mg (500 mg elemental calcium) once daily for 76 days

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNot recommended for treatment in renally-impaired patients.

Administration: OralAdminister etidronate tablets with a full glass of water on an empty stomach 2 hours before meals. The calcium carbonate tablets may be administered with food.

Dietary Considerations

Etidronate: Administer tablet with water on an empty stomach; avoid administering foods/supplements with calcium, iron, or magnesium within 2 hours of drug; maintain adequate intake of calcium and vitamin D.

Calcium: As a dietary supplement, should be given with meals to increase absorption. May decrease iron absorption, so should be administered 1-2 hours before or after iron supplementation; limit intake of with bran, foods high in oxalates, or whole grain cereals which may decrease calcium absorption. Dietary calcium should be adjusted to supply at least 1500 mg/day (Didrocal™ supplies 500 mg/day), and dietary vitamin D intake should provide 400 int. units/day.

StorageStore at 15°C to 30°C (59°F to 86°F).

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to etidronate disodium, bisphosphonates, or any component of the formulation; clinically-overt osteomalacia (appropriate treatment to resolve osteomalacia should be initiated before prescribing Didrocal™ therapy).

Warnings/Precautions

Concerns related to adverse effects:

- Bone/joint/muscle pain: Infrequently, severe (and occasionally debilitating) bone, joint, and/or muscle pain have been reported during bisphosphonate treatment. The onset of pain ranged from a single day to several months. Symptoms usually resolve upon discontinuation. Some patients experienced recurrence when rechallenged with same drug or another bisphosphonate; avoid use in patients with a history of these symptoms in association with bisphosphonate therapy.

- Gastrointestinal mucosa irritation: May cause irritation to upper gastrointestinal mucosa. Esophagitis, esophageal ulcers, esophageal erosions, and esophageal stricture (rare) have been reported with oral bisphosphonates; risk increases in patients unable to comply with dosing instructions. Use with caution in patients with dysphagia, esophageal disease, gastritis, duodenitis, or ulcers (may worsen underlying condition).

- Osteonecrosis of the jaw: Bisphosphonate therapy has been associated with osteonecrosis, primarily of the jaw; this has been observed mostly in cancer patients, but also in patients with postmenopausal osteoporosis and other diagnoses. Risk factors include a diagnosis of cancer, with concomitant chemotherapy, radiotherapy, or corticosteroids; anemia, coagulopathy, infection, or pre-existing dental disease. Symptoms included nonhealing extraction socket or an exposed jawbone. There are no data addressing whether discontinuation of therapy reduces the risk of developing osteonecrosis; however, as a precautionary measure, dental exams and preventative dentistry should be performed prior to placing patients with risk factors on chronic bisphosphonate therapy. Invasive dental procedures should be avoided during treatment.

Disease-related concerns:

- Hypoparathyroidism: While hypercalcemia and hypercalciuria may result when therapeutic replacement amounts are given for prolonged periods, they are most likely to occur in hypoparathyroid patients receiving high doses of vitamin D.

- Renal impairment: Use with caution in patients with renal impairment; I.V. form of etidronate has been noted to be nephrotoxic; therefore, this drug should be used with caution, if at all, in patients with impaired renal function or a history of kidney stones. There is no specific experience to guide cyclic therapy in patients with renal impairment or a history of renal calculi; monitor urine calcium and other relevant parameters if therapy is implemented.

Special populations:

- Calcium/vitamin D restricted patients: Use with caution in patients with restricted calcium and vitamin D intake.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Absorption: Calcium carbonate absorption is impaired in achlorhydria (common in elderly); administer calcium component with food.

Pregnancy Risk FactorC (based on U.S. labeling)
Pregnancy ConsiderationsEtidronate: Teratogenic effects have been reported in some but not all animal studies. There are no adequate and well-controlled studies in pregnant women. Bisphosphonates are incorporated into the bone matrix and gradually released over time. Theoretically, there may be a risk of fetal harm when pregnancy follows the completion of therapy. Based on limited case reports with pamidronate, serum calcium levels in the newborn may be altered if administered during pregnancy.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions

>10%:

Central nervous system: Dizziness (16%), headache (13%)

Gastrointestinal: Diarrhea (37%), nausea (18%), flatulence (17%), constipation (13%), dyspepsia (12%), vomiting (11%)

<1%, postmarketing, and/or case reports: Agranulocytosis, alopecia, amnesia, angioedema, arthropathies, asthma exacerbation, bone fracture, burning tongue, confusion, depression, erythema multiforme, esophagitis, follicular eruption, glossitis, hallucinations, leukopenia, leukemia (1 in 100,000 patients), musculoskeletal pain, pancytopenia, paresthesia, peptic ulcer disease (exacerbation), rash (maculopapular), Stevens-Johnson syndrome, urticaria

Drug InteractionsThere are no known significant interactions.
Ethanol/Nutrition/Herb Interactions

Food: Food decreases the absorption and bioavailability of the etidronate.

Test InteractionsBisphosphonates may interfere with diagnostic imaging agents such as technetium-99m-diphosphonate in bone scans.
Monitoring ParametersBone mass should be monitored; if not stabilized within 4 cycles (1 year) of therapy, consider discontinuation of treatment
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Combination package [each package contains five blister cards (90-day supply)]:

Didrocal™ [CAN; not available in the U.S.]

Tablet, etidronate disodium 400 mg (14s) [first card (white tablets)]

Tablet, calcium carbonate: 1250 mg (76s) [equivalent to elemental calcium 500 mg; remaining cards (blue tablets)]

ManufacturerProcter & Gamble Pharmaceuticals Canada
Mechanism of ActionSee individual agents.
Pharmacodynamics/KineticsSee individual agents.
Related Information

- Calcium Carbonate
- Etidronate Disodium

Dental Health Professional ConsiderationsSee Etidronate Disodium monograph.
Dental Health: Effects on Dental TreatmentOsteonecrosis of the jaw (ONJ), generally associated with local infection and/or tooth extraction and often with delayed healing, has been reported in patients taking bisphosphonates. Symptoms included nonhealing extraction socket or an exposed jawbone. Most reported cases of bisphosphonate-associated osteonecrosis have been in cancer patients treated with intravenous bisphosphonates. However, some have occurred in patients with postmenopausal osteoporosis taking oral bisphosphonates. Dental surgery may exacerbate ONJ. For patients requiring dental procedures, there are no data available to suggest whether discontinuation of bisphosphonate treatment reduces the risk of ONJ. Patients who develop ONJ while on bisphosphonate therapy should receive care by an oral surgeon. See Dental Comment in Etidronate Disodium monograph.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause dizziness
Mental Health: Effects on Psychiatric TreatmentBisphosphonates have been associated with renal toxicity manifested as deterioration of renal function and potential renal failure. use caution in patients receiving lithium. GI side effects are common, concurrent use with SSRIs, lithium, valproic acid, or carbamazepine may produce additive effects.
Index TermsCalcium Carbonate and Etidronate Disodium

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Lodine® may be confused with codeine, iodine, Iopidine®, Lopid®

Pronunciation(ee toe DOE lak)

Canadian Brand NamesApo-Etodolac®; Utradol™

Pharmacologic CategoryNonsteroidal Anti-inflammatory Drug (NSAID), Oral

Use: Labeled IndicationsAcute and long-term use in the management of signs and symptoms of osteoarthritis; rheumatoid arthritis and juvenile rheumatoid arthritis; management of acute pain

Use: DentalManagement of postoperative pain

Dosing: Adults **Note:** For chronic conditions, response is usually observed within 2 weeks.

Acute pain: Oral: 200-400 mg every 6-8 hours, as needed, not to exceed total daily doses of 1000 mg

Rheumatoid arthritis, osteoarthritis: Oral: 400 mg 2 times/day **or** 300 mg 2-3 times/day **or** 500 mg 2 times/day (doses >1000 mg/day have not been evaluated)

Lodine® XL: 400-1000 mg once daily

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric **Note:** For chronic conditions, response is usually observed within 2 weeks.

Juvenile rheumatoid arthritis (Lodine® XL): Oral: Children 6-16 years:

20-30 kg: 400 mg once daily

31-45 kg: 600 mg once daily

46-60 kg: 800 mg once daily

Children >60 kg: 1000 mg once daily

Dosing: Renal Impairment
Mild to moderate: No adjustment required

Severe: Use not recommended; use with caution

Hemodialysis: Not removed

Dosing: Hepatic ImpairmentNo adjustment required.

Dietary ConsiderationsMay be taken with food to decrease GI distress.

StorageStore at 20°C to 25°C (68°F to 77°F). Protect from moisture.

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an oral outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to etodolac, aspirin, other NSAIDs, or any component of the formulation; perioperative pain in the setting of coronary artery bypass graft (CABG) surgery

Allergy Considerations

- Nonsteroidal Anti-inflammatory Drug (NSAID) Allergy

Warnings/Precautions

Boxed warnings:

• Cardiovascular events: See “Concerns related to adverse effects” below.

• Coronary artery bypass graft surgery: See “Disease-related concerns” below.

• Gastrointestinal events: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Anaphylactoid reactions: Even in patients without prior exposure anaphylactoid reactions may occur; patients with "aspirin triad" (bronchial asthma, aspirin intolerance, rhinitis) may be at increased risk. Do not use in patients who experience bronchospasm, asthma, rhinitis, or urticaria with NSAID or aspirin therapy.

- Bleeding/hemostasis: Platelet adhesion and aggregation may be decreased; may prolong bleeding time; patients with coagulation disorders or who are receiving anticoagulants should be monitored closely. Anemia may occur; patients on long-term NSAID therapy should be monitored for anemia.

- Cardiovascular events: **[U.S. Boxed Warning]: NSAIDs are associated with an increased risk of adverse cardiovascular thrombotic events, including MI, stroke, and new onset or worsening of pre-existing hypertension.** Risk may be increased with duration of use or pre-existing cardiovascular risk factors or disease. Carefully evaluate individual cardiovascular risk profiles prior to prescribing. Use caution with fluid retention, heart failure, or hypertension. Concurrent administration of ibuprofen, and potentially other nonselective NSAIDs, may interfere with aspirin's cardioprotective effect. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of cardiovascular events; alternate therapies should be considered for patients at high risk.

- Gastrointestinal events: **[U.S. Boxed Warning]: NSAIDs may increase risk of gastrointestinal irritation, inflammation, ulceration, bleeding, and perforation.** These events may occur at any time during therapy and without warning. Use caution with a history of GI disease (bleeding or ulcers), concurrent therapy with aspirin, anticoagulants and/or corticosteroids, smoking, use of alcohol, the elderly or debilitated patients. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of GI adverse events; alternate therapies should be considered for patients at high risk.

- Skin reactions: NSAIDs may cause serious skin adverse events including exfoliative dermatitis, Stevens-Johnson syndrome (SJS), and toxic epidermal necrolysis (TEN); discontinue use at first sign of skin rash or hypersensitivity.

Disease-related concerns:

- Asthma: Do not administer to patients with aspirin-sensitive asthma; severe bronchospasm may occur. Use caution in patients with other forms of asthma.

- Coronary artery bypass graft surgery: **[U.S. Boxed Warning]: Use is contraindicated for treatment of perioperative pain in the setting of coronary artery bypass graft (CABG) surgery.** Risk of MI and stroke may be increased with use following CABG surgery.

- Hepatic impairment: Use with caution in patients with decreased hepatic function. Closely monitor patients with any abnormal LFT. Severe hepatic reactions (eg, fulminant hepatitis, liver failure) have occurred with NSAID use, rarely; discontinue if signs or symptoms of liver disease develop, or if systemic manifestations occur.

- Renal impairment: NSAID use may compromise existing renal function; dose-dependent decreases in prostaglandin synthesis may result from NSAID use, reducing renal blood flow which may cause renal decompensation. Patients with impaired renal function, dehydration, heart failure, liver dysfunction, those taking diuretics and ACE inhibitors, and the elderly are at greater risk for renal toxicity. Rehydrate patient before starting therapy; monitor renal function closely. Not recommended for use in patients with advanced renal disease. Long-term NSAID use may result in renal papillary necrosis.

Special populations:

- Elderly: The elderly are at increased risk for adverse effects (especially peptic ulceration, CNS effects, renal toxicity) from NSAIDs even at low doses.

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Extended release formulation: Use of extended release product consisting of a nondeformable matrix should be avoided in patients with stricture/narrowing of the GI tract; symptoms of obstruction have been associated with nondeformable products.

Other warnings/precautions:

- Surgical/dental procedures: Withhold for at least 4-6 half-lives prior to surgical or dental procedures.

Geriatric ConsiderationsThe elderly are a high-risk population for adverse effects from nonsteroidal anti-inflammatory agents. As much as 60% of older adults who experience GI side effects can develop peptic ulceration and/or hemorrhage asymptomatically. The concomitant use of H_2 blockers and sucralfate is not effective as prophylaxis with the exception of NSAID-induced duodenal ulcers which may be prevented by the use of ranitidine. Misoprostol and proton pump inhibitors are the only agents proven to help prevent the development of NSAID-induced ulcers. Also, concomitant disease and drug use contribute to the risk for GI adverse effects. Use lowest effective dose for shortest period possible. Consider renal function decline with age. Use of NSAIDs can compromise existing renal function especially when Cl_{cr} is ≤30 mL/minute.

Tinnitus may be a difficult and unreliable indication of toxicity due to age-related hearing loss or eighth cranial nerve damage. CNS adverse effects such as confusion, agitation, and hallucination are generally seen in overdose or high dose situations, but older adults may demonstrate these adverse effects at lower doses than younger adults. In patients ≥65 years, no substantial differences in the pharmacokinetics or side-effects profile were seen compared with the general population. Studies with etodolac in elderly demonstrated no difference in safety or efficacy compared to younger adults. No dosing adjustment necessary in elderly.

Pregnancy Risk FactorC/D (3rd trimester)
LactationExcretion in breast milk unknown/not recommended
Adverse Reactions

1% to 10%:

Central nervous system: Dizziness (3% to 9 %), chills/fever (1% to 3%), depression (1% to 3%), nervousness (1% to 3%)

Dermatologic: Rash (1% to 3%), pruritus (1% to 3%)

Gastrointestinal: Abdominal cramps (3% to 9%), nausea (3% to 9%), vomiting (1% to 3%), dyspepsia (10%), diarrhea (3% to 9%), constipation (1% to 3%), flatulence (3% to 9%), melena (1% to 3%), gastritis (1% to 3%)

Genitourinary: Dysuria (1% to 3%)

Neuromuscular & skeletal: Weakness (3% to 9%)

Ocular: Blurred vision (1% to 3%)

Otic: Tinnitus (1% to 3%)

Renal: Polyuria (1% to 3%)

<1%: Agranulocytosis, allergic reaction, allergic/necrotizing vasculitis, alopecia, anaphylactic/anaphylactoid reactions, anemia, angioedema, anorexia, arrhythmia, aseptic meningitis, asthma, bleeding time increased, CHF, confusion, conjunctivitis, CVA, cystitis, duodenitis, dyspnea, ecchymosis, edema, erythema multiforme, esophagitis (+/- stricture or cardiospasm), exfoliative dermatitis, GI ulceration, hallucination, headache, hearing decreased, hematemesis, hematuria, hepatic failure, hepatitis, hyperglycemia (in controlled patients with diabetes), hyperpigmentation, hypertension, infection, insomnia, interstitial nephritis, irregular uterine bleeding, jaundice, LFTs increased, leukopenia, MI, palpitation, pancreatitis, pancytopenia, paresthesia, peptic ulcer (+/- bleeding/perforation), peripheral neuropathy, photophobia, photosensitivity, pulmonary infiltration (eosinophilia), rectal bleeding, renal calculus, renal failure, renal insufficiency, shock, Stevens-Johnson syndrome, syncope, thrombocytopenia, toxic epidermal necrolysis, ulcerative stomatitis, urticaria, vesiculobullous rash, renal papillary necrosis, visual disturbances

Drug Interactions

ACE Inhibitors: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Aminoglycosides: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Aminoglycosides. Data only in premature infants. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Anticoagulants: Nonsteroidal Anti-Inflammatory Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Antiplatelet Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

Beta-Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Nonsteroidal Anti-Inflammatory Agents. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Bisphosphonate Derivatives. Both an increased risk of gastrointestinal ulceration and an increased risk of nephrotoxicity are of concern. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

CycloSPORINE: Nonsteroidal Anti-Inflammatory Agents may enhance the nephrotoxic effect of CycloSPORINE. Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

Desmopressin: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Eplerenone: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Eplerenone. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk D: Consider therapy modification*

HydrALAZINE: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of HydrALAZINE. *Risk C: Monitor therapy*

Ketorolac: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. *Risk X: Avoid combination*

Lithium: Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the diuretic effect of Loop Diuretics. *Risk C: Monitor therapy*

Methotrexate: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Methotrexate. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of other Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Pemetrexed: NSAID (Nonselective) may decrease the excretion of Pemetrexed. *Risk D: Consider therapy modification*

Probenecid: May increase the serum concentration of Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: Nonsteroidal Anti-Inflammatory Agents may enhance the neuroexcitatory and/or seizure-potentiating effect of

Quinolone Antibiotics. *Risk C: Monitor therapy*

Salicylates: NSAID (Nonselective) may enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Choline Magnesium Trisalicylate. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk D: Consider therapy modification*

Thiazide Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Thrombolytic Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk C: Monitor therapy*

Vancomycin: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Vancomycin. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): NSAID (Nonselective) may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may enhance gastric mucosal irritation).

Food: Etodolac peak serum levels may be decreased if taken with food.

Herb/Nutraceutical: Avoid alfalfa, anise, bilberry, bladderwrack, bromelain, cat's claw, celery, chamomile, coleus, cordyceps, dong quai, evening primrose, fenugreek, feverfew, garlic, ginger, ginkgo biloba, ginseng (American, Panax, Siberian), grapeseed, green tea, guggul, horse chestnut seed, horseradish, licorice, prickly ash, red clover, reishi, SAMe (S-adenosylmethionine), sweet clover, turmeric, white willow (all have additional antiplatelet activity).

Test InteractionsFalse-positive for urinary bilirubin and ketone

Monitoring ParametersMonitor CBC and chemistry profile, liver enzymes; in patients with an increased risk for renal failure (CHF or decreased renal function, taking ACE inhibitors or diuretics, elderly), monitor urine output and BUN/serum creatinine

Nursing: Physical Assessment/MonitoringEvaluate cardiac risk and potential for GI bleeding prior to prescribing this medication. Assess effectiveness and interactions of other medications patient may be taking. Monitor blood pressure at the beginning of therapy and periodically during use. Assess results of laboratory tests and therapeutic and adverse reactions at beginning of therapy and periodically throughout therapy. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsCBC, liver enzymes; in patients receiving diuretics, monitor BUN/serum creatinine.

Patient EducationTake this medication exactly as directed; do not increase dose without consulting prescriber. Do not crush tablets or break capsules. Take with food or milk to reduce GI distress. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Do not use alcohol, aspirin or aspirin-containing medication, or any other anti-inflammatory medications without consulting prescriber. You may experience anorexia, nausea, vomiting, or heartburn (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); drowsiness, dizziness, nervousness, or headache (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or fluid retention (weigh yourself weekly and report unusual [3-5 lb/week] weight gain). GI bleeding, ulceration, or perforation can occur with or without pain; discontinue medication and contact prescriber if persistent abdominal pain or cramping, or blood in stool occurs. Report breathlessness, respiratory difficulty, or unusual cough; chest pain, rapid heartbeat, palpitations; unusual bruising/bleeding; blood in urine, stool, mouth, or vomitus; swollen extremities; skin rash, blisters, or itching; acute fatigue; fever; jaundice; abdominal tenderness; flu-like symptoms; or hearing changes (ringing in ears). **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. This drug should not be used in the 3rd trimester of pregnancy. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 200 mg, 300 mg

Tablet: 400 mg, 500 mg

Tablet, extended release: 400 mg, 500 mg, 600 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Capsules (Etodolac)

300 mg (60): $31.99

Tablet, 24-hour (Etodolac CR)

400 mg (30): $32.99

500 mg (30): $34.99

600 mg (30): $64.99

Tablets (Etodolac)

400 mg (60): $38.99

500 mg (60): $37.00

Mechanism of ActionReversibly inhibits cyclooxygenase-1 and 2 (COX-1 and 2) enzymes, which result in decreased formation of prostaglandin precursors; has antipyretic, analgesic, and anti-inflammatory properties

Pharmacodynamics/Kinetics

Onset of action: Analgesic: 2-4 hours; Maximum anti-inflammatory effect: A few days

Absorption: ≥80%

Distribution: V_d:

Immediate release: Adults:0.4 L/kg

Extended release: Adults: 0.57 L/kg; Children (6-16 years): 0 .08 L/kg

Protein binding: ≥99%, primarily albumin

Metabolism: Hepatic

Half-life elimination: Terminal: Adults: 5-8 hours

Extended release: Children (6-16 years): 12 hours

Time to peak, serum:

Immediate release: Adults: 1-2 hours

Extended release: Extended release: 5-7 hours, increased 1.4-3.8 hours with food

Excretion: Urine 73% (1% unchanged); feces 16%

Related Information

- Nonsteroidal Anti-inflammatory Agents

Dental Health: Effects on Dental TreatmentNSAID formulations are known to reversibly decrease platelet aggregation via mechanisms different than observed with aspirin. The dentist should be aware of the potential of abnormal coagulation. Caution should also be exercised in the use of NSAIDs in patients already on anticoagulant therapy with drugs such as warfarin (Coumadin®).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness is common; may cause nervousness; rarely produces confusion, depression, insomnia, or hallucinations

Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine and carbamazepine; may decrease the clearance of lithium resulting in elevated serum levels and potential toxicity; monitor serum lithium levels

Cardiovascular Considerations

Blood Pressure: In short-term use, NSAIDs vary considerably in their effect on blood pressure. A recent meta-analysis (see References) showed that indomethacin and naproxen had the largest effect on blood pressure. Other NSAIDs, including piroxicam, ibuprofen, and sulindac had less of an effect. Ibuprofen combined with captopril or losartan may attenuate the antihypertensive effects of ACE inhibition or receptor blockade on sitting or 24-hour ambulatory diastolic blood pressure. When NSAIDs are used in patients with hypertension, appropriate monitoring of blood pressure responses should be completed and the duration of therapy, when possible, kept short.

Heart Failure: The use of NSAIDs in the treatment of patients with congestive heart failure may be associated with an increased risk for fluid accumulation and edema. One study showed that NSAID use in elderly patients had an increased risk of hospitalization for heart failure. This study gives compelling reasons to avoid or limit the use of NSAIDs in patients with congestive heart failure, particularly in the elderly population. The ACC/AHA 2005 chronic heart failure guidelines suggest that NSAIDs be avoided or withdrawn whenever possible in patients with current or prior symptoms of heart failure and reduced LVEF.

Risk of Cardiovascular Events: Patients at increased risk of cardiovascular adverse events include patients immediately postoperative from CABG surgery, and those with existing CAD, CVD, or history of TIA. Prescribers are encouraged to use the lowest effective dose for the shortest duration of time based on individual patient treatment goals. Available evidence reviewed by the FDA does not suggest an increased risk of serious CV events when NSAIDs are given short term and in the lower doses used OTC.

Drug Interactions: Nonsteroidal anti-inflammatory agents, including ibuprofen and naproxen, may diminish the cardioprotective effect of aspirin (Catella-Lawson F, 2001; Capone ML, 2005). It is surmised that ibuprofen may exhibit greater affinity than aspirin for the COX-1 site or if dosed regularly (or prior to aspirin), it would gain access to the active site first. In either case, aspirin's inhibition of COX (irreversible) would be limited in favor of ibuprofen inhibition (reversible). Avoid regular use of NSAIDs (nonselective) if possible. If used occasionally, take after aspirin (immediate release) ingestion.

Anesthesia and Critical Care Concerns/Other ConsiderationsThe 2002 ACCM/SCCM guidelines for analgesia (critically-ill adult) suggest that NSAIDs may be used in combination with opioids in select patients for pain management. Concern about adverse events (increased risk of renal dysfunction, altered platelet function and gastrointestinal irritation) limits its use in patients who have other underlying risks for these events.

In short-term use, NSAIDs vary considerably in their effect on blood pressure. When NSAIDs are used in patients with hypertension, appropriate monitoring of blood pressure responses should be completed and the duration of therapy, when possible, kept short. The use of NSAIDs in the treatment of patients with congestive heart failure may be associated with an increased risk for fluid accumulation and edema. May precipitate renal failure in dehydrated patients.

Index TermsEtodolic Acid

Etomidate

Lexi-Drugs Online

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Etomidate may be confused with etidronate

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(e TOM i date)

U.S. Brand NamesAmidate®

Canadian Brand NamesAmidate®

Pharmacologic CategoryGeneral Anesthetic

Use: Labeled IndicationsInduction and maintenance of general anesthesia

Use: Unlabeled/InvestigationalSedation for diagnosis of seizure foci

Dosing: AdultsAnesthesia: I.V.: Initial: 0.2-0.6 mg/kg over 30-60 seconds for induction of anesthesia; maintenance: 5-20 mcg/kg/minute

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricChildren >10 years: Refer to adult dosing.

Administration: I.V.Administer I.V. push over 30-60 seconds. Solution is highly irritating; avoid administration into small vessels; in some cases, preadministration of lidocaine may be considered.

StorageStore at room temperature.

Compatibility

Y-site administration: Compatible: Alfentanil, atracurium, atropine, doxacurium, ephedrine, fentanyl, lidocaine, lorazepam, midazolam, mivacurium, morphine, pancuronium, phenylephrine, succinylcholine, sufentanil. **Incompatible:** Ascorbic acid, vecuronium.

ContraindicationsHypersensitivity to etomidate or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal steroid production: Etomidate inhibits 11-B-hydroxylase, an enzyme important in adrenal steroid production. A single induction dose blocks the normal stress-induced increase in adrenal cortisol production for 4-8 hours, up to 24 hours in elderly and debilitated patients. Continuous infusion of etomidate for sedation in the ICU may increase mortality because patients may not be able to respond to stress. No increase in mortality has been identified with a single dose for induction of anesthesia. Consider exogenous corticosteroid replacement in patients undergoing severe stress.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <10 years of age.

Pregnancy Risk FactorC

Adverse Reactions

>10%:

Endocrine & metabolic: Adrenal suppression

Gastrointestinal: Nausea, vomiting on emergence from anesthesia

Local: Pain at injection site (30% to 80%)

Neuromuscular & skeletal: Myoclonus (33%), transient skeletal movements, uncontrolled eye movements

1% to 10%: Hiccups

<1%: Apnea, arrhythmia, bradycardia, cortisol synthesis decreased, hyper-/hypotension, hyper-/hypoventilation, laryngospasm, tachycardia

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersCardiac monitoring and blood pressure required

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Assess results of laboratory tests, therapeutic effect, and adverse/toxic effects, particularly for signs of adrenal insufficiency (including hypotension, hyperkalemia). Monitor respiratory status (for conscious sedation, includes pulse oximetry), cardiovascular status, CNS status (when used for procedures monitor sedation score); cardiac monitor and blood pressure monitor required. Infusion site should be monitored closely due to potential irritation (see Administration).

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: 2 mg/mL (10 mL, 20 mL) [contains propylene glycol 35% v/v]

Generic AvailableYes
Mechanism of ActionUltrashort-acting nonbarbiturate hypnotic (benzylimidazole) used for the induction of anesthesia; chemically, it is a carboxylated imidazole which produces a rapid induction of anesthesia with minimal cardiovascular effects; produces EEG burst suppression at high doses
Pharmacodynamics/Kinetics

Onset of action: 30-60 seconds

Peak effect: 1 minute

Duration: 3-5 minutes; terminated by redistribution

Distribution: V_d: 2-4.5 L/kg

Protein binding: 76%;

Metabolism: Hepatic and plasma esterases

Half-life elimination: Terminal: 2.6 hours

Pharmacotherapy PearlsEtomidate decreases cerebral metabolism and cerebral blood flow while maintaining perfusion pressure. Premedication with opioids or benzodiazepines can decrease myoclonus. Etomidate can enhance somatosensory evoked potential recordings.
Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Hiccups.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported
Cardiovascular ConsiderationsEtomidate is a relatively safe anesthetic for use in patients with stable cardiovascular disease.
Anesthesia and Critical Care Concerns/Other ConsiderationsEtomidate 2 mg/mL contains propylene glycol 362.6 mg/mL (35% v/v).

Etomidate decreases cerebral metabolism and cerebral blood flow while maintaining perfusion pressure; can enhance somatosensory evoked potential recordings. Premedication with opioids or benzodiazepines can decrease myoclonus. Etomidate is a relatively safe anesthetic for use in patients with stable cardiovascular disease.

International Brand NamesEtomidat-Lipuro (CH, LU); Etomidate-Lipuro (PL); Etomidato-Lipuro (AR); Hypnomidate (AT, BE, BG, BR, CH, CZ, DE, ES, FR, GB, GR, HR, IE, LU, MX, NL, PL, PT, PY, RU, TR, TW, ZA); Radenarcon (PL)

Etonogestrel

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(e toe noe JES trel)

U.S. Brand NamesImplanon™

Pharmacologic CategoryContraceptive; Progestin

Use: Labeled IndicationsPrevention of pregnancy; for use in women who request long-acting (up to 3 years) contraception

Dosing: AdultsContraception: Subdermal: Implant 1 rod in the inner side of the upper, nondominant arm. Remove no later than 3 years after the date of insertion. After ruling out pregnancy, timing of insertion is based on the patient's contraceptive history:

No hormonal contraceptives within the past month: Insert between days 1 through 5 of menstruation, even if woman is still bleeding

Switching from combination hormonal contraceptive:

Oral tablet: Insert anytime within 7 days after the last active tablet

Vaginal ring: Insert anytime during the 7-day ring-free period

Transdermal system: Insert anytime during the 7-day patch-free period

Switching from a progestin-only contraceptive:

Oral pill: Any day during the month; do not skip days between the last pill and implant insertion

Implant: Insert on same day as removal of implant

IUD: Insert on same day as removal of IUD

Injection: Insert on day next injection is due

First trimester abortion or miscarriage: Insert immediately. If not inserted within first 5 days follow directions for “no hormonal contraception within the past month”

Following delivery or second trimester abortion: May insert between 21 and 28 days (if not exclusively breast-feeding) or after 4 weeks (if exclusively breast-feeding). Patients should use a second form of contraception for the first 7 days if insertion occurs at >4 weeks.

Note: If following above insertion schedule, no back-up contraception needed. If deviating, use back-up method for 7 days postinsertion.

Dosing: ElderlyNot for use after menopause

Dosing: PediatricNot for use prior to menarche

Dosing: Renal ImpairmentUse with caution; formal studies have not been conducted.

Dosing: Hepatic ImpairmentUse is contraindicated.

Administration: OtherSubdermal: For insertion under local anesthesia by healthcare providers trained in the insertion and removal procedure. Rod must be palpable after insertion. Deep insertion may require surgery to remove. If rod is impalpable, ultrasound should be used to locate the rod; MRI may also be useful if ultrasound is not successful. A pressure bandage should be applied and left in place for 24 hours after insertion to decrease bruising; a small bandage placed over the insertion site should remain in place for 3-5 days.

StorageStore at controlled room temperature 15°C to 30°C (59°F to 86°F). Protect from light.

RestrictionsOnly healthcare providers who have undergone training in the insertion and removal procedures will be able to order Implanon™.

ContraindicationsHypersensitivity to etonogestrel or any component of the formulation; undiagnosed abnormal uterine bleeding; active hepatic disease or malignant tumors; active thrombophlebitis or thromboembolic disorders (current or history of); known or suspected carcinoma of the breast; concomitant use with chronic potent hepatic enzyme inducers; pregnancy

Warnings/Precautions

Concerns related to adverse effects:

- Bleeding irregularities: Abnormal bleeding should be evaluated as required to exclude pathologic conditions or pregnancy.
- Ectopic pregnancy: Rarely, may occur more commonly than in women using no contraception.
- Thromboembolism: Combination hormonal contraceptives may increase the risk of thromboembolism (also reported with etonogestrel).

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment.

Concurrent drug therapy issues:

- Hepatic enzyme inducers: Etonogestrel serum levels and contraceptive efficacy may be significantly decreased by potent hepatic enzyme inducer; the manufacturer does not recommend use in women chronically taking hepatic enzyme inducers.

Special populations:

- Obesity: Use with caution in overweight women; women >130% of ideal body weight were not included in clinical studies.
- Pediatrics: Not for use prior to menarche.

Other warnings/precautions:

- Appropriate use: Improper insertion may lead to unintended pregnancy or may cause difficult or impossible removal. Failure to properly remove may lead to infertility, ectopic pregnancy, or continued adverse reactions. Menstrual bleeding patterns are likely to be altered; patients should be counseled prior to implant insertion.
- HIV infection protection: Use does not protect against HIV infection or other sexually-transmitted diseases.

Additional concerns reported with combination oral contraceptives:

- Breast cancer: Use has been associated with a slight increase in frequency of breast cancer, however, studies are not consistent.
- Cardiovascular disease: Use with caution in patients with risk factors for coronary artery disease; may lead to increased risk of myocardial infarction. May have a dose-related risk of vascular disease and hypertension; women with hypertension should be encouraged to use a nonhormonal form of contraception.
- Depression: Use with caution in patients with depression.
- Diseases exacerbated by fluid retention: Use with caution in patients with diseases which may be exacerbated by fluid retention, including asthma, epilepsy, migraine, diabetes or renal dysfunction.
- Gallbladder disease: May have a dose-related risk of gallbladder disease.
- Glucose intolerance: May cause glucose intolerance.
- Lipid effects: May effect serum triglyceride and lipoprotein levels. Estrogen compounds are generally associated with lipid effects such as increased HDL-cholesterol and decreased LDL-cholesterol. Triglycerides may also be increased; use with caution in patients with familial defects of lipoprotein metabolism.
- Migraine: Use with caution in patients with a history of migraine.
- Retinal vascular thrombosis: Estrogens may cause retinal vascular thrombosis (has been reported rarely with combination hormonal contraceptives); discontinue permanently if papilledema or retinal vascular lesions are observed on examination.
- Smokers: The risk of cardiovascular side effects increases in women who smoke cigarettes, especially those who are >35 years of age; women who use combination hormonal contraceptives should be strongly advised not to smoke.
- Surgical patients: Whenever possible, therapy should be discontinued at least 4 weeks prior to and for 2 weeks following elective surgery associated with an increased risk of thromboembolism or during periods of prolonged immobilization.

⇧ Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. Not for use during pregnancy; remove implant if pregnancy is detected. Ovulation may return within 1 week of implant removal; alternate forms of contraception may be required. In a multicenter clinical trial, 11 out of 46 women no longer using contraception became pregnant between 1 and 18 weeks following removal of the implant. Do not insert <21 days postpartum. Women weighing >130% of their ideal body weight were not included in clinical studies. With oral combination hormonal contraceptives, an increase in contraceptive failure was noted in women with a BMI >27.3. Similar findings were noted in patients weighing ≥90 kg (198 lb) using the contraceptive patch.

⇧ LactationEnters breast milk/use caution

⇧ Breast-Feeding ConsiderationsEtonogestrel was not found to affect the quality or quantity of breast milk. Do not insert <21 days postpartum. Levels of etonogestrel are highest during the first month following insertion (~2.2% of the weight-adjusted maternal daily dose).

⇧ Adverse Reactions

>10%:

Central nervous system: Headache (25%)

Dermatologic: Acne (14%)

Endocrine & metabolic: Infrequent menstrual bleeding (<3 episodes/90 days: 34%), amenorrhea (no bleeding in 90 days: 22%), prolonged menstrual bleeding (lasting >14 days: 18%), breast pain (13%), menstrual bleeding irregularities requiring discontinuation (11%)

Gastrointestinal: Weight gain (14%), abdominal pain (11%)

Genitourinary: Vaginitis (15%)

Respiratory: Upper respiratory tract infection (13%), pharyngitis (11%)

5% to 10%:

Central nervous system: Dizziness (7%), emotional lability (7%), depression (6%), nervousness (6%), pain (6%)

Endocrine & metabolic: Dysmenorrhea (7%), frequent menstrual bleeding (>5 episodes/90 days: 7%)

Gastrointestinal: Nausea (6%)

Genitourinary: Leukorrhea (10%)

Local: Insertion site pain (5%)

Neuromuscular & skeletal: Back pain (7%)

Respiratory: Sinusitis (6%)

Miscellaneous: Flu-like syndrome (8%)

<5% (Limited to important or life-threatening): Allergic reaction, alopecia, anorexia, anxiety, appetite increased, arthralgia, asthma, breast discharge, breast enlargement, breast fibroadenosis, cervical smear test positive, constipation, coughing, crying, diarrhea, dyspepsia, dysuria, edema, fatigue, fever, flatulence, gastritis, hot flushes, hypertension, hypoesthesia, injection site reaction, insomnia, lactation nonpuerperal, libido decreased, migraine, myalgia, otitis media, ovarian cyst, pelvic cramping, premenstrual tension, pruritus, rash, rhinitis, sexual function abnormal, skeletal pain, somnolence, vaginal discomfort, varicose vein, vision abnormal, vomiting, weakness, weight loss

Metabolism/Transport Effects **Substrate** of CYP3A4 (minor)

Drug Interactions

Acitretin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Aminoglutethimide: May increase the metabolism of Progestins. *Risk D: Consider therapy modification*

Aprepitant: May decrease the serum concentration of Contraceptive (Progestins). *Risk D: Consider therapy modification*

Barbiturates: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Oral Contraceptive (Progestins) may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

CarBAMazepine: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Felbamate: May decrease the serum concentration of Oral Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Fosaprepitant: May decrease the serum concentration of Contraceptive (Progestins). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Griseofulvin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Herbs (Progestogenic Properties) (eg, Bloodroot, Yucca): May enhance the adverse/toxic effect of Progestins. *Risk C: Monitor therapy*

Mycophenolate: May decrease the serum concentration of Oral Contraceptive (Progestins). *Risk D: Consider therapy modification*

OXcarbazepine: May decrease the serum concentration of Oral Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Phenytoin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Retinoic Acid Derivatives: May diminish the therapeutic effect of Oral Contraceptive (Progestins). Two forms of contraception are recommended in females of child-bearing potential during retinoic acid derivative therapy. **Exceptions:** Adapalene; Alitretinoin; Tretinoin (Topical). *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Selegiline: Oral Contraceptive (Progestins) may increase the serum concentration of Selegiline. *Risk D: Consider therapy modification*

St Johns Wort: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Contraceptive (Progestins) may diminish the anticoagulant effect of Vitamin K Antagonists. In contrast, enhanced anticoagulant effects have also been noted with some products. *Risk D: Consider therapy modification*

Voriconazole: May decrease the metabolism of Oral Contraceptive (Progestins). Oral Contraceptive (Progestins) may increase the serum concentration of Voriconazole. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Herb/Nutraceutical: St John's wort (an enzyme inducer) may decrease serum levels of etonogestrel. Concomitant use is not recommended. Bloodroot, chasteberry, damiana, oregano, and yucca may enhance the adverse/toxic effect of progestins.

Test Interactions

Sex hormone-binding globulin: Serum concentrations may be decreased for first 6 months following implantation.

Thyroxine: Serum concentrations may be slightly decreased initially.

Monitoring Parameters Before starting therapy, a physical exam with reference to the breasts and pelvis are recommended, including a Papanicolaou smear. Exam may be deferred if appropriate; pregnancy should be ruled out prior to use. Monitor patient closely for loss of vision, sudden onset of proptosis, diplopia, migraine; blood pressure; signs and symptoms of thromboembolic disorders; signs or symptoms of depression; glycemic control in patients with diabetes; lipid profiles in patients being treated for hyperlipidemias. Adequate diagnostic measures, including endometrial sampling, if indicated, should be performed to rule out malignancy in all cases of undiagnosed abnormal vaginal bleeding.

Reference RangeEtonogestrel: A release rate of 25-30 mcg/day is required to inhibit ovulation

Nursing: Physical Assessment/MonitoringAssess insertion site. Monitor therapeutic response and adverse reactions at the beginning and periodically thoughout therapy. Assess knowledge/teach patient appropriate use, side effects, and symptoms to report.

Monitoring: Lab TestsBefore starting therapy, a Papanicolaou smear; pregnancy should be ruled out prior to use; monitor glycemic control in patients with diabetes; lipid profiles in patients being treated for hyperlipidemias

Patient EducationInform prescriber of all prescription medications, OTC medications, or herbal products you are taking. Do not take any new medications without consulting prescriber. Does not protect against HIV or other sexually transmitted diseases. Regular (as directed by prescriber) gynecological and regular self-breast exams are important. Changes in menstrual periods may occur (change in frequency, length, or spotting between periods). Use of a backup method of birth control (ie, condom) is recommended for 7 days after insertion. Periodically check for the presence of the device. If the device cannot be felt, use an alternative form of birth control until your prescriber confirms its presence. You will be given a user card to document the insertion of the device. Keep with your health records and keep track of the removal date. You may experience acne, breast pain, weight gain, vaginal discharge, back pain, dizziness (use caution when driving or engaging in tasks requiring alertness until response to drug is known), or nausea (small, frequent meals, frequent oral care, sucking lozenges, or chewing gum may help). Report excessive vaginal bleeding, depression or severe mood swings, persistent or severe headaches, chest pain, coughing up blood, shortness of breath, pain in legs, or abdominal pain. **Pregnancy/breast-feeding precautions:** Inform prescriber if you become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Rod, subdermal:

Implanon™: 68 mg [latex free]

Generic AvailableNo

ManufacturerOrganon

Mechanism of ActionEtonogestrel is the active metabolite of desogestrel. It prevents pregnancy by suppressing ovulation, increasing the viscosity of cervical mucous, and inhibiting endometrial proliferation.

Pharmacodynamics/Kinetics

Onset of action: Serum levels sufficient to inhibit ovulation: ≤8 hours of implant

Duration: Implant: Each rod maintains etonogestrel levels sufficient to inhibit ovulation for 3 years

Distribution: V_d: 201 L

Protein binding: Albumin (66%) and sex hormone-binding globulin (32%)

Metabolism: Hepatic via CYP3A4; forms metabolites (activity not known)

Bioavailability: Implant: 100%

Half-life, elimination: 25 hours

Excretion: Urine (primarily); feces

Pharmacotherapy PearlsFor subdermal insertion by healthcare providers trained on the insertion and removal procedure. For use in women who request long-acting (up to 3 years) contraception. A User Card (to give to the patient), consent form (to keep on file), and a medication guide (for the patient) are provided with the device.

The rod releases etonogestrel at a rate of 60-70 mcg/day, decreasing to 35-45 mcg/day after the first year, 30-40 mcg/day after the second year, and 25-30 mcg/day at the end of the third year. Following removal of rod, levels decrease rapidly and are less than the level of detection within 1 week.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Until more is known about the mechanism of interaction, use caution in prescribing antibiotics to female patients taking progestin-only contraceptives.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusHeadache is common; may cause dizziness, depression, nervousness, or mood lability

Mental Health: Effects on Psychiatric TreatmentEtonogestrel is not recommended for patients receiving potent enzyme inducers (eg, phenobarbital, carbamazepine, St John's wort). Weight gain is common; concomitant use with psychotropics may produce additive effects.

Index Terms3-Keto-desogestrel; ENG

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Etoposide may be confused with teniposide

Etoposide phosphate is a prodrug of etoposide and is rapidly converted in the plasma to etoposide. To avoid confusion or dosing errors, **dosage should be expressed as the desired etoposide dose,** not as the etoposide phosphate dose (eg, etoposide phosphate equivalent to ____ mg etoposide).

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(e toe POE side FOS fate)

U.S. Brand NamesEtopophos®

Pharmacologic CategoryAntineoplastic Agent, Podophyllotoxin Derivative

Use: Labeled IndicationsTreatment of refractory testicular tumors; treatment of small cell lung cancer

Dosing: AdultsRefer to individual protocols. **Note:** Etoposide phosphate is a prodrug of etoposide, doses should be expressed as the desired **ETOPOSIDE** dose; **not** as the etoposide phosphate dose. (eg, etoposide phosphate equivalent to ____ mg etoposide).

Small cell lung cancer: I.V. (in combination with other approved chemotherapeutic drugs): Etoposide 35 mg/m^2/day for 4 days to 50 mg/m^2/day for 5 days. Courses are repeated at 3- to 4-week intervals after adequate recovery from any toxicity.

Testicular cancer: I.V. (in combination with other approved chemotherapeutic agents): Etoposide 50-100 mg/m^2/day on days 1-5 to 100 mg/m^2/day on days 1, 3, and 5. Courses are repeated at 3- to 4-week intervals after adequate recovery from any toxicity.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Manufacturer recommended guidelines:

Cl$_{cr}$ 15-50 mL/minute: Administer 75% of normal dose

Cl$_{cr}$ <15 mL minute: Data are available; consider further dose reductions

Aronoff, 1999:

Cl$_{cr}$ 10-50 mL/minute: Administer 75% of normal dose

Cl$_{cr}$ <10 mL minute: Administer 50% of normal dose

Hemodialysis: Supplemental dose is not necessary

Peritoneal dialysis: Supplemental dose is not necessary

CAPD effects: Unknown

CAVH effects: Dose for Cl$_{cr}$ 10-50 mL/minute (Aronoff, 1999)

Dosing: Hepatic Impairment

Bilirubin 1.5-3 mg/dL or AST 60-180 units: Reduce dose by 50%.

Bilirubin 3-5 mg/dL or AST >180 units: Reduce dose by 75%.

Bilirubin >5 mg/dL: Do not administer.

Oncology: Bone Marrow - High DoseI.V.: 0.5-2 g/m^2 divided into 2 daily doses; maximum single-dose agent: 3.2 g/m^2; generally combined with other high-dose chemotherapeutic drugs.

Calculations

- Body Surface Area: Adults
- Creatinine Clearance: Adults

Administration: I.V.Infuse over 5-210 minutes.

Administration: I.V. Detail

BMT only: In contrast to etoposide, metabolic acidosis is not a frequent adverse effect of high-dose etoposide phosphate.

pH: 2.9 (reconstituted with sterile water for injection)

StorageStore intact vials of injection under refrigeration 2°C to 8°C (36°F to 46°F). Protect from light. Reconstituted etoposide phosphate is stable refrigerated at 2°C to 8°C (36°F to 47°F) for 7 days. Undiluted solutions are stable for 24 hours at room temperature of 20°C to 25°C (68°F to 77°F) when reconstituted with SWI, D_5W or NS; and stable for 48 hours at room temperature when reconstituted with bacteriostatic SWI or NS. Further diluted solutions are stable at room temperature 20°C to 25°C (68°F to 77°F) or under refrigeration 2°C to 8°C (36°F to 47°F) for up to 24 hours.

ReconstitutionReconstitute vials with 5 mL or 10 mL SWI, D_5W, NS, bacteriostatic SWI, or bacteriostatic NS to a concentration of 20 mg/mL or 10 mg/mL etoposide equivalent. These solutions may be administered without further dilution or may be diluted in 50-500 mL of D_5W or NS to a concentration as low as 0.1 mg/mL.

CompatibilityStable in D_5W, NS, sterile water for injection.

Y-site administration: Compatible: Acyclovir, amikacin, aminophylline, ampicillin, ampicillin/sulbactam, aztreonam, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, cefazolin, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, cimetidine, ciprofloxacin, cisplatin, clindamycin, co-trimoxazole, cyclophosphamide, cytarabine, dacarbazine, dactinomycin, daunorubicin, dexamethasone sodium phosphate, diphenhydramine, dobutamine, dopamine, doxorubicin, doxycycline, droperidol, enalaprilat, famotidine, floxuridine, fluconazole, fludarabine, fluorouracil, furosemide, ganciclovir, gatifloxacin, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hydrocortisone sodium phosphate, hydrocortisone sodium succinate, hydromorphone, hydroxyzine, idarubicin, ifosfamide, leucovorin, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, mesna, methotrexate, metoclopramide, metronidazole, minocycline, mitoxantrone, morphine, nalbuphine, netilmicin, ofloxacin, ondansetron, paclitaxel, piperacillin, piperacillin/tazobactam, plicamycin, potassium chloride, promethazine, ranitidine, sodium bicarbonate, streptozocin, teniposide, thiotepa, ticarcillin, ticarcillin/clavulanate, tobramycin, vancomycin, vinblastine, vincristine, zidovudine. **Incompatible:** Amphotericin B, cefepime, chlorpromazine, imipenem/cilastatin, methylprednisolone sodium succinate, mitomycin, prochlorperazine edisylate.

ContraindicationsHypersensitivity to etoposide, etoposide phosphate, or any component of the formulation; pregnancy

Warnings/Precautions

Boxed warnings:

- Bone marrow suppression: See "Concerns related to adverse effects" below.
- Experienced physician: See "Other warnings/precautions" below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Anaphylactic reaction: May cause anaphylactic reaction manifested by chills, fever, tachycardia, bronchospasm, dyspnea, and hypotension (higher concentrations were associated with higher rates of reactions in children). Infusion should be interrupted and medications for the treatment of anaphylaxis should be available for immediate use.
- Bone marrow suppression: **[U.S. Boxed Warning]: Severe myelosuppression with resulting infection or bleeding may occur.** Treatment should be withheld for platelets <50,000/mm^3 or absolute neutrophil count (ANC) <500/mm^3.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; dosage should be adjusted.
- Hypoalbuminemia: Use with caution in patients with low serum albumin; may increase risk for toxicities.
- Renal impairment: Use with caution in patients with renal impairment; dosage should be adjusted.

Special populations:

- Elderly: Use with caution in elderly patients; may be more likely to develop severe myelosuppression and/or GI effects.
- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Dosage: Doses of etoposide phosphate >175 mg/m^2 have not been evaluated.
- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**

Geriatric ConsiderationsElderly patients may be more susceptible to severe myelosuppression. Other adverse effects including GI toxicity, infectious complications, weakness, and alopecia may occur more frequently in elderly.

Pregnancy Risk FactorD

Pregnancy ConsiderationsAnimal studies have demonstrated teratogenicity and fetal loss. There are no adequate and well-controlled studies in pregnant women. Women of childbearing potential should be advised to avoid pregnancy.

LactationEnters breast milk/contraindicated

Adverse Reactions**Note:** Also see adverse reactions for **etoposide**. Since etoposide phosphate is converted to etoposide, adverse reactions experienced with etoposide would also be expected with etoposide phosphate.

>10%:

Central nervous system: Chills/fever (24%)

Dermatologic: Alopecia (33% to 44%)

Gastrointestinal: Nausea/vomiting (37%), anorexia (16%), mucositis (11%)

Hematologic: Leukopenia (91%; grade 4: 17%), neutropenia (88%; grade 4: 37%), anemia (72%; grades 3/4: 19%), thrombocytopenia (23%; grade 4: 9%)

Neuromuscular & skeletal: Weakness/malaise (39%)

1% to 10%:

Cardiovascular: Hypotension (5%), hypertension (3%), facial flushing (2%)

Central nervous system: Dizziness (5%)

Dermatologic: Skin rash (3%)

Gastrointestinal: Constipation (8%), abdominal pain (7%), diarrhea (6%), taste perversion (6%)

Local: Extravasation/phlebitis (5%)

Miscellaneous: Anaphylactic-type reactions (3%; including chills, diaphoresis, fever, rigor, tachycardia, bronchospasm, dyspnea, pruritus)

<1%, postmarketing, and/or case reports: Acute leukemia (with/without preleukemia phase), anaphylactic-like reactions, back pain, blindness (transient, cortical), cough, cyanosis, diaphoresis, dysphagia, erythema, facial swelling, hepatic toxicity, hyperpigmentation, hypersensitivity-associated apnea, infection, interstitial pneumonitis, laryngospasm, maculopapular rash, neutropenic fever, optic neuritis, perivasculitis, pruritus, pulmonary fibrosis, radiation recall dermatitis, seizure, Stevens-Johnson syndrome, taste perversion, tongue swelling, toxic epidermal necrolysis, urticaria

Oncology: VesicantNo
Oncology: Emetic PotentialMild (10% to 30%)
Oncology: Bone Marrow - Unique ToxicityGastrointestinal: Nausea, vomiting, mucositis
Metabolism/Transport Effects**Substrate** of CYP1A2 (minor), 2E1 (minor), 3A4 (major); **Inhibits** CYP2C9 (weak), 3A4 (weak)
Drug Interactions

Barbiturates: May decrease the serum concentration of Etoposide Phosphate. Barbiturates may increase the metabolism, via CYP isoenzymes, of etoposide phosphate. *Risk C: Monitor therapy*

CycloSPORINE: May increase the serum concentration of Etoposide Phosphate. CycloSPORINE may decrease the metabolism, via CYP isoenzymes, and decrease the p-glycoprotein-mediated elimination of Etoposide Phosphate. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phenytoin: May decrease the serum concentration of Etoposide Phosphate. Phenytoin may increase the metabolism, via CYP isoenzymes, of etoposide phosphate. *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase GI irritation).

Herb/Nutraceutical: Avoid St John's wort (may decrease etoposide levels).

Monitoring ParametersCBC with differential, platelet count, bilirubin, renal function

Nursing: Physical Assessment/MonitoringUse caution in presence of hepatic or renal impairment. Assess potential for interactions with other pharmacological agents or herbal products patient may be taking (potential for increasing/decreasing levels or effects of etoposide). See Reconstitution for specific directions. Assess results of laboratory tests and renal function, therapeutic effectiveness, and adverse response prior to each treatment and on a regular basis throughout therapy. Teach patient possible side effects/appropriate interventions and adverse symptoms to report (refer to Patient Education).

Monitoring: Lab TestsCBC with differential, platelet count, bilirubin, renal function

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication is administered by infusion. Report immediately any swelling, pain, burning, or redness at infusion site. Avoid alcohol. It is important to maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake, and adequate nutrition (small, frequent meals may help). You will be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). May cause nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); diarrhea (buttermilk, boiled milk, or yogurt may help); loss of hair (reversible); or mouth sores (use soft toothbrush or cotton swabs for oral care and rinse mouth frequently). Report immediately chest pain, swelling of extremities, respiratory difficulty, palpitations, or rapid heartbeat. Report extreme fatigue, pain or numbness in extremities, severe GI upset or diarrhea, bleeding or bruising, fever, chills, sore throat, vaginal discharge, respiratory difficulty, yellowing of eyes or skin, or changes in color of urine or stool. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication. Consult prescriber for appropriate barrier contraceptive measures to use during and for 1 month following therapy. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Etopophos®: 100 mg

Generic AvailableNo

Mechanism of ActionEtoposide phosphate is converted *in vivo* to the active moiety, etoposide, by dephosphorylation. Etoposide inhibits mitotic activity; inhibits cells from entering prophase; inhibits DNA synthesis. Initially thought to be mitotic inhibitors similar to podophyllotoxin, but actually have no effect on microtubule assembly. However, later shown to induce DNA strand breakage and inhibition of topoisomerase II (an enzyme which breaks and repairs DNA); etoposide acts in late S or early G2 phases.

Pharmacodynamics/Kinetics

Distribution: Average V_d: 7-17 L/m^2; poor penetration across blood-brain barrier; concentrations in CSF being <10% that of plasma

Protein binding: 94% to 97%

Metabolism:

Etoposide phosphate: Rapidly and completely converted to etoposide in plasma

Etoposide: Hepatic, via CYP3A4, to hydroxy acid and cislactone metabolites

Half-life elimination: Terminal: 4-11 hours; Children: Normal renal/hepatic function: 6-8 hours

Excretion: Urine (56%; 45% as etoposide); feces (44% as etoposide and metabolites)

Children: I.V.: Urine (≤55% as etoposide)

Related Information

- Safe Handling of Hazardous Drugs

Pharmacotherapy PearlsEtoposide phosphate 113.5 mg is equivalent to etoposide 100 mg. Dosages should always be expressed, and calculated, as the desired **etoposide** dose.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Mucositis (especially at high doses), stomatitis, and taste perversion.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause sedation

Mental Health: Effects on Psychiatric TreatmentMay cause myelosuppression; use caution with clozapine and carbamazepine

Oncology: Bone Marrow CommentsIn contrast to etoposide, metabolic acidosis is not a frequent adverse effect of high-dose etoposide phosphate. Etoposide 800 mg/m^2 was pharmacokinetically equivalent to etoposide phosphate 910 mg/m^2 in patients with refractory hematologic malignancies.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Etoposide may be confused with teniposide

VePesid速 may be confused with Versed

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(e toe POE side)

U.S. Brand NamesToposar速; VePesid速 [DSC]

Canadian Brand NamesVePesid速

Pharmacologic CategoryAntineoplastic Agent, Podophyllotoxin Derivative

Use: Labeled IndicationsTreatment of refractory testicular tumors; treatment of small cell lung cancer

Use: Unlabeled/InvestigationalTreatment of lymphomas, acute nonlymphocytic leukemia (ANLL); lung, bladder, and prostate carcinoma; hepatoma, rhabdomyosarcoma, uterine carcinoma, neuroblastoma, mycosis fungoides, Kaposi's sarcoma, histiocytosis, gestational trophoblastic disease, Ewing's sarcoma, Wilms' tumor, brain tumors

Dosing: AdultsRefer to individual protocols.

Small cell lung cancer (in combination with other approved chemotherapeutic drugs):

Oral: Due to poor bioavailability, oral doses should be twice the I.V. dose, rounded to the nearest 50 mg given once daily

I.V.: 35 mg/m^2/day for 4 days or 50 mg/m^2/day for 5 days every 3-4 weeks

IVPB: 60-100 mg/m^2/day for 3 days (with cisplatin)

CIV: 500 mg/m^2 over 24 hours every 3 weeks

Testicular cancer (in combination with other approved chemotherapeutic drugs):

IVPB: 50-100 mg/m^2/day for 5 days repeated every 3-4 weeks

I.V.: 100 mg/m^2 every other day for 3 doses repeated every 3-4 weeks

BMT/relapsed leukemia (unlabeled uses): I.V.: 2.4-3.5 g/m^2 or 25-70 mg/kg administered over 4-36 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to individual protocols.

Children (unlabeled uses): I.V.: 60-120 mg/m^2/day for 3-5 days every 3-6 weeks

AML: I.V.:

Remission induction: 150 mg/m^2/day for 2-3 days for 2-3 cycles

Intensification or consolidation: 250 mg/m^2/day for 3 days, courses 2-5

Brain tumor: I.V.: 150 mg/m^2/day on days 2 and 3 of treatment course

Neuroblastoma: I.V.: 100 mg/m^2/day over 1 hour on days 1-5 of cycle; repeat cycle every 4 weeks

BMT conditioning regimen used in patients with rhabdomyosarcoma or neuroblastoma: I.V. continuous infusion: 160 mg/m^2/day for 4 days

Conditioning regimen for allogenic BMT: I.V.: 60 mg/kg/dose as a single dose

Dosing: Renal Impairment

The FDA-approved labeling recommends the following adjustments:

Cl$_{cr}$ 15-50 mL/minute: Administer 75% of dose

- Cl_{cr} <15 mL minute: Data not available; consider further dose reductions

The following guidelines have been used by some clinicians:

- Aronoff, 2007:
  - Cl_{cr} 10-50 mL/minute: Children and Adults: Administer 75% of dose
  - Cl_{cr} <10 mL minute: Children and Adults: Administer 50% of dose
  - Hemodialysis:
    - Children: Administer 50% of dose
    - Adults: Supplemental dose is not necessary
  - Continuous ambulatory peritoneal dialysis (CAPD):
    - Children: Administer 50% of dose
    - Adults: Supplemental dose is not necessary
  - Continuous renal replacement therapy (CRRT): Children and Adults: Administer 75% of dose
- Kintzel, 1995:
  - Cl_{cr} 46-60 mL/minute: Administer 85% of dose
  - Cl_{cr} 31-45 mL/minute: Administer 80% of dose
  - Cl_{cr} <30 mL/minute: Administer 75% of dose

Dosing: Hepatic Impairment

The FDA-approved labeling does not contain dosing adjustment guidelines. The following adjustments have been used by some clinicians:

Donelli, 1998: Liver dysfunction may reduce the metabolism and increase the toxicity of etoposide. Normal doses of I.V. etoposide should be given to patients with liver dysfunction (dose reductions may result in subtherapeutic concentrations); however, use caution with concomitant liver dysfunction (severe) and renal dysfunction as the decreased metabolic clearance cannot be compensated by increased renal clearance.

Floyd, 2006: Bilirubin 1.5-3 mg/dL or AST >3 times ULN: Administer 50% of dose

King, 2001: Bilirubin 1.5-3 mg/dL or ALT or AST >180 units/L: Administer 50% of dose

Koren, 1992: Bilirubin 1.5-3 mg/dL or AST >180 units/L: Administer 50% of dose

Perry, 1982:

- Bilirubin 1.5-3 mg/dL or AST 60-180 units/L: Administer 50% of dose
- Bilirubin >3 mg/dL or AST >180 units/L: Avoid use

Oncology: Bone Marrow - High DoseI.V.: 750-2400 mg/m^2; 10-60 mg/kg; duration of infusion is 1-4 hours to 24 hours; generally combined with other high-dose chemotherapeutic drugs or total body irradiation (TBI).

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics
- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.M.Do not administer I.M. or SubQ (severe tissue necrosis).

Administration: I.V.Irritant. Administer lower doses IVPB over at least 30 minutes to minimize the risk of hypotensive reactions. Etoposide injection contains polysorbate 80 which may cause leaching of diethylhexyl phthalate (DEHP), a plasticizer contained in polyvinyl chloride (PVC) tubing. Administration through non-PVC (low sorbing) tubing will minimize patient exposure to DEHP.

Administration: I.V. DetailConcentrations >0.4 mg/mL are very unstable and may precipitate within a few minutes. For large doses, where dilution to ��.4 mg/mL is not feasible, consideration should be given to slow infusion of the undiluted drug through a running normal saline, dextrose or saline/dextrose infusion; or use of etoposide phosphate. Etoposide solutions of 0.1-0.4 mg/mL may be filtered through a 0.22 micron filter without damage to the filter or significant loss of drug.

pH: 3-4

BMT only: The etoposide formulation contains ethanol 30.3% (v/v). Etoposide 2.4 mg/m^2 delivers ethanol 45 g/m^2 I.V. Adverse effects may be increased with administration of etoposide to patients with decreased creatinine clearance.

Administration: OralDoses ��00 mg/day as a single once daily dose; doses >400 mg should be given in 2-4 divided doses. If necessary, the injection may be used for oral administration.

StorageStore intact vials of injection at 15属C to 30属C (59属F to 86属F). Protect from light. Store oral capsules at 2属C to 8属C (36属F to 46属F). Solutions for infusion, at room temperature, in D_5W or NS in polyvinyl chloride, the concentration is stable as follows:

0.2 mg/mL: 96 hours

0.4 mg/mL: 24 hours

Etoposide injection contains polysorbate 80 which may cause leaching of diethylhexyl phthalate (DEHP), a plasticizer contained in polyvinyl chloride (PVC) bags and tubing. Higher concentrations and longer storage time after preparation in PVC bags may increase DEHP leaching. Preparation in glass or polyolefin containers will minimize patient exposure to DEHP.

Etoposide injection diluted for oral use to 10 mg/mL in NS may be stored for 22 days in plastic oral syringes at room temperature. Mix with orange juice, apple juice, or lemonade to a concentration of ��.4 mg/mL, and use within a 3-hour period.

ReconstitutionEtoposide should be diluted to a concentration of 0.2-0.4 mg/mL in D_5W or NS for administration. Diluted solutions have concentration-dependent stability: More concentrated solutions have shorter stability times. Precipitation may occur with concentrations >0.4 mg/mL.

Compatibility**Variable stability (consult detailed reference)** in D_5W, LR, NS.

Y-site administration: Compatible: Allopurinol, amifostine, aztreonam, cladribine, doxorubicin liposome, fludarabine, gemcitabine, granisetron, melphalan, ondansetron, paclitaxel, piperacillin/tazobactam, sargramostim, sodium bicarbonate, teniposide, thiotepa, topotecan, vinorelbine. **Incompatible:** Cefepime, filgrastim, idarubicin.

Compatibility when admixed: Compatible: Carboplatin, cisplatin, cisplatin with cyclophosphamide, cisplatin with floxuridine, cytarabine, cytarabine with daunorubicin, floxuridine, fluorouracil, hydroxyzine, ifosfamide, ifosfamide with carboplatin, ifosfamide with cisplatin, ondansetron. **Variable (consult detailed reference):** Cisplatin with mannitol and potassium chloride, doxorubicin with vincristine.

ContraindicationsHypersensitivity to etoposide or any component of the formulation; pregnancy

Allergy Considerations

- Epidophyllotoxin Allergy

Warnings/Precautions

Boxed warnings:

��Bone marrow suppression: See ��oncerns related to adverse effects��below.

��Experienced physician: See ��ther warnings/precautions��below.

Special handling:

��Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

��Anaphylactic reaction: May cause anaphylactic reaction manifested by chills, fever, tachycardia, bronchospasm, dyspnea, and hypotension. In children, the use of concentrations higher than recommended were associated with higher rates of anaphylactic-like reactions. Infusion should be interrupted and medications for the treatment of anaphylaxis should be available for immediate use.

��Bone marrow suppression: **[U.S. Boxed Warning]: Severe myelosuppression with resulting infection or bleeding may occur.** Treatment should be withheld for platelets <50,000/mm^3 or absolute neutrophil count (ANC) <500/mm^3.

Disease-related concerns:

��Hepatic impairment: Use with caution in patients with hepatic impairment; dosage should be adjusted.

��Renal impairment: Use with caution in patients with renal impairment; dosage should be adjusted.

Dosage form specific issues:

��Benzyl alcohol: May contain benzyl alcohol which has been associated with "gasping syndrome" in neonates.

��Polysorbate 80: Injectable formula contains polysorbate 80; do not use in premature infants.

Other warnings/precautions:

��Administration: Must be diluted; do not give I.V. push, infuse over at least 30-60 minutes; hypotension is associated with rapid infusion.

��Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**

Pregnancy Risk FactorD

Pregnancy ConsiderationsAnimal studies have demonstrated teratogenicity and fetal loss. There are no adequate and well-controlled studies in pregnant women. Women of childbearing potential should be advised to avoid pregnancy.

LactationEnters breast milk/contraindicated

Adverse Reactions

>10%:

Dermatologic: Alopecia (8% to 66%)

Endocrine & metabolic: Ovarian failure (38%), amenorrhea

Gastrointestinal: Nausea/vomiting (31% to 43%), anorexia (10% to 13%), diarrhea (1% to 13%), mucositis/esophagitis (with high doses)

Hematologic: Leukopenia (60% to 91%; grade 4: 3% to 17%; onset: 5-7 days; nadir: 7-14 days; recovery: 21-28 days), thrombocytopenia (22% to

41%; grades 3/4: 1% to 20%; nadir 9-16 days), anemia (up to 33%)

1% to 10%:

Cardiovascular: Hypotension (1% to 2%; due to rapid infusion)

Gastrointestinal: Stomatitis (1% to 6%), abdominal pain (up to 2%)

Hepatic: Hepatic toxicity (up to 3%)

Neuromuscular & skeletal: Peripheral neuropathy (1% to 2%)

Miscellaneous: Anaphylactic-like reaction (I.V. infusion: 1% to 2%; including chills, fever, tachycardia, bronchospasm, dyspnea)

<1%: Anovulatory cycles, back pain; blindness (transient, cortical); CHF, constipation, cough, cyanosis, diaphoresis, dysphagia, erythema; extravasation (induration, necrosis, swelling); facial swelling, fatigue, fever, headache, hepatic toxicity, hepatitis, hyperpigmentation, hypersensitivity, hypersensitivity-associated apnea, hypomenorrhea, interstitial pneumonitis, laryngospasm, maculopapular rash, malaise, metabolic acidosis, MI, optic neuritis, perivasculitis, pruritus, pulmonary fibrosis, radiation-recall dermatitis, rash, seizure, somnolence, Stevens-Johnson syndrome, tachycardia, taste perversion, thrombophlebitis, tongue swelling, toxic epidermal necrolysis, urticaria, weakness

Oncology: Vesicant

No; irritant

Oncology: Emetic Potential

Low (10% to 30%)

Etoposide (oral): Moderate-to-high (30% to 90%)

Oncology: Bone Marrow - Unique Toxicity

Cardiovascular: Hypotension (infusion-related)

Central nervous system: Confusion, somnolence, seizure activity increased

Dermatologic: Skin lesions resembling Stevens-Johnson syndrome, alopecia

Endocrine & metabolic: Metabolic acidosis, parotitis

Gastrointestinal: Severe nausea and vomiting, mucositis

Hepatic: Hepatitis

Neuromuscular & skeletal: Peripheral neuropathy, motor deficits exacerbated

Miscellaneous: Secondary malignancy, ethanol intoxication (infusion-related)

Metabolism/Transport Effects

Substrate of CYP1A2 (minor), 2E1 (minor), 3A4 (major); **Inhibits** CYP2C9 (weak), 3A4 (weak)

Drug Interactions

Barbiturates: May increase the metabolism of Etoposide. *Risk C: Monitor therapy*

CycloSPORINE: May decrease the metabolism of Etoposide. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phenytoin: May increase the metabolism of Etoposide. *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vitamin K Antagonists (eg, warfarin): Antineoplastic Agents may enhance the anticoagulant effect of Vitamin K Antagonists. Antineoplastic Agents may diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Etoposide may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase GI irritation).

Herb/Nutraceutical: Avoid concurrent St John's wort; may decrease etoposide levels.

Monitoring ParametersCBC with differential, platelet count, and hemoglobin, vital signs (blood pressure), bilirubin, and renal function tests

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents or herbal products patient may be taking (eg, potential for increasing/decreasing levels or effects of etoposide). Patient should be monitored closely for anaphylactic reaction (chills, fever, tachycardia, bronchospasm, dyspnea, hypotension). Emergency equipment should be available. Assess results of laboratory tests and renal function, therapeutic effectiveness, and adverse response prior to each treatment and on a regular basis throughout therapy. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential, platelet count, bilirubin, renal function

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication may be administered by infusion. Report immediately any swelling, pain, burning, or redness at infusion site; swelling of extremities; palpitations, rapid heartbeat, sudden difficulty breathing or swallowing; chest pain or chills. It is important to maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake, and adequate nutrition (small, frequent meals may help). You will be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). May cause nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); diarrhea (buttermilk, boiled milk, or yogurt may help); loss of hair (reversible); or mouth sores (use soft toothbrush or cotton swabs for oral care and rinse mouth frequently). Report extreme fatigue, pain or numbness in extremities, severe GI upset or diarrhea, bleeding or bruising, fever, sore throat, vaginal discharge, yellowing of eyes or skin, or any changes in color of urine or stool. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication. Consult prescriber for appropriate contraceptive measures to use during and for 1 month following therapy. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule, softgel: 50 mg

VePesid速: 50 mg [DSC]

Injection, solution: 20 mg/mL (5 mL, 25 mL, 50 mL)

Toposar速: 20 mg/mL (5 mL, 25 mL, 50 mL) [contains alcohol 33% and polysorbate 80]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Capsules (VePesid)

50 mg (20): $1088.98

Mechanism of ActionEtoposide has been shown to delay transit of cells through the S phase and arrest cells in late S or early G_2 phase. The drug may inhibit mitochondrial transport at the NADH dehydrogenase level or inhibit uptake of nucleosides into HeLa cells. It is a topoisomerase II inhibitor and appears to cause DNA strand breaks. Etoposide does not inhibit microtubular assembly.

Pharmacodynamics/Kinetics

Absorption: Oral: 25% to 75%; significant inter- and intrapatient variation

Distribution: Average V_d: 7-17 L/m^2; poor penetration across the blood-brain barrier; CSF concentrations <10% of plasma concentrations

Protein binding: 94% to 97%

Metabolism: Hepatic to hydroxy acid and cislactone metabolites

Bioavailability: Oral: ��0% (range 25% to 75%)

Half-life elimination: Terminal: 4-11 hours; Children: Normal renal/hepatic function: 6-8 hours

Time to peak, serum: Oral: 1-1.5 hours

Excretion:

Children: Urine (��5% as unchanged drug)

Adults: Urine (42% to 67%; 8% to 35% as unchanged drug) within 24 hours; feces (up to 44%)

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Mucositis (especially at high doses) and stomatitis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause sedation

Mental Health: Effects on Psychiatric TreatmentMay cause myelosuppression; use caution with clozapine and carbamazepine

Oncology: Bone Marrow CommentsThe etoposide formulation contains ethanol 30.3% (v/v). Etoposide 2.4 mg/m^2 delivers ethanol 45 g/m^2 I.V. Adverse effects may be increased with administration of etoposide to patients with decreased creatinine clearance. Etoposide 400-1600 mg/m^2 has been drawn into plastic syringes undiluted (20 mg/mL) for administration over 3-4 hours. Etoposide 800 mg/m^2 was pharmacokinetically equivalent to etoposide phosphate 910 mg/m^2 in patients with refractory hematologic malignancies.

Index TermsEpipodophyllotoxin; VP-16; VP-16-213

Etravirine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(et ra VIR een)
U.S. Brand NamesIntelence™
Canadian Brand NamesIntelence™
Pharmacologic CategoryAntiretroviral Agent, Reverse Transcriptase Inhibitor (Non-nucleoside)
Use: Labeled IndicationsTreatment of HIV-1 infection in combination with at least two additional antiretroviral agents in treatment-experienced patients exhibiting viral replication with documented non-nucleoside reverse transcriptase inhibitor (NNRTI) resistance
Dosing: AdultsTreatment of HIV-1 infection: Oral: 200 mg twice daily after meals
Dosing: Renal ImpairmentDue to minimal renal clearance, dose adjustment likely unnecessary in renal impairment.
Dosing: Hepatic ImpairmentNo adjustment required for mild-to-moderate (Child-Pugh class A/B) impairment; no data in severe impairment.
Administration: OralAdminister after meals. If unable to swallow tablets, may disperse tablets in glass of water; stir well prior to drinking (swallow completely) and rinse glass several times to ensure administration of complete dose.
Dietary ConsiderationsTake after meals. May disperse tablets in glass of water; stir well prior to drinking and rinse glass several times to ensure administration of complete dose.
StorageStore at USP controlled room temperature of 25°C (77°F).
ContraindicationsThere are no contraindications listed in the manufacturer's labeling.
Warnings/Precautions

Concerns related to adverse effects:

- Fat redistribution: May cause redistribution of fat (eg, buffalo hump, peripheral wasting with increased abdominal girth, cushingoid appearance).

- Immune reconstitution syndrome: Patients may develop immune reconstitution syndrome resulting in the occurrence of an inflammatory response to an indolent or residual opportunistic infection; further evaluation and treatment may be required.

- Rash: Severe and possibly life-threatening reactions, including Stevens-Johnson syndrome, hypersensitivity reactions and erythema multiforme have been rarely reported; discontinue if severe rash develops. Self-limiting (with continued therapy) mild-to-moderate rashes (higher incidence in women) were also observed in clinical trials, usually during second week of therapy initiation.

Concurrent drug therapy issues:

- High potential for interactions: Use with caution in patients taking major CYP3A4, 2C9, or 2C19 substrates (see Drug Interactions); consider alternative agents that avoid or lessen the potential for CYP-mediated interactions.

- Not recommended for use with: Other NNRTIs, unboosted protease inhibitors, high-dose ritonavir, tipranavir/ritonavir, fosamprenavir/ritonavir, atazanavir/ritonavir, enzyme-inducing anticonvulsants, clarithromycin, St John's wort, rifampin, or rifapentine.

Special populations:

- Appropriate use: Not for use in treatment-naive patients, or experienced patients without evidence of viral mutations conferring resistance to NNRTIs and PIs.

- Pediatrics: Safety and efficacy have not been established in pediatric patients.

Pregnancy Risk FactorB
Pregnancy ConsiderationsNo evidence of fetal toxicity has been noted in animal reproduction studies. However, there are no adequate and well-controlled studies in pregnant women, and use during pregnancy is not recommended unless other alternatives are not available. Health professionals are encouraged to contact the antiretroviral pregnancy registry to monitor outcomes of pregnant women exposed to antiretroviral medications (1-800-258-4263 or www.APRegistry.com).
LactationExcretion in breast milk unknown/contraindicated
Breast-Feeding ConsiderationsHIV-infected mothers are discouraged from breast-feeding to decrease potential transmission of HIV.
Adverse Reactions

>10%:

Dermatologic: Rash (17%; ≥ grade 2: 9%)

Endocrine & metabolic: Cholesterol (total) increased (≤300 mg/dL: 18%; >300 mg/dL: 6%); hyperglycemia (≤250 mg/dL: 13%; 251-500 mg/dL: 3%), LDL increased (≤190 mg/dL: 12%)

Gastrointestinal: Nausea (14%; ≥ grade 2: 5%)

2% to 10%:

Cardiovascular: Hypertension (3%)

Endocrine & metabolic: Triglycerides increased (≤750 mg/dL: 7%; >750 mg/dL: 3% to 4%)

Gastrointestinal: Abdominal pain (3%), vomiting (≥ grade 2: 2%)

Hepatic: ALT increased (≤5 x ULN: 5%; >5 x ULN: 2%)

Neuromuscular & skeletal: Peripheral neuropathy (3%)

Renal: Creatinine increased (≤1.8 x ULN: 5%; >1.8 x ULN: 2%)

<2% (Limited to important or life-threatening): Amnesia, anemia (including hemolytic), angina, angioedema, anorexia, atrial fibrillation, bronchospasm, confusion, constipation, diabetes mellitus, dyspnea, erythema multiforme, gastritis, gynecomastia, haemorrhagic stroke, hematemesis, hepatic steatosis, hepatitis, hepatomegaly, hypersensitivity reaction, hypersomnia, hypoesthesia, immune reconstitution syndrome, insomnia, lipohypertrophy/dystrophy, MI, pancreatitis, paresthesia, renal failure, seizure, Stevens-Johnson syndrome, stomatitis, syncope, vertigo

Metabolism/Transport Effects **Substrate** of CYP3A4, 2C9, 2C19; **Inhibits** CYP2C9, 2C19; **Induces** CYP3A4

Drug Interactions

Atazanavir: May increase the serum concentration of Etravirine. Etravirine may decrease the serum concentration of Atazanavir. *Risk X: Avoid combination*

CarBAMazepine: May decrease the serum concentration of Etravirine. Management: The manufacturer of etravirine states these drugs should not be used in combination. *Risk X: Avoid combination*

CYP2C19 Inducers (Strong): May increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Substrates: CYP2C19 Inhibitors (Moderate) may decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C9 Inducers (Highly Effective): May increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Moderate) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Eplerenone: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Eplerenone. Management: A lower starting dose of eplerenone (25 mg once daily) is recommended in patients with hypertension who are also taking drugs that are moderate inhibitors of CYP3A4. *Risk D: Consider therapy modification*

FentaNYL: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Fosamprenavir: Etravirine may increase the serum concentration of Fosamprenavir. *Risk X: Avoid combination*

HMG-CoA Reductase Inhibitors: Etravirine may decrease the serum concentration of HMG-CoA Reductase Inhibitors. This applies to atorvastatin, lovastatin and simvastatin. Conversely, levels of fluvastatin may be increased. Management: Dose adjustment of the HMG-CoA reductase inhibitor may be warranted. No interaction is expected with rosuvastatin or pravastatin. **Exceptions:** Pravastatin; Rosuvastatin. *Risk C: Monitor therapy*

Macrolide Antibiotics: Etravirine may decrease the serum concentration of Macrolide Antibiotics. Clarithromycin AUC is reduced and levels of the active metabolite (14-hydroxy-clarithromycin) are modestly increased. Management: For the treatment of *Mycobacterium avium* complex, consider changing to alternative agent, such as azithromycin. **Exceptions:** Azithromycin. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Methadone: Etravirine may decrease the serum concentration of Methadone. *Risk C: Monitor therapy*

PHENobarbital: May decrease the serum concentration of Etravirine. Management: The manufacturer of etravirine states these drugs should not be used in combination *Risk X: Avoid combination*

Phenytoin: May decrease the serum concentration of Etravirine. Management: The manufacturer of etravirine states these drugs should not be used in combination *Risk X: Avoid combination*

Phosphodiesterase 5 Inhibitors: Etravirine may decrease the serum concentration of Phosphodiesterase 5 Inhibitors. Management: No empiric dosage adjustments are recommended with concomitant therapy; however, dose of the phosphodiesterase inhibitor may need to be altered based on clinical response. *Risk C: Monitor therapy*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the serum concentration of Etravirine. This effect is anticipated with darunavir & saquinavir (with low-dose ritonavir). Etravirine may increase the serum concentration of Protease Inhibitors. This effect is anticipated with nelfinavir. Protease Inhibitors may increase the serum concentration of Etravirine. This is expected with lopinavir/ritonavir. Management: Low-dose ritonavir boosting MUST be used when these protease inhibitors are used with etravirine. **Exceptions:** Amprenavir; Atazanavir; Fosamprenavir; Ritonavir; Tipranavir. *Risk C: Monitor therapy*

Ranolazine: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Ranolazine. Management: Limit the ranolazine dose to a maximum of 500mg twice daily in patients concurrently receiving moderate CYP3A4 inhibitors (e.g., diltiazem, verapamil, erythromycin, etc.). *Risk D: Consider therapy modification*

Reverse Transcriptase Inhibitors (Non-Nucleoside): May decrease the serum concentration of Etravirine. This has been observed with the NNRTIs efavirenz and nevirapine. Reverse Transcriptase Inhibitors (Non-Nucleoside) may increase the serum concentration of Etravirine. This has been observed with delavirdine. *Risk X: Avoid combination*

Rifabutin: May decrease the serum concentration of Etravirine. Management: Avoid concomitant use with rifabutin if a protease inhibitor/ritonavir combination is also used. *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Etravirine. **Exceptions:** Rifabutin. *Risk X: Avoid combination*

Ritonavir: May decrease the serum concentration of Etravirine. *Risk X: Avoid combination*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Tipranavir: May decrease the serum concentration of Etravirine. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Food: Increases absorption of etravirine by ~50%.

Herb/Nutraceutical: St John's wort (*Hypericum perforatum*) may decrease the levels/effects of etravirine; do not coadminister.

Monitoring ParametersCholesterol, triglycerides, serum glucose; signs of skin rash, signs and symptoms of infection

Nursing: Physical Assessment/MonitoringAssess other pharmacological or herbal products patient may be taking for potential interactions or toxicity; changing drugs or dosing adjustments may be necessary. Assess effectiveness of therapy (decrease in infections and progress of disease; viral load and CD4 count) and adverse reactions (eg, skin rash, may be severe and require discontinuing drug) periodically during therapy. Teach patient proper use (eg, timing of multiple medications and drugs that should not be used concurrently), possible side effects/appropriate interventions, and adverse symptoms to report (eg, rash, gastrointestinal upset).

Monitoring: Lab TestsCholesterol, triglycerides, serum glucose

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber. This drug will not cure HIV, nor has it been found to reduce transmission of HIV; use appropriate precautions to prevent spread to other persons. This drug is prescribed as one part of a multi-drug combination; take exactly as directed for full course of therapy. Take after meals. May disperse tablets in glass of water if unable to swallow whole; stir well prior to drinking, then rinse glass several times and swallow each rinse to ensure total dose administered. Maintain adequate hydration (2-3 L/day of fluids) unless advised by prescriber to restrict fluids. You may be susceptible to infection (avoid crowds and exposure to known infections and do not have any vaccinations without consulting prescriber). Frequent blood tests may be required with prolonged therapy. You may experience nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help; consult prescriber if nausea or vomiting persists) or changes in body fat (increased in upper back and neck and around trunk; decreased from extremities and face). Report immediately any sign of skin rash or irritation. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Intelence™: 100 mg

Generic AvailableNo

ManufacturerJanssen Cilag S.p.A., Latina, IT

Pricing: U.S. (www.drugstore.com)

Tablets (Intelence)

100 mg (120): $739.92

Mechanism of ActionAs a non-nucleoside reverse transcriptase inhibitor, etravirine has activity against HIV-1 by binding to reverse transcriptase. It consequently blocks the RNA-dependent and DNA-dependent DNA polymerase activities, including HIV-1 replication. It does not require intracellular phosphorylation for antiviral activity.

Pharmacodynamics/Kinetics

Absorption: Increased 50% with food

Protein binding: 99.9%

Metabolism: Hepatic, primarily by CYP3A4, 2C9, and 2C19; major metabolites exhibit ~10% of parent drug activity against HIV

Half-life elimination: 41 hours (± 20 hours)

Time to peak, plasma: 2.5-4 hours

Excretion: Feces (94%, up to 86% as unchanged drug); urine (1%)

Related Information

- Antiretroviral Agents
- Antiretroviral Therapy for HIV Infection: Adults and Adolescents

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Stomatitis has been reported.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay rarely cause amnesia, confusion, insomnia, and hypersomnia

Mental Health: Effects on Psychiatric TreatmentEtravirine is associated with Stevens-Johnson syndrome; monitor patients also receiving lamotrigine. May cause elevations in lipid panel; concomitant use with atypical antipsychotics may produce additive effects. GI side effects are common; concomitant use with lithium, SSRIs, valproic acid, and carbamazepine may produce additive effects. Associated with a high potential for drug-drug interactions; monitor. Carbamazepine, phenobarbital, and St John's wort may decrease the levels/effects of etravirine; do not coadminister. Etravirine may increase the levels/effects of citalopram, diazepam, fluoxetine, propranolol, and sertraline. Etravirine may decrease the levels/effects of benzodiazepines, methadone, mirtazapine, nefazodone, and venlafaxine.

Exemestane

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Exemestane may be confused with estramustine.

Pronunciation(ex e MES tane)
U.S. Brand NamesAromasin®
Canadian Brand NamesAromasin®
Pharmacologic CategoryAntineoplastic Agent, Aromatase Inactivator
Use: Labeled IndicationsTreatment of advanced breast cancer in postmenopausal women whose disease has progressed following tamoxifen therapy; adjuvant treatment of postmenopausal estrogen receptor-positive early breast cancer following 2-3 years of tamoxifen (for a total of 5 years of adjuvant therapy)
Dosing: AdultsBreast cancer: Oral: 25 mg once daily

Dosage adjustment with CYP3A4 inducers: 50 mg once daily when used with potent inducers (eg, rifampin, phenytoin)

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentSafety of chronic dosing in renal impairment has not been established.
Dosing: Hepatic ImpairmentSafety of chronic dosing in hepatic impairment has not been established.
Administration: OralAdminister after a meal.
Dietary ConsiderationsTake after a meal; patients on aromatase inhibitor therapy should receive vitamin D and calcium supplements.
StorageStore at 25°C (77°F)
ContraindicationsHypersensitivity to exemestane or any component of the formulation; pregnancy
Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concurrent drug therapy issues:

- Estrogen-containing drugs: Should not be administered concurrently with estrogen-containing drugs.

Special populations:

- Premenopausal women: Not recommended for use in premenopausal women.

Geriatric ConsiderationsIn pharmacokinetic trials, no significant changes were seen in women <68 years of age.
Pregnancy Risk FactorD
Pregnancy ConsiderationsExemestane has been associated with prolonged gestation, abnormal or difficult labor, increased resorption, reduced number of live fetuses, decreased fetal weight, and retarded ossification in rats. It is not indicated for premenopausal women, but if exposure occurred during pregnancy, risk to the fetus and potential risk for loss of the pregnancy should be discussed.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions

>10%:

Cardiovascular: Hypertension (5% to 15%)

Central nervous system: Fatigue (8% to 22%), insomnia (11% to 14%), pain (13%), headache (7% to 13%), depression (6% to 13%)

Dermatological: Hyperhidrosis (4% to 18%), alopecia (15%)

Endocrine & metabolic: Hot flashes (13% to 21%)

Gastrointestinal: Nausea (9% to 18%), abdominal pain (6% to 11%)

Hepatic: Alkaline phosphatase increased (14% to 15%)

Neuromuscular & skeletal: Arthralgia (15% to 29%)

1% to 10%:

Cardiovascular: Edema (6% to 7%); cardiac ischemic events (2%: MI, angina, myocardial ischemia); chest pain

Central nervous system: Dizziness (8% to 10%), anxiety (4% to 10%), fever (5%), confusion, hypoesthesia

Dermatologic: Dermatitis (8%), itching, rash

Endocrine & metabolic: Weight gain (8%)

Gastrointestinal: Diarrhea (4% to 10%), vomiting (7%), anorexia (6%), constipation (5%), appetite increased (3%), dyspepsia

Genitourinary: Urinary tract infection

Hepatic: Bilirubin increased (5% to 7%)

Neuromuscular & skeletal: Back pain (9%), limb pain (9%), osteoarthritis (6%), weakness (6%), osteoporosis (5%), pathological fracture (4%), paresthesia (3%), carpal tunnel syndrome (2%), cramps (2%)

Ocular: Visual disturbances (5%)

Renal: Creatinine increased (6%)

Respiratory: Dyspnea (10%), cough (6%), bronchitis, pharyngitis, rhinitis, sinusitis, upper respiratory infection

Miscellaneous: Influenza-like symptoms (6%), diaphoresis (6%), lymphedema, infection

<1%: Cardiac failure, endometrial hyperplasia, GGT increased, neuropathy, osteochondrosis, thromboembolism, transaminases increased, trigger finger, uterine polyps

A dose-dependent decrease in sex hormone-binding globulin has been observed with daily doses of 25 mg or more. Serum luteinizing hormone and follicle-stimulating hormone levels have increased with this medicine.

Oncology: Emetic PotentialLow (10% to 30%)
Metabolism/Transport Effects**Substrate** of CYP3A4 (major)
Drug Interactions

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Rifampin: May increase the metabolism of Exemestane. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Food: Plasma levels increased by 40% when exemestane was taken with a fatty meal.

Herb/Nutraceutical: St John's wort may decrease exemestane levels. Avoid black cohosh, dong quai in estrogen-dependent tumors.

Nursing: Physical Assessment/MonitoringNot indicated for women who are premenopausal or those taking any estrogen containing products. Assess patient response prior to each treatment and on a regular basis throughout therapy. Teach patient proper use, possible side effects/appropriate interventions (eg, importance of adequate hydration), and adverse symptoms to report.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take after meals at approximately the same time each day; may cause indigestion (small, frequent meals, and frequent mouth care may reduce GI upset). You may be more susceptible to infection (avoid crowds or exposure to infection and do not have any vaccinations unless approved by prescriber). May cause headache, dizziness, confusion, fatigue, anxiety, insomnia (use caution when driving or engaging in tasks requiring alertness until response to medication is known); nausea, vomiting, loss of appetite (small, frequent meals, good mouth care, chewing gum, or sucking hard candy may help); or hot flashes (cool dark room or cold compresses may help). Report chest pain, palpitations; acute headache, visual disturbances; unresolved GI problems; itching or burning on urination, vaginal discharge; acute joint, back, bone, or muscle pain; respiratory difficulty, unusual cough, respiratory infection; or other adverse response. **For use in postmenopausal women only.**

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 25 mg

Generic AvailableNo
Pricing: U.S. (www.drugstore.com)

Tablets (Aromasin)

25 mg (30): $310.27

Mechanism of ActionExemestane is an irreversible, steroidal aromatase inactivator. It prevents conversion of androgens to estrogens by tying up the enzyme aromatase. In breast cancers where growth is estrogen-dependent, this medicine will lower circulating estrogens.
Pharmacodynamics/Kinetics

Absorption: Rapid and moderate (~42%) following oral administration; absorption increases ~40% following high-fat meal

Distribution: Extensive

Protein binding: 90%, primarily to albumin and α_1-acid glycoprotein

Metabolism: Extensively hepatic; oxidation (CYP3A4) of methylene group, reduction of 17-keto group with formation of many secondary metabolites; metabolites are inactive

Half-life elimination: 24 hours

Time to peak: Women with breast cancer: 1.2 hours

Excretion: Urine (<1% as unchanged drug, 39% to 45% as metabolites); feces (36% to 48%)

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status Drowsiness, depression, insomnia, and anxiety are common; may cause confusion

Mental Health: Effects on Psychiatric Treatment None reported

Exenatide

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Special Alerts

Exenatide (Byetta®): Hemorrhagic or Necrotizing Pancreatitis - August 2008

The Food and Drug Administration (FDA) has issued an update regarding the incidence of pancreatitis associated with the use of exenatide (Byetta®). In addition to previously reported postmarketing cases of acute pancreatitis, the FDA has received six case reports (including two fatalities) of hemorrhagic or necrotizing pancreatitis in patients receiving exenatide therapy. As a result, the FDA is working with the manufacturer of exenatide, Amylin Pharmaceuticals, to update the prescribing information to strengthen warnings concerning the risk for acute hemorrhagic or necrotizing pancreatitis.

In addition, the FDA is reminding healthcare professionals that exenatide therapy should be promptly discontinued in patients in whom pancreatitis is suspected. If pancreatitis is confirmed, administer appropriate treatment as indicated and do not restart exenatide therapy. Alternative antidiabetic therapy should be considered in patients with a prior history of pancreatitis.

Additional information can be found at http://www.fda.gov/cder/drug/InfoSheets/HCP/exenatide2008HCP.htm

Pronunciation(ex EN a tide)

U.S. Brand NamesByetta®

Pharmacologic CategoryAntidiabetic Agent, Incretin Mimetic

Use: Labeled IndicationsManagement (adjunctive) of type 2 diabetes mellitus (noninsulin dependent, NIDDM) in patients receiving a sulfonylurea, thiazolidinedione, or metformin (or a combination of these agents)

Dosing: Adults**Adjunctive therapy of type 2 diabetes:** SubQ: Initial: 5 mcg twice daily within 60 minutes prior to a meal; after 1 month, may be increased to 10 mcg twice daily (based on response)

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} ≥30 mL/minute: No adjustment necessary.

Cl_{cr} <30 mL/minute: Not recommended

Calculations

- Creatinine Clearance: Adults

Administration: OtherShould be administered subcutaneously in the upper arm, thigh, or abdomen. Administer within 60 minutes prior to morning and evening meal (or prior to the 2 main meals of the day, approximately ≥6 hours apart). Set up each new pen before the first use by priming it. See pen user manual for further details. Dial the dose into the dose window before each administration.

StoragePrior to initial use, store under refrigeration at 2°C to 8°C (36°F to 46°F); after initial use, may be stored at a temperature ≤25° (≤77°F). Do not freeze (discard if freezing occurs). Protect from light. Pen should be discarded 30 days after initial use.

ContraindicationsHypersensitivity to exenatide or any component of the formulation; type 1 diabetes; diabetic ketoacidosis

Warnings/Precautions

Concerns related to adverse effects:

- Anti-exenatide antibodies: Use may be associated with the development of anti-exenatide antibodies; low titers are not associated with a loss of efficacy, however high titers (observed in 6% of patients in clinical studies) may result in an attenuation of response.
- GI symptoms: Most common reactions are gastrointestinal related; these symptoms may be dose-related and may decrease in frequency/severity with gradual titration and continued use.
- Pancreatitis: Cases of acute pancreatitis (including hemorrhagic and necrotizing with some fatalities) have been reported; monitor for unexplained severe abdominal pain, and if pancreatitis is suspected, discontinue use. Do not resume unless an alternative etiology of pancreatitis is confirmed. Consider alternative antidiabetic therapy in patients with a history of pancreatitis.
- Weight loss: Use may be associated with weight loss (due to reduced intake) independent of the change in hemoglobin A_{1c}.

Disease-related concerns:

- Diabetes, type 1: Mechanism requires the presence of insulin, therefore use in type 1 diabetes (insulin dependent, IDDM) or diabetic ketoacidosis is not recommended; it is not a substitute for insulin in insulin-requiring patients.
- Gastrointestinal disease: Not recommended to be used in patients with gastroparesis or severe gastrointestinal disease; due to frequent gastrointestinal adverse effects.

- Renal impairment: Use not recommended in severe renal impairment (Cl_{cr} <30 mL/minute).

Concurrent drug therapy issues:

- Insulin/other hypoglycemic agents: Concurrent use with other hypoglycemic agents and/or insulin therapy has not been evaluated.
- Sulfonylureas: In combination with a sulfonylurea, may increase the risk of hypoglycemia (risk not increased when added to metformin monotherapy); this risk is related to the dosage of both exenatide and the sulfonylurea.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsIntensive glucose control (Hb A_{1c} <6.5) has been linked to increased all cause and cardiovascular mortality, hypoglycemia requiring assistance, and weight gain in adult type 2 diabetes. For elderly patients with diabetes who are relatively healthy, attaining target goals for aspirin use, blood pressure, lipids, smoking cessation, and diet and exercise may be more important than normalized glycemic control.

Pregnancy Risk FactorC

Pregnancy ConsiderationsDue to adverse events observed in some animal studies, exenatide is classified as pregnancy category C. Based on *in vitro* data, exenatide has a low potential to cross the placenta. Maternal hyperglycemia can be associated with adverse effects in the fetus, including macrosomia, neonatal hyperglycemia, and hyperbilirubinemia; the risk of congenital malformations is increased when the Hb A_{1c} is above the normal range. Diabetes can also be associated with adverse effects in the mother. Poorly-treated diabetes may cause end-organ damage that may in turn negatively affect obstetric outcomes. Physiologic glucose levels should be maintained prior to and during pregnancy to decrease the risk of adverse events in the mother and the fetus. Until additional safety and efficacy data are obtained, the use of exenatide is generally not recommended in the routine management of diabetes mellitus during pregnancy. Insulin is the drug of choice for the control of diabetes mellitus during pregnancy. A registry has been established for women exposed to exenatide during pregnancy (1-800-633-9081).

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsIt is not known if exenatide is present in breast milk. The manufacturer recommends that caution be exercised when administering exenatide to nursing women.

Pregnancy & Lactation, In-Depth

- Exenatide in Pregnancy & Lactation

Adverse Reactions

>10%:

Endocrine & metabolic: Hypoglycemia (with concurrent sulfonylurea therapy 14% to 36%; frequency similar to placebo with metformin therapy)

Gastrointestinal: Nausea (44%), vomiting (13%), diarrhea (13%)

Miscellaneous: Anti-exenatide antibodies (low titers 38%, high titers 6%)

1% to 10%:

Central nervous system: Dizziness (9%), headache (9%)

Endocrine & metabolic: Appetite decreased (<5%)

Gastrointestinal: Dyspepsia (6%), GERD (<5%)

Neuromuscular & skeletal: Weakness (<5%)

Miscellaneous: Feeling jittery (9%), diaphoresis increased (<5%)

Postmarketing and/or case reports: Abdominal distension, abdominal pain, acute pancreatitis (including hemorrhagic and necrotizing), anaphylactic reaction, angioedema, chest pain, constipation, dysgeusia, eructation, flatulence, hypersensitivity pneumonitis, injection site reaction, macular or papular rash, pruritus, renal failure, serum creatinine increased, somnolence, urticaria

Drug InteractionsThere are no known significant interactions.

Ethanol/Nutrition/Herb InteractionsEthanol: Caution with ethanol (may cause hypoglycemia)

Monitoring ParametersSerum glucose, hemoglobin A_{1c}, and renal function

Nursing: Physical Assessment/MonitoringAssess other prescription and OTC medications the patient may be taking to avoid duplications and interactions. Teach appropriate injection technique and disposal of needles. Assess knowledge/teach patient appropriate use, side effects, and symptoms to report.

Monitoring: Lab TestsSerum glucose, hemoglobin A_{1c}, and renal function

Patient EducationTake as directed. Administer injection within 60 minutes of meals. Do not administer after meal. Consume alcohol with caution; may cause hypoglycemia. It is important to follow dietary and lifestyle recommendations of prescriber. You may experience nausea (small, frequent meals, frequent oral care, sucking lozenges, or chewing gum may help), feeling jittery, dizziness, or lightheadedness (use caution when driving or engaging in activities requiring alertness until response to drug is known). Maintain adequate hydration (2-3 L/day) unless instructed to restrict intake by prescriber. Report persistent nausea, diarrhea, abdominal pain, or dizziness. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution:

Byetta®: 250 mcg/mL (1.2 mL [5 mcg/0.02 mL; 60-dose pen]); (2.4 mL [10 mcg/0.04 mL; 60-dose pen])

Generic AvailableNo
Pricing: U.S. (www.drugstore.com)

Solution (Byetta 10 MCG Pen)

10 mcg/0.04 mL (2.4): $229.97

Solution (Byetta 5 MCG Pen)

5 mcg/0.02 mL (1.2): $213.03

Mechanism of ActionExenatide is an analog of the hormone incretin (glucagon-like peptide 1 or GLP-1) which increases insulin secretion, increases B-cell growth/replication, slows gastric emptying, and may decrease food intake. When added to sulfonylureas, thiazolidinediones, and/or metformin, it results in additional lowering of hemoglobin A_{1c} by approximately 0.5% to 1%.
Pharmacodynamics/Kinetics

Distribution: V_d: 28.3 L

Metabolism: Minimal systemic metabolism; proteolytic degradation may occur following glomerular filtration

Half-life elimination: 2.4 hours

Time to peak, plasma: SubQ: 2.1 hours

Excretion: Urine (majority of dose)

Pharmacotherapy PearlsA dosing strategy which employs progressive dose escalation of exenatide (initiating at 0.02 mcg/kg 3 times daily and increasing in increments of 0.02 mcg/kg every 3 days) has been described, limiting the frequency and severity of gastrointestinal adverse effects. The complexity of this regimen may limit its clinical application.

In animal models, exenatide has been a useful adjunctive therapy when added to immunotherapy protocols, resulting in recovery of beta cell function and sustained remission.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause dizziness
Mental Health: Effects on Psychiatric Treatment

GI side effects are common; use caution with SSRIs, lithium, and valproic acid

Special Alerts

HMG-CoA Reductase Inhibitors: Evidence Does Not Suggest Increased Incidence of Amyotrophic Lateral Sclerosis (ALS) - Results of FDA Analysis - September 30, 2008

The U.S. Food and Drug Administration's (FDA) review of 41 long-term controlled clinical trials of HMG-CoA reductase inhibitors finds no evidence of an increased incidence of ALS (also known as Lou Gehrig's disease) related to these medications. This analysis occurred after the FDA had received notice of numerous adverse events of which 109 of these reports mentioned ALS, Lou Gehrig's disease, or motor neurone disease. The clinical trials included in the analysis had a median duration of treatment of 3.3 years (range of duration: 6 months to 5 years) and involved 120,964 patients. The analysis identified a total of 19 cases of ALS – 9 cases per 64,602 patients (0.014%) with statin therapy and 10 cases per 56,362 patients (0.017%) with placebo. The incidence rates, based on approximately 400,000 person-years, were 4.2 per 100,000 person-years in the statin-treated group and 5 per 100,000 person-years in the placebo-treated group.

The FDA recommends that health care providers continue to prescribe, and patients continue to use these products as described within their labeling.

For more information, healthcare professionals may refer to the following:

http://www.fda.gov/medwatch/safety/2008/safety08.htm#Statin

Colman E, Szarfman A, Wyeth J, et al, "An Evaluation of a Data Mining Signal for Amyotrophic Lateral Sclerosis and Statins Detected in FDA's Spontaneous Adverse Event Reporting System," *Pharmacoepidemiol Drug Saf*, 2008 (epub ahead of print)

Ezetimibe (Zetia®), Simvastatin (Zocor®), and Ezetimibe/Simvastatin (Vytorin®): Preliminary Results From the SEAS Trial - Updated September 2008

The U.S. Food and Drug Administration (FDA) has communicated important information regarding an ongoing safety review of the Simvastatin and Ezetimibe in Aortic Stenosis (SEAS) trial. The SEAS trial (Rossebo, 2008), recently available online, evaluated the effects of the combination ezetimibe/simvastatin (Vytorin®) on clinical outcomes in patients with mild-to-moderate asymptomatic aortic stenosis. The 5-year trial demonstrated that ezetimibe/simvastatin was no better than placebo in reducing the primary composite outcomes – major cardiovascular events (eg, death from cardiovascular causes, aortic-valve replacement, heart failure) or the composite outcome of aortic-valve-related clinical events and ischemia. Additionally, a higher incidence of newly diagnosed cancer of any type (105 patients taking ezetimibe/simvastatin vs 70 patients taking placebo, p=0.01) and cancer-related death (39 patients taking ezetimibe/simvastatin vs 23 patients taking placebo, p=0.05) was observed in the patients receiving ezetimibe/simvastatin compared to those receiving placebo. Of note, 8 patients diagnosed with cancer prior to randomization experienced recurrence (3 in the ezetimibe/simvastatin group vs 5 in the placebo group).

Subsequently, an interim analysis of the ongoing Study of Heart and Renal Protection (SHARP) trial and the Improved Reduction of Outcomes: Vytorin Efficacy International Trial (IMPROVE-IT) with a total of 20,617 randomized patients demonstrated no overall excess of cancer (313 active-treatment vs 326 control, p=0.61) (Peto, 2008). The SHARP trial randomized patients with chronic kidney disease to either ezetimibe/simvastatin or placebo. The IMPROVE-IT trial randomized patients with acute coronary syndrome to either ezetimibe/simvastatin or simvastatin alone. When the SEAS trial data is included in this analysis, there still is no significant excess of cancer (414 active-treatment vs 391 control, p=0.46). However, cancer-associated deaths were significantly higher when compared to controls (134 vs 92, respectively; p=0.007). Previous trials and meta-analyses involving the use of ezetimibe, simvastatin, or ezetimibe/simvastatin also have not shown an increased risk of cancer.

The FDA estimates that it will take approximately 6 months to fully evaluate the clinical trial data after receipt of the final SEAS trial report. At this time, the FDA recommends that patients continue taking their cholesterol-lowering medications.

For more information, U.S. healthcare professionals may refer to the following:

Simvastatin and Amiodarone Concurrent Therapy: Dose-Related Increased Risk of Rhabdomyolysis - August 2008

The U.S. Food and Drug Administration (FDA) has issued an alert to remind practitioners of a dose-related increased risk of rhabdomyolysis when amiodarone is used concurrently with simvastatin at doses >20 mg. If patients require simvastatin >20 mg, an alternative HMG-CoA reductase inhibitor (statin) should be used. This information has previously been incorporated into the Lexi-Comp monograph.

Additional information may be found at http://www.fda.gov/cder/drug/InfoSheets/HCP/simvastatin_amiodaroneHCP.htm

Ezetimibe/Simvastatin (Vytorin®), Ezetimibe (Zetia®), and Simvastatin (Zocor®): ENHANCE Results - January, 2008

The U.S. Food and Drug Administration (FDA) is communicating important information regarding the preliminary results of the Effect of Combination Ezetimibe and High-Dose Simvastatin vs. Simvastatin Alone on the Atherosclerotic Process in Patients with Heterozygous Familial Hypercholesterolemia (ENHANCE) trial, originally released on January 14, 2008, by Merck/Schering Plough. This multinational, randomized, double-blind trial was conducted in 720 patients with heterozygous familial hypercholesterolemia (HeFH) over a two-year period. Patients were randomized to either ezetimibe 10 mg/simvastatin 80 mg (Vytorin®) or simvastatin 80 mg alone (Zocor®). The primary endpoint of the trial was mean change in carotid intima-media thickness (CIMT) which is a surrogate endpoint believed to translate in a reduction of future cardiovascular events. It is important to note that this was an imaging trial and was not powered for clinical outcomes (eg, MI, stroke). Although ezetimibe/simvastatin lowered LDL cholesterol more effectively as compared to simvastatin alone, there was no difference seen in mean change in CIMT. Adverse events were similar between both groups.

Upon completion of full data analysis, the manufacturer will submit a final report to the FDA. Once the report is received, the FDA estimates it will take about 6 months to fully evaluate the data and decide whether or not further regulatory action is necessary. Three large clinical outcome trials evaluating the use of ezetimibe/simvastatin will be presented over the next 2-3 years.

At this point in time, patients should not stop taking their ezetimibe/simvastatin (Vytorin®), ezetimibe (Zetia®), or simvastatin (Zocor®). Instead patients should talk with their healthcare provider if they have questions about the ENHANCE trial.

For more information, U.S. healthcare professionals may refer to the following:

FDA: http://www.fda.gov/medwatch/safety/2008/safety08.htm#Ezetimibe

American College of Cardiology (ACC) Statement on ENHANCE Trial: http://www.acc.org/enhance.htm

Medication Safety Issues

Sound-alike/look-alike issues:

Vytorin® may be confused with Vyvanse™

Pronunciation(ez ET i mibe & SIM va stat in)

U.S. Brand NamesVytorin®

Pharmacologic CategoryAntilipemic Agent, 2-Azetidinone; Antilipemic Agent, HMG-CoA Reductase Inhibitor

Use: Labeled IndicationsUsed in combination with dietary modification for the treatment of primary hypercholesterolemia and homozygous familial hypercholesterolemia

Dosing: Adults

Homozygous familial hypercholesterolemia: Ezetimibe 10 mg and simvastatin 40 mg once daily or ezetimibe 10 mg and simvastatin 80 mg once daily in the evening. Dosing range: Ezetimibe 10 mg and simvastatin 10-80 mg once daily.

Hyperlipidemias: Oral: Initial: Ezetimibe 10 mg and simvastatin 20 mg once daily in the evening; those patients requiring less aggressive LDL-C reductions can start with ezetimibe 10 mg and simvastatin 10 mg once daily

Patients who require less aggressive reduction in LDL-C: Initial: Ezetimibe 10 mg and simvastatin 10 mg once daily

Patients who require >55% reduction in LDL-C: Initial: Ezetimibe 10 mg and simvastatin 40 mg once daily

Dosage adjustment with concomitant medications: Oral:

Amiodarone or verapamil: Dose should not exceed ezetimibe 10 mg and simvastatin 20 mg once daily.

Danazol or cyclosporine: Patient must first demonstrate tolerance to simvastatin ≥5 mg once daily. Dose should not exceed ezetimibe 10 mg and simvastatin 10 mg once daily.

Gemfibrozil: Although concurrent use is not recommended by manufacturer, dose should not exceed ezetimibe 10 mg and simvastatin 10 mg once daily.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentDosage adjustment unnecessary in mild to moderate renal dysfunction. In severe dysfunction, start only if patient tolerates 5 mg daily of simvastatin; monitor closely.

Dosing: Hepatic ImpairmentDosage adjustment unnecessary in mild hepatic dysfunction.

Dietary ConsiderationsMay be taken with or without food. Red yeast rice contains an estimated 2.4 mg lovastatin per 600 mg of rice.

StorageStore at 20°C to 25°C (68°F to 77°F).

ContraindicationsHypersensitivity to ezetimibe, simvastatin, or any component of the formulation; acute liver disease; unexplained persistent elevations of serum transaminases; pregnancy; breast-feeding

Allergy Considerations

- HMG-CoA Reductase Inhibitor Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Myopathy/rhabdomyolysis: Patients receiving HMG-CoA reductase inhibitors have developed rhabdomyolysis with acute renal failure and/or myopathy; patients should be monitored closely. This risk is dose-related and is increased with concurrent use of other lipid lowering medications. Temporarily discontinue for elective major surgery, acute medical or surgical conditions, or in any patient experiencing an acute or serious condition predisposing to renal failure (eg, sepsis, hypotension, trauma, uncontrolled seizures). Based upon current evidence, HMG-CoA reductase inhibitor therapy should be continued in the perioperative period unless risk outweighs cardioprotective benefit. Use caution in patients with renal impairment, inadequately treated hypothyroidism, and those taking other drugs associated with myopathy (eg, colchicine); these patients are predisposed to myopathy. Patients should be instructed to report unexplained muscle pain, tenderness, weakness, or brown urine.

Disease-related concerns:

- Hepatic impairment: Use ezetimibe with caution in patients with mild hepatic impairment; not recommended for use with moderate or severe hepatic impairment. Use simvastatin with caution in patients who consume large amounts of ethanol or have a history of liver disease.

Concurrent drug therapy issues:

- High potential for interactions: Use simvastatin with caution in patients taking strong CYP3A4 inhibitors (see drug interactions); consider alternative agents that avoid or lessen potential for CYP-mediated interactions.

Special populations:

- Elderly: Use with caution in patients with advanced age, these patients are predisposed to myopathy.

- Pediatrics: Safety and efficacy have not been established in patients <10 years of age or premenarcheal girls.

Other warnings/precautions:

- Hyperlipidemia: Secondary causes of hyperlipidemia should be ruled out prior to therapy.

- Liver function tests: Must be monitored by periodic laboratory assessment.

Geriatric ConsiderationsClinical studies of Vytorin® included a total of 792 patients >65 years of age with 176 of these patients ≥75 years. The safety in this group was similar to the younger patients. No adjustment of dose is necessary for initiation of treatment in the elderly.

Pregnancy Risk FactorX

Pregnancy ConsiderationsSee individual agents.

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsSee individual agents.

Adverse ReactionsPercentages below refer to combination Vytorin®. Also see individual agents.

1% to 10%:

Central nervous system: Headache (7%)

Neuromuscular & skeletal: Myalgia (4%), pain in extremity (2%)

Respiratory: Upper respiratory infection (4%)

Miscellaneous: Influenza (3%)

Metabolism/Transport EffectsSimvastatin: **Substrate** of CYP3A4 (major); **Inhibits** CYP2C8 (weak), 2C9 (weak), 2D6 (weak)

Drug Interactions

Amiodarone: May decrease the metabolism of HMG-CoA Reductase Inhibitors. Management: Dose of HMG-CoA reductase inhibitor may need to be reduced (e.g., simvastatin prescribing information recommends not exceeding 20 mg/day during concurrent therapy). *Risk D: Consider therapy modification*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Bile Acid Sequestrants: May decrease the absorption of Ezetimibe. *Risk C: Monitor therapy*

Bosentan: May increase the metabolism of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Colchicine: May enhance the myopathic (rhabdomyolysis) effect of HMG-CoA Reductase Inhibitors. Colchicine may increase the serum concentration of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

CycloSPORINE: May increase the serum concentration of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

CycloSPORINE: May increase the serum concentration of Ezetimibe. Ezetimibe may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Danazol: May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

DAPTOmycin: HMG-CoA Reductase Inhibitors may enhance the adverse/toxic effect of DAPTOmycin. Specifically, the risk of skeletal muscle toxicity may be increased. Management: Consider temporarily stopping HMG-CoA reductase inhibitor therapy prior to daptomycin. If used together, regular (i.e., at least weekly) monitoring of CPK concentrations is recommended. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Etravirine: May decrease the serum concentration of HMG-CoA Reductase Inhibitors. This applies to atorvastatin, lovastatin and simvastatin. Conversely, levels of fluvastatin may be increased. Management: Dose adjustment of the HMG-CoA reductase inhibitor may be warranted. No interaction is expected with rosuvastatin or pravastatin. *Risk C: Monitor therapy*

Fenofibrate: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Fibric Acid Derivatives: May increase the serum concentration of Ezetimibe. *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Gemfibrozil: May enhance the myopathic (rhabdomyolysis) effect of HMG-CoA Reductase Inhibitors. Gemfibrozil may increase the serum concentration of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Grapefruit Juice: May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Imatinib: May decrease the metabolism of Simvastatin. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of HMG-CoA Reductase Inhibitors. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Nefazodone: May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Niacin: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Niacinamide: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Phenytoin: May increase the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Protease Inhibitors: May increase the serum concentration of HMG-CoA Reductase Inhibitors. Limited data suggest pravastatin may slightly decrease protease inhibitor concentrations. Management: Lovastatin and simvastatin are contraindicated with many protease inhibitors; use lowest possible HMG-CoA reductase inhibitor dose and monitor for signs and symptoms of rhabdomyolysis if these agents are used concomitantly. *Risk D: Consider therapy modification*

Ranolazine: May increase the serum concentration of Simvastatin. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Sildenafil: May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

St Johns Wort: May increase the metabolism of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): HMG-CoA Reductase Inhibitors may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid excessive ethanol consumption (due to potential hepatic effects).

Food: Simvastatin serum concentration may be increased when taken with grapefruit juice; avoid concurrent intake of large quantities (>1 quart/day). Red yeast rice contains an estimated 2.4 mg lovastatin per 600 mg rice. Ezetimibe did not cause meaningful reductions in fat-soluble vitamin concentrations during a 2-week clinical trial. Effects of long-term therapy have not been evaluated.

Herb/Nutraceutical: St John's wort may decrease simvastatin levels.

Monitoring ParametersCreatine phosphokinase levels due to possibility of myopathy; serum cholesterol (total and fractionated)

Obtain liver function tests prior to initiation, dosage increase, and thereafter when clinically indicated. Patients titrated to the simvastatin 80 mg dose should be tested prior to initiation and 3 months after initiating the 80 mg dose. Thereafter, periodic monitoring (ie, semiannually) is recommended for the first year of treatment. Patients with elevated transaminase levels should have a second (confirmatory) test and frequent monitoring until values normalize. Discontinue if increase in ALT/AST is persistently >3 times ULN.

Nursing: Physical Assessment/MonitoringSee individual agents.

Patient EducationSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

10/10: Ezetimibe 10 mg and simvastatin 10 mg

10-40 mg (30): $100.99

10-80 mg (30): $100.99

Mechanism of Action

Ezetimibe: Inhibits absorption of cholesterol at the brush border of the small intestine, leading to a decreased delivery of cholesterol to the liver. Ezetimibe inhibits the enzyme Niemann-Pick C1-Like1 (NPC1L1), a sterol transporter.

Simvastatin: A methylated derivative of lovastatin that acts by competitively inhibiting 3-hydroxy-3-methylglutaryl-coenzyme A (HMG-CoA) reductase, the enzyme that catalyzes the rate-limiting step in cholesterol biosynthesis.

Pharmacodynamics/KineticsSee individual agents.

Bioavailability: Vytorin® is equivalent to coadministered ezetimibe and simvastatin.

Mental Health: Effects on Mental StatusMay cause dizziness or fatigue; may rarely cause anxiety, depression, insomnia, or memory loss

Mental Health: Effects on Psychiatric TreatmentRhabdomyolysis with acute renal failure has occurred; risk increased with concurrent use of fluvoxamine, nefazodone, and verapamil

Cardiovascular ConsiderationsHMG-CoA reductase inhibitors are effective in primary and secondary prevention of cardiovascular events in patients with hyperlipidemia. For primary prevention, a patient's major risk factors (cigarette smoking, hypertension or currently taking antihypertensives, low HDL-C, family history, age, gender) should be evaluated. Patients with multiple risk factors (≥2) require more intensive therapy guided by the calculation of a 10-year absolute CHD risk (eg, the percent probability of having a CHD event in next 10 years). An individual's 10-year absolute CHD risk can be calculated at www.med-decisions.com/cvtool/phys/phys.html. LDL cholesterol goals, therapeutic lifestyle changes, and drug therapy are determined based upon a patient's risk factor profile.

Primary prevention trials show that cholesterol-lowering drugs reduce the risk of major coronary events, coronary death, and cerebrovascular events even in the first 6-12 months of use. The WOSCOP trial suggested a trend towards enhanced survival using pravastatin in their patients (mean LDL-cholesterol of 192 mg/dL and no history of MI). In a recent trial (Sever, 2003), patients with HTN and at least three other risk factors were randomized to 10 mg daily of atorvastatin or placebo. These patients had a total nonfasting cholesterol <250 mg/dL before treatment. LDL-C levels were 132 mg/dL before treatment and fell to an average of 90 mg/dL in the atorvastatin-treated group. There was a significant reduction in stroke, cardiovascular events, and coronary events in the atorvastatin-treated group as compared to the placebo group. There was no difference in mortality between the groups.

Secondary prevention trials indicate that “statin” therapy reduces mortality, major coronary events, coronary artery procedures, and stroke. The Heart Protection Study proved that lowering serum cholesterol levels reduces the rate of major vascular events among high-risk individuals with documented vascular disease (CHD, cerebrovascular, peripheral vascular) or diabetes regardless of initial cholesterol concentrations. PROVE IT is a randomized, double-blind trial evaluating hospitalized patients with acute coronary syndrome to determine the effects of intense LDL-C lowering therapy. Four thousand patients with an LDL-C levels of 106 mg/dL were randomized to pravastatin 40 mg daily or atorvastatin 80 mg daily. After 2 years, the combined cardiovascular endpoint (death, MI, unstable angina requiring hospitalization, revascularization and stroke) was ~26% in the pravastatin patients (median LDL-C 95 mg/dL) and ~22% in the atorvastatin treated patients (median LDL-C 62 mg/dL).

LaRosa and colleagues assessed the efficacy and safety of lowering LDL cholesterol <100 mg/dL in patients with stable coronary heart disease (LaRosa, 2005). Ten thousand and one patients with baseline LDL levels <130 mg/dL were randomized to atorvastatin 10 mg or 80 mg daily and followed for a median of 4.9 years. The primary endpoint was the occurrence of the first major cardiovascular event (death from CVD, MI, resuscitation after cardiac arrest, or stroke). A primary event occurred in 434 patients (8.7%) receiving 80 mg daily (mean LDL 77 mg/dL) and 548 patients (10.9%) receiving 10 mg dose (mean LDL 101 mg/dL) (95% CI, 0.69-0.89; p <0.001). There was no mortality difference between the two treatment groups.

HMG-CoA reductase inhibitors decrease levels of high-sensitivity C-reactive protein (hs-CRP). They also possess pleiotropic properties including improved endothelial function, reduced inflammation at the site of the coronary plaque, inhibition of platelet aggregation, and anticoagulant effects. These nonlipid effects may be beneficial when HMG-CoA reductase inhibitors are introduced early in the management of acute coronary syndromes (de Denus, 2002).

Myopathy: Currently-marketed HMG-CoA reductase inhibitors appear to have a similar potential for causing myopathy. Incidence of severe myopathy is about 0.08% to 0.09%. The factors that increase risk include advanced age (especially >80 years of age), women more frequently than men, small body frame, frailty, multisystem disease (eg, chronic renal insufficiency especially due to diabetes), multiple medications, drug interactions (use with caution or avoid). The combination of a HMG-CoA reductase inhibitor plus nicotinic acid seems to carry a lower risk of myopathy than does a HMG-CoA reductase inhibitor plus a fibrate. Other medications, when used concurrently, may enhance the risk of myopathy associated with statins; these include drugs that inhibit CYP3A4 isoenzymes (lovastatin, simvastatin, atorvastatin) or CYP2C9 isoenzymes (fluvastatin). HMG-CoA reductase inhibitors may exacerbate exercise-induced skeletal muscle injury. Many experts favor getting a baseline creatine kinase (CK) measurement before initiating therapy (asymptomatic CK elevations are common). Obtain a CK measurement if patient complains of muscle soreness, tenderness, or pain.

Anesthesia and Critical Care Concerns/Other ConsiderationsBased on the simvastatin component: **Myopathy:** Currently-marketed HMG-CoA reductase inhibitors appear to have a similar potential for causing myopathy. Incidence of severe myopathy is about 0.08% to 0.09%. The factors that increase risk include advanced age (especially >80 years), gender (occurs in women more frequently than men), small body frame, frailty, multisystem disease (eg, chronic renal insufficiency especially due to diabetes), multiple medications, and drug interactions (use with caution or avoid).

Based on current research, HMG-CoA reductase inhibitors should be continued in the perioperative period. Postoperative discontinuation of statin therapy is associated with an increased risk of cardiac morbidity and mortality.

Index TermsSimvastatin and Ezetimibe

Ezetimibe (Zetia®), Simvastatin (Zocor®), and Ezetimibe/Simvastatin (Vytorin®): Preliminary Results From the SEAS Trial - Updated September 2008

The U.S. Food and Drug Administration (FDA) has communicated important information regarding an ongoing safety review of the Simvastatin and Ezetimibe in Aortic Stenosis (SEAS) trial. The SEAS trial (Rossebo, 2008), recently available online, evaluated the effects of the combination ezetimibe/simvastatin (Vytorin®) on clinical outcomes in patients with mild-to-moderate asymptomatic aortic stenosis. The 5-year trial demonstrated that ezetimibe/simvastatin was no better than placebo in reducing the primary composite outcomes – major cardiovascular events (eg, death from cardiovascular causes, aortic-valve replacement, heart failure) or the composite outcome of aortic-valve-related clinical events and ischemia. Additionally, a higher incidence of newly diagnosed cancer of any type (105 patients taking ezetimibe/simvastatin vs 70 patients taking placebo, p=0.01) and cancer-related death (39 patients taking ezetimibe/simvastatin vs 23 patients taking placebo, p=0.05) was observed in the patients receiving ezetimibe/simvastatin compared to those receiving placebo. Of note, 8 patients diagnosed with cancer prior to randomization experienced recurrence (3 in the ezetimibe/simvastatin group vs 5 in the placebo group).

Subsequently, an interim analysis of the ongoing Study of Heart and Renal Protection (SHARP) trial and the Improved Reduction of Outcomes: Vytorin Efficacy International Trial (IMPROVE-IT) with a total of 20,617 randomized patients demonstrated no overall excess of cancer (313 active-treatment vs 326 control, p=0.61) (Peto, 2008). The SHARP trial randomized patients with chronic kidney disease to either ezetimibe/simvastatin or placebo. The IMPROVE-IT trial randomized patients with acute coronary syndrome to either ezetimibe/simvastatin or simvastatin alone. When the SEAS trial data is included in this analysis, there still is no significant excess of cancer (414 active-treatment vs 391 control, p=0.46). However, cancer-associated deaths were significantly higher when compared to controls (134 vs 92, respectively; p=0.007). Previous trials and meta-analyses involving the use of ezetimibe, simvastatin, or ezetimibe/simvastatin also have not shown an increased risk of cancer.

The FDA estimates that it will take approximately 6 months to fully evaluate the clinical trial data after receipt of the final SEAS trial report. At this time, the FDA recommends that patients continue taking their cholesterol-lowering medications.

For more information, U.S. healthcare professionals may refer to the following:

FDA: http://www.fda.gov/medwatch/safety/2008/safety08.htm#ezetimibe2

Rossebo AB, Pederson TR, Boman K, et al, "Intensive Lipid Lowering With Simvastatin and Ezetimibe in Aortic Stenosis," *N Engl J Med*, 2008, http://content.nejm.org/cgi/content/full/NEJMoa0804602

Ezetimibe/Simvastatin (Vytorin®), Ezetimibe (Zetia®), and Simvastatin (Zocor®): ENHANCE Results - January 2008

The U.S. Food and Drug Administration (FDA) is communicating important information regarding the preliminary results of the Effect of Combination Ezetimibe and High-Dose Simvastatin vs. Simvastatin Alone on the Atherosclerotic Process in Patients with Heterozygous Familial Hypercholesterolemia (ENHANCE) trial, originally released on January 14, 2008, by Merck/Schering Plough. This multinational, randomized, double-blind trial was conducted in 720 patients with heterozygous familial hypercholesterolemia (HeFH) over a two-year period. Patients were randomized to either ezetimibe 10 mg/simvastatin 80 mg (Vytorin®) or simvastatin 80 mg alone (Zocor®). The primary endpoint of the trial was mean change in carotid intima-media thickness (CIMT) which is a surrogate endpoint believed to translate in a reduction of future cardiovascular events. It is important to note that this was an imaging trial and was not powered for clinical outcomes (eg, MI, stroke). Although ezetimibe/simvastatin lowered LDL cholesterol more effectively as compared to simvastatin alone, there was no difference seen in mean change in CIMT. Adverse events were similar between both groups.

Upon completion of full data analysis, the manufacturer will submit a final report to the FDA. Once the report is received, the FDA estimates it will take about 6 months to fully evaluate the data and decide whether or not further regulatory action is necessary. Three large clinical outcome trials evaluating the use of ezetimibe/simvastatin will be presented over the next 2-3 years.

At this point in time, patients should not stop taking their ezetimibe/simvastatin (Vytorin®), ezetimibe (Zetia®), or simvastatin (Zocor®). Instead patients should talk with their healthcare provider if they have questions about the ENHANCE trial.

For more information, U.S. healthcare professionals may refer to the following:

FDA: http://www.fda.gov/medwatch/safety/2008/safety08.htm#Ezetimibe

American College of Cardiology (ACC) Statement on ENHANCE Trial: http://www.acc.org/enhance.htm

Medication Safety Issues

Sound-alike/look-alike issues:

Zetia® may be confused with Zebeta®, Zestril®

Pronunciation(ez ET i mibe)
U.S. Brand NamesZetia®
Canadian Brand NamesEzetrol®
Pharmacologic CategoryAntilipemic Agent, 2-Azetidinone
Use: Labeled IndicationsUse in combination with dietary therapy for the treatment of primary hypercholesterolemia (as monotherapy or in combination with HMG-CoA reductase inhibitors); homozygous sitosterolemia; homozygous familial hypercholesterolemia (in combination with atorvastatin or simvastatin); mixed hyperlipidemia (in combination with fenofibrate)
Dosing: Adults**Hyperlipidemias, sitosterolemia:** Oral: 10 mg/day
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricChildren ≥10 years: Refer to adult dosing.
Dosing: Renal ImpairmentAUC increased with severe impairment (Cl_{cr} <30 mL/minute); no dosing adjustment recommended.
Dosing: Hepatic Impairment AUC increased with hepatic impairment:

Mild impairment (Child-Pugh class A): No dosing adjustment necessary.

Moderate-to-severe impairment (Child-Pugh classes B and C): Use of ezetimibe not recommended.

Administration: OralMay be administered without regard to meals. May be taken at the same time as HMG-CoA reductase inhibitors. Administer ≥2 hours before or ≥4 hours after bile acid sequestrants.
Dietary ConsiderationsMay be taken without regard to meals. Before initiation of therapy, patients should be placed on a standard cholesterol-lowering diet for 6 weeks and the diet should be continued during drug therapy.
StorageStore at controlled room temperature of 25°C (77°F). Protect from moisture.
ContraindicationsHypersensitivity to ezetimibe or any component of the formulation; concomitant use with an HMG-CoA reductase inhibitor in patients with active hepatic disease, unexplained persistent elevations in serum transaminases; pregnancy; breast-feeding
Warnings/Precautions

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with mild hepatic impairment (Child-Pugh class A); not recommended for use with moderate or severe hepatic impairment (Child-Pugh classes B and C).

- Renal impairment: Use with caution in patients with severe renal impairment (Cl_{cr} <30 mL/minute).

Concurrent drug therapy issues:

- Fibric acid derivatives (eg, fenofibrate, gemfibrozil): Concurrent use of fibric acid derivatives may increase the risk of cholelithiasis.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <10 years of age.

Other warnings/precautions:

- Hyperlipidemia: Secondary causes of hyperlipidemia should be ruled out prior to therapy.

Pregnancy Risk FactorC
Pregnancy ConsiderationsSafety and efficacy have not been established; use during pregnancy only if the potential benefit to the mother outweighs the possible risk to the fetus.
LactationExcretion in breast milk unknown/not recommended
Adverse Reactions

1% to 10%:

Central nervous system: Fatigue (2%)

Gastrointestinal: Diarrhea (4%)

Hepatic: Transaminases increased (with HMG-CoA reductase inhibitors) (≥3 x ULN, 1%)

Neuromuscular & skeletal: Arthralgia (3%), pain in extremity (3%)

Respiratory: Upper respiratory tract infection (4%), sinusitis (3%)

Miscellaneous: Influenza (2%)

Postmarketing and/or case reports: Anaphylaxis, angioedema, autoimmune hepatitis (Stolk, 2006), cholecystitis, cholelithiasis, cholestatic hepatitis (Stolk, 2006), CPK increased, depression, dizziness, hepatitis, hypersensitivity reactions, myalgia, myopathy, nausea, pancreatitis, paresthesia, rash, rhabdomyolysis, thrombocytopenia, urticaria

Drug Interactions

Bile Acid Sequestrants: May decrease the absorption of Ezetimibe. *Risk C: Monitor therapy*

CycloSPORINE: May increase the serum concentration of Ezetimibe. Ezetimibe may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

Fibric Acid Derivatives: May increase the serum concentration of Ezetimibe. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: Ezetimibe did not cause meaningful reductions in fat-soluble vitamin concentrations during a 2-week clinical trial. Effects of long-term therapy have not been evaluated.

Monitoring ParametersTotal cholesterol profile prior to therapy, and when clinically indicated and/or periodically thereafter. When used in combination with fenofibrate, monitor LFTs and signs and symptoms of cholelithiasis.

Nursing: Physical Assessment/MonitoringUse caution in presence of renal or hepatic impairment. Assess potential for interactions with other pharmacological agents or herbal products patient may be taking (eg, timing of concurrent medication). Assess results of laboratory tests (lipid profile), therapeutic effectiveness, and adverse response at beginning of and at regular intervals during therapy. Teach patient proper use, possible side effects/appropriate interventions, and adverse reactions to report (eg, signs of hepatic, muscle, or pancreatic adverse reactions).

Monitoring: Lab TestsTotal cholesterol profile prior to therapy, and when clinically indicated and/or periodically thereafter. When used in combination with fenofibrate, monitor LFTs and signs and symptoms of cholelithiasis.

Patient EducationDo not take any new medication during therapy without consulting prescriber. Take at the same time of day, without regard for meals. Take 2 hours before or 4 hours after bile acid binding agents (ie, Questran®). This medication does not replace the need for dietary and exercise recommendations of prescriber. May cause headache, dizziness, or fatigue (use caution when driving or engaged in potentially hazardous tasks until response to drug is known); diarrhea (boiled milk, buttermilk, or yogurt may help); abdominal pain. Report any yellowing of skin or sclera; dark urine or pale stools; excessive tiredness; chest pain or palpitations; muscle, skeletal, or joint pain; twitching or numbness; increased perspiration; changes in urinary pattern; or other persistent side effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Zetia®: 10 mg

Generic AvailableNo

ManufacturerMerck/Schering-Plough Pharmaceuticals

Pricing: U.S. (www.drugstore.com)

Tablets (Zetia)

10 mg (30): $99.98

Mechanism of ActionInhibits absorption of cholesterol at the brush border of the small intestine via the sterol transporter, Niemann-Pick C1-Like1 (NPC1L1). This leads to a decreased delivery of cholesterol to the liver, reduction of hepatic cholesterol stores and an increased clearance of cholesterol from the blood; decreases total C, LDL-cholesterol (LDL-C), ApoB, and triglycerides (TG) while increasing HDL-cholesterol (HDL-C).

Pharmacodynamics/Kinetics

Protein binding: >90% to plasma proteins

Metabolism: Undergoes glucuronide conjugation in the small intestine and liver; forms metabolite (active); may undergo enterohepatic recycling

Bioavailability: Variable

Half-life elimination: 22 hours (ezetimibe and metabolite)

Time to peak, plasma: 4-12 hours

Excretion: Feces (78%, 69% as ezetimibe); urine (11%, 9% as metabolite)

Related Information

- Hyperlipidemia Management
- Lipid-Lowering Agents

Pharmacotherapy PearlsWhen studied in combination with fenofibrate for mixed hyperlipidemia, the dose of fenofibrate was 160 mg daily.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness and fatigue

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular ConsiderationsEzetimibe decreases cholesterol concentrations by inhibiting the oral absorption of cholesterol. More specifically, ezetimibe inhibits the cholesterol transport system located within intestinal cell walls. Ezetimibe lowers LDL-C by ~18%. Additionally, it lowers TGs by ~5% and raises HDL-C by ~3%. Peak effects of ezetimibe are reached at 2 weeks. Ezetimibe does not interfere with the absorption of fat soluble vitamins. Ezetimibe can be taken concurrently with an HMG-CoA reductase inhibitor or fenofibrate. Asymptomatic increase in transaminase elevations (>3 times ULN) occurs at a slightly higher incidence (1.3%) when used concurrently with a HMG-CoA reductase inhibitor than with the HMG-CoA reductase inhibitor alone (0.4%). Use of ezetimibe and fenofibrate (160 mg daily) may increase rate of cholecystectomy.

Given the lack of clinical outcome data, the use of ezetimibe as initial monotherapy in treating hyperlipidemia would not be expected unless a patient was intolerant to HMG-CoA reductase inhibitor treatment. Ezetimibe enhances the LDL-C lowering effect of HMG-CoA reductase inhibitors by an additional 15% to 20%; and therefore, may be helpful in combination with an HMG-CoA reductase inhibitor to reach therapeutic goals. Ezetimibe may also be useful as combined therapy in patients who require a lower dose of HMG-CoA reductase inhibitor because they developed side effects when using a higher dose. Ezetimibe is also indicated in the treatment of sitosterolemia.

RegimenNOTE: Multiple variations are listed below.

Variation 1:

Fluorouracil: I.V.: 500 mg/m^2/day days 1 and 8

[total dose/cycle = 1000 mg/m^2]

or 500 mg/m^2 day 1

[total dose/cycle = 500 mg/m^2]

Doxorubicin: I.V.: 50 mg/m^2 day 1

[total dose/cycle = 50 mg/m^2]

Cyclophosphamide: I.V.: 500 mg/m^2 day 1

[total dose/cycle = 500 mg/m^2]

Repeat cycle every 21-28 days

Variation 2:

Fluorouracil: I.V.: 200 mg/m^2/day days 1, 2, and 3

[total dose/cycle = 600 mg/m^2]

Doxorubicin: I.V.: 40 mg/m^2 day 1

[total dose/cycle = 40 mg/m^2]

Cyclophosphamide: I.V.: 400 mg/m^2 day 1

[total dose/cycle = 400 mg/m^2]

Repeat cycle every 28 days

Variation 3:

Fluorouracil: I.V.: 400 mg/m^2/day days 1 and 8

[total dose/cycle = 800 mg/m^2]

Doxorubicin: I.V.: 40 mg/m^2 day 1

[total dose/cycle = 40 mg/m^2]

Cyclophosphamide: I.V.: 400 mg/m^2 day 1

[total dose/cycle = 400 mg/m^2]

Repeat cycle every 28 days

Variation 4:

Fluorouracil: I.V.: 600 mg/m^2/day days 1 and 8

[total dose/cycle = 1200 mg/m^2]

Doxorubicin: I.V.: 60 mg/m^2 day 1

[total dose/cycle = 60 mg/m^2]

Cyclophosphamide: I.V.: 600 mg/m^2 day 1

[total dose/cycle = 600 mg/m^2]

Repeat cycle every 28 days

Variation 5:

Fluorouracil: I.V.: 300 mg/m^2/day days 1 and 8

[total dose/cycle = 600 mg/m^2]

Doxorubicin: I.V.: 30 mg/m^2 day 1

[total dose/cycle = 30 mg/m^2]

Cyclophosphamide: I.V.: 300 mg/m^2 day 1

[total dose/cycle = 300 mg/m^2]

Repeat cycle every 28 days

Factor IX Complex (Human)

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(FAK ter nyne KOM pleks HYU man)

U.S. Brand NamesBebulin® VH; Profilnine® SD; Proplex® T [DSC]

Pharmacologic CategoryAntihemophilic Agent; Blood Product Derivative; Prothrombin Complex Concentrate (PCC)

Use: Labeled IndicationsControl bleeding in patients with factor IX deficiency (hemophilia B or Christmas disease) **Note:** Factor IX concentrate containing **only** factor IX is also available and preferable for this indication.

Use: Unlabeled/InvestigationalEmergency correction of the coagulopathy of warfarin excess in critical situations.**Note:** Products contain low or nontherapeutic levels of factor VII component.

Dosing: Adults

Bleeding in factor IX deficiency: I.V. (only):

Note: Dosage is expressed in units of factor IX activity and must be individualized.

Formula for units required to raise blood level %:

Total blood volume (mL blood/kg) = 70 mL/kg (adults), 80 mL/kg (children)

Plasma volume = total blood volume (mL) x [1 - Hct (in decimals)]

For example, for a 70 kg adult with a Hct = 40%: Plasma volume = [70 kg x 70 mL/kg] x [1 - 0.4] = 2940 mL

To calculate number of units needed to increase level to desired range (highly individualized and dependent on patient's condition): Number of units = desired level increase [desired level - actual level] x plasma volume (in mL)

For example, for a 100% level in the above patient who has an actual level of 20%: Number of units needed = [1 (for a 100% level) - 0.2] x 2940 mL = 2352 units

As a general rule, the level of factor IX required for treatment of different conditions is listed below:

Minor Spontaneous Hemorrhage, Prophylaxis:

Desired levels of factor IX for hemostasis: 15% to 25%

Initial loading dose to achieve desired level: <20-30 units/kg

Frequency of dosing: Once; repeated in 24 hours if necessary

Duration of treatment: Once; repeated if necessary

Major Trauma or Surgery:

Desired levels of factor IX for hemostasis: 25% to 50%

Initial loading dose to achieve desired level: <75 units/kg

Frequency of dosing: Every 18-30 hours, depending on half-life and measured factor IX levels

Duration of treatment: Up to 10 days, depending upon nature of insult

Anticoagulant overdosage (unlabeled use): I.V.: 15 units/kg

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to adult dosing.

Administration: I.V.I.V. administration only; should be infused **slowly**. Rate should not exceed 2 mL/minute for Bebulin® VH, 3 mL/minute for Proplex® T, or 10 mL/minute for Profilnine® SD.

StorageWhen stored at refrigerator temperature, 2°C to 8°C (36°F to 46°F), coagulation factor IX is stable for the period indicated by the expiration date on its label. Avoid freezing which may damage container for the diluent. Once diluted, should be used promptly; stable for up to 3 hours.

Reconstitution

Refer to instructions for individual products. Diluent and factor IX complex should come to room temperature before combining. Diluent vial should be inverted over concentrate vial. After diluent is pulled, disconnect. The provided filter needle should be used to withdraw concentrate. Remove needle and attach to infusion set or replace needle for infusion.

ContraindicationsLiver disease with signs of intravascular coagulation or fibrinolysis; not for use in factor VII deficiencies, patients undergoing elective surgery

Warnings/Precautions

Concerns related to adverse effects:

- Thrombotic events: Thromboembolic complications rarely occur; more likely to occur during postoperative period or in patients with risk factors.

- Unstable vital signs: Treatment should stop if respiratory distress or any changes in blood pressure or pulse rate occur.

Disease-related concerns:

- Hepatic impairment: Use with extreme caution in patients with hepatic impairment.

Dosage form specific issues:

- Human plasma: Product of human plasma; may potentially contain infectious agents which could transmit disease. Screening of donors, as well as testing and/or inactivation or removal of certain viruses, reduces the risk. Infections thought to be transmitted by this product should be reported to the manufacturer.

Pregnancy Risk FactorC

Adverse Reactions

1% to 10%:

Central nervous system: Fever, headache, chills

Neuromuscular & skeletal: Tingling

Miscellaneous: Following rapid administration: Transient fever

<1%: Disseminated intravascular coagulation (DIC), flushing, nausea, somnolence, thrombosis (following high dosages because of presence of activated clotting factors), tightness in chest, tightness in neck, urticaria, vomiting

Drug Interactions

Aminocaproic Acid: May enhance the adverse/toxic effect of Factor IX Complex (Human). Specifically, use of this combination may increase the risk of thrombosis. *Risk X: Avoid combination*

Monitoring ParametersLevels of factors being replaced (eg, VII or IX), PT, PTT

Reference RangeAverage normal factor VII and factor IX levels are 50% to 150%; patients with severe hemophilia will have levels <1%, often undetectable. Moderate forms of the disease have levels of 1% to 10% while some mild cases may have 11% to 49% of normal factor IX.

Maintain factor IX plasma level at least 20% until hemostasis achieved after acute joint or muscle bleeding.

In preparation for and following surgery:

Level to prevent spontaneous hemorrhage: 5%

Minimum level for hemostasis following trauma and surgery: 30% to 50%

Severe hemorrhage: >60%

Major surgery: >60% prior to procedure, 30% to 50% for several days after surgery, and >20% for 7-10 days thereafter

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Injection, powder for reconstitution (**Note:** Exact potency labeled on each vial):

Bebulin® VH [single-dose vial; vapor heated; supplied with sterile water for injection]

Profilnine® SD [single-dose vial; solvent detergent treated]

Proplex® T [single-dose vial; heat treated; supplied with sterile water for injection] [DSC]

Generic AvailableNo

Mechanism of ActionReplaces deficient clotting factor including factor X; hemophilia B, or Christmas disease, is an X-linked recessively inherited disorder of blood coagulation characterized by insufficient or abnormal synthesis of the clotting protein factor IX. Factor IX is a vitamin K-dependent coagulation factor which is synthesized in the liver. Factor IX is activated by factor XIa in the intrinsic coagulation pathway. Activated factor IX (IXa), in combination with factor VII:C, activates factor X to Xa, resulting ultimately in the conversion of prothrombin to thrombin and the formation of a fibrin clot. The infusion of exogenous factor IX to replace the deficiency present in hemophilia B temporarily restores hemostasis.

Pharmacodynamics/Kinetics

Half-life elimination:

VII component: Initial: 4-6 hours; Terminal: 22.5 hours

IX component: 24 hours

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay rarely cause sedation
Mental Health: Effects on Psychiatric TreatmentNone reported
Anesthesia and Critical Care Concerns/Other Considerations

Management of Intracerebral Hemorrhage (ICH) Due to Warfarin: Overall management of ICH is similar regardless of cause, however, iatrogenic spontaneous ICH may have specific treatments. According to the 2007 ACC/ASA Guidelines for the Management of Spontaneous Intracerebral Hemorrhage, warfarin-related ICH should be treated with I.V. vitamin K at a dose of 10 mg given slowly (not to exceed 1 mg/minute) (Class I recommendation). It is important to also administer fresh frozen plasma (FFP) since vitamin K may take several hours to normalize INR. Other options besides FFP include prothrombin complex concentrate (PCC) which contains high levels of vitamin K-dependent factors (II, VII, and X) and factor IX complex which contains factors II, VII, IX, and X (Class IIb recommendation). Use of rFVIIa has shown promise for this indication. Advantages to rFVIIa include faster onset of action compared to FFP and vitamin K and a 50% lower volume is required compared to FFP. Disadvantages include a short half-life (~2.6 hours) requiring multiple doses to maintain a normalized INR and an increased risk of thromboembolic complications. Dosing of rFVIIa ranges between 15-90 mcg/kg. The use of factor-containing products has a risk of thromboembolism.

U.S. Brand NamesAlphaNine® SD; BeneFix®; Mononine®

Canadian Brand NamesBeneFix®; Immunine® VH; Mononine®

Pharmacologic CategoryAntihemophilic Agent; Blood Product Derivative

Use: Labeled IndicationsControl bleeding in patients with factor IX deficiency (hemophilia B or Christmas disease)

Dosing: Adults**Control bleeding in patients with factor IX deficiency (hemophilia B or Christmas disease):** Dosage is expressed in int. units of factor IX activity; dosing must be individualized based on severity of factor IX deficiency, extent and location of bleeding, and clinical status of patient:

Formula for int. units required to raise blood level %:

AlphaNine® SD, Mononine®: I.V.:

Number of factor IX int. units required = body weight (in kg) x desired factor IX level increase (int. units/dL or % of normal) x 1 int. unit/kg

For example, for a 100% level a patient who has an actual level of 20%: Number of factor IX int. units needed = 70 kg x 80% x 1 int. unit/kg = 5600 int. units

BeneFix®: I.V.: Number of factor IX int. units required = body weight (in kg) x desired factor IX level increase (int. units/dL or % of normal) x 1.3 int. units/kg

Guidelines: As a general rule, the level of factor IX required for treatment of different conditions is listed below:

Minor spontaneous hemorrhage, prophylaxis:

Desired levels of factor IX for hemostasis: 15% to 25%

Initial loading dose to achieve desired level: 20-30 int. units/kg

Frequency of dosing: Every 12-24 hours if necessary

Duration of treatment: 1-2 days

Moderate hemorrhage:

Desired levels of factor IX for hemostasis: 25% to 50%

Initial loading dose to achieve desired level: 25-50 int. units/kg

Frequency of dosing: Every 12 -24 hours

Duration of treatment: 2-7 days

Major hemorrhage:

Desired levels of factor IX for hemostasis: >50%

Initial loading dose to achieve desired level: 30-50 int. units/kg

Frequency of dosing: Every 12-24 hours, depending on half-life and measured factor IX levels (after 3-5 days, maintain at least 20% activity)

Duration of treatment: 7-10 days, depending upon nature of insult

Surgery or major trauma:

Desired levels of factor IX for hemostasis: 50% to 100%

Initial loading dose to achieve desired level: 50-100 int. units/kg

Frequency of dosing: Every 12-24 hours or every 18-30 hours, depending on half-life and measured factor IX levels

Duration of treatment: 7-10 days, depending upon nature of insult

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Control bleeding in patients with factor IX deficiency (hemophilia B or Christmas disease):** Dosage is expressed in int. units of factor IX activity; dosing must be individualized based on severity of factor IX deficiency, extent and location of bleeding, and clinical status of patient:

AlphaNine® SD, Mononine®: I.V.: Refer to adult dosing.

BeneFix®: I.V.:

Children <15 years:

Formula for int. units required to raise blood level %:

Number of factor IX int. units required = body weight (in kg) x desired factor IX level increase (int. units/dL or % of normal) x 1.4 int. units/kg

Children ≥15 years: Refer to adult dosing.

Guidelines: As a general rule, the level of factor IX required for treatment of different conditions is listed below:

Minor spontaneous hemorrhage, prophylaxis:

Desired levels of factor IX for hemostasis: 15% to 25%

Initial loading dose to achieve desired level: 20-30 int. units/kg

Frequency of dosing: Every 12-24 hours if necessary

Duration of treatment: 1-2 days

Moderate hemorrhage:

Desired levels of factor IX for hemostasis: 25% to 50%

Initial loading dose to achieve desired level: 25-50 int. units/kg

Frequency of dosing: Every 12 -24 hours

Duration of treatment: 2-7 days

Major hemorrhage:

Desired levels of factor IX for hemostasis: >50%

Initial loading dose to achieve desired level: 30-50 int. units/kg

Frequency of dosing: Every 12-24 hours, depending on half-life and measured factor IX levels (after 3-5 days, maintain at least 20% activity)

Duration of treatment: 7-10 days, depending upon nature of insult

Surgery or major trauma:

Desired levels of factor IX for hemostasis: 50% to 100%

Initial loading dose to achieve desired level: 50-100 int. units/kg

Frequency of dosing: Every 12-24 hours or every 18-30 hours, depending on half-life and measured factor IX levels

Duration of treatment: 7-10 days, depending upon nature of insult

Administration: I.V.Solution should be infused at room temperature

I.V. administration only: Should be infused **slowly**: The rate of administration should be determined by the response and comfort of the patient.

AlphaNine® SD: Administer I.V. at a rate not exceeding 10 mL/minute

BeneFix®: Administer I.V. over several minutes

Mononine®: Administer I.V. at a rate of ~2 mL/minute. Administration rates of up to 225 int. units/minute have been regularly tolerated without incident (when reconstituted as directed to ~100 int. units/mL).

StorageWhen stored at refrigerator temperature, 2°C to 8°C (36°F to 46°F), coagulation factor IX is stable for the period indicated by the expiration date on its label. Avoid freezing which may damage container for the diluent.

AlphaNine® SD: May also be stored at room temperature not to exceed 30°C (86°F) for up to 1 month,

BeneFix®: May also be stored at room temperature not to exceed 25°C (77°F) for up to 6 months. Reconstituted solution at room temperature should be used within 3 hours.

Mononine®: May also be stored at room temperature not to exceed 25°C (77°F) for up to 1 month.

ReconstitutionRefer to instructions for individual products. Diluent and factor IX complex should come to room temperature before combining.

ContraindicationsHypersensitivity to mouse protein (Mononine®) or hamster protein (BeneFix®)

Warnings/Precautions

Concerns related to adverse effects:

- Antibody formation: The development of factor IX antibodies (or inhibitors) has been reported with factor IX therapy; the risk of severe hypersensitivity reactions occurring may be greater in these patients.

- Hypersensitivity reactions: Hypersensitivity and anaphylactic reactions have been reported with use. Delayed reactions (up to 20 days after infusion) in previously untreated patients may also occur. Due to potential for allergic reactions, the initial ~10-20 administrations should be performed under appropriate medical supervision. Hypersensitivity reactions may be associated with factor IX inhibitor development; patients experiencing allergic reactions should be evaluated for factor IX inhibitors.

- Thrombotic events: Observe closely for signs or symptoms of intravascular coagulation or thrombosis; risk is generally associated with the use of factor IX complex concentrates (containing theurapeutic amounts of additional factors); however, potential risk exists with use of factor IX products (containing only factor IX). Use with caution when administering to patients with liver disease, postoperatively, neonates, or patients at risk of thromboembolic phenomena, disseminated intravascular coagulation or patients with signs of fibrinolysis due to the potential risk of thromboembolic complications.

Disease-related concerns:

- Hepatic impairment: Use with extreme caution in patients with hepatic impairment due to the risk of thromboembolic complications.

Dosage form specific issues:

- AlphaNine® SD, Mononine®: Contain **nondetectable levels of factors II, VII, and X** and are, therefore, **NOT INDICATED** for replacement therapy of any of these clotting factors.

- Human plasma (AlphaNine® SD, Mononine®): Product of human plasma; may potentially contain infectious agents which could transmit disease. Screening of donors, as well as testing and/or inactivation or removal of certain viruses, reduces the risk. Infections thought to be transmitted by this product should be reported to the manufacturer.

Other warnings/precautions:

- Appropriate use: Factor IX is NOT INDICATED for the treatment or reversal of coumarin-induced anticoagulation, hemophilia A patients with Factor VIII inhibitors, or patients in a hemorrhagic state caused by reduced production of liver-dependent coagulation factors (eg, hepatitis, cirrhosis).

- Immune tolerance induction: Safety and efficacy have not been established in immune tolerance induction with factor IX products. Nephrotic syndrome has occurred following immune tolerance induction in patients with factor IX inhibitors and a history of allergic reactions to therapy.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. Safety and efficacy in pregnant women have not been established. Use during pregnancy only if clearly needed. Parvovirus B19 or hepatitis A, which may be present in plasma-derived products, may affect a pregnant woman more seriously than a nonpregnant woman.

Adverse ReactionsFrequency not defined.

Cardiovascular: Cyanosis, flushing, hypotension, chest tightness, thrombosis

Central nervous system: Chills, dizziness, drowsiness, fever (including transient fever following rapid administration), headache, lethargy, lightheadedness, somnolence

Dermatologic: Angioedema, photosensitivity reaction, rash, urticaria

Gastrointestinal: Abnormal taste, diarrhea, nausea, vomiting

Hematologic: Disseminated intravascular coagulation (DIC)

Hepatic: Alkaline phosphatase increased, ALT increased, AST increased

Local: Injection site reactions: Cellulitis, discomfort, pain, phlebitis, stinging

Neuromuscular & skeletal: Neck tightness, paresthesia, rigors

Ocular: Visual disturbance

Respiratory: Allergic rhinitis, asthma, cough, dyspnea, hypoxia, laryngeal edema, lung disorder

Miscellaneous: Allergic reaction, anaphylaxis, burning sensation in jaw/skull, factor IX inhibitor development, hypersensitivity reaction

Postmarketing and/or case reports: HAV seroconversion, inadequate response/recovery, nephrotic syndrome (associated with immune tolerance induction), parvovirus B19 seroconversion, renal infarction

Drug Interactions

Aminocaproic Acid: May enhance the adverse/toxic effect of Factor IX. Specifically, use of this combination may increase the risk of thrombosis. *Risk X: Avoid combination*

Monitoring ParametersLevels of factors IX, PTT, BP, HR, signs of hypersensitivity reactions

Reference RangeAverage normal factor IX levels are 50% to 150%; patients with severe hemophilia will have levels <1%, often undetectable. Moderate forms of the disease have levels of 1% to 10% while some mild cases may have 11% to 49% of normal factor IX.

Maintain factor IX plasma level at least 20% until hemostasis achieved after acute joint or muscle bleeding.

In preparation for and following surgery:

Level to prevent spontaneous hemorrhage: 5%

Minimum level for hemostasis following trauma and surgery: 30% to 50%

Severe hemorrhage: >50%

Major surgery: ≥50% prior to procedure and for 48 hours after surgery, and 30% to 50% for 10 days thereafter

Monitoring: Lab TestsLevels of factors IX, PTT

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution (**Note:** Exact potency labeled on each vial):

BeneFix® [contains polysorbate 80; sucrose 0.8%; recombinant formulation; supplied with diluent]

Injection, powder for reconstitution [human derived] (**Note:** Exact potency labeled on each vial):

AlphaNine® SD [contains polysorbate 80; solvent detergent treated; virus filtered; contains nondetectable levels of factors II, VII, X; supplied with diluent]

Mononine® [contains polysorbate 80; monoclonal antibody purified; contains nondetectable levels of factors II, VII, X; supplied with diluent]

Generic AvailableNo

Mechanism of ActionReplaces deficient clotting factor IX. Hemophilia B, or Christmas disease, is an X-linked inherited disorder of blood coagulation characterized by insufficient or abnormal synthesis of the clotting protein factor IX. Factor IX is a vitamin K-dependent coagulation factor which is synthesized in the liver. Factor IX is activated by factor XIa in the intrinsic coagulation pathway. Activated factor IX (IXa), in combination with factor VII:C activates factor X to Xa, resulting ultimately in the conversion of prothrombin to thrombin and the formation of a fibrin clot. The infusion of exogenous factor IX to replace the deficiency present in hemophilia B temporarily restores hemostasis.

Pharmacodynamics/KineticsHalf-life elimination: IX component: Adults: 21-31 hours; children: 14-28 hours

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay rarely cause sedation

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsFactor IX Concentrate

Medication Safety Issues

Sound-alike/look-alike issues:

NovoSeven® may be confused with Novacet®

Pronunciation(FAK ter SEV en aye ree KOM be nant)

U.S. Brand NamesNovoSeven [DSC]; NovoSeven® RT

Canadian Brand NamesNiastase®

Pharmacologic CategoryAntihemophilic Agent; Blood Product

Use: Labeled IndicationsTreatment of bleeding episodes and prevention of bleeding in surgical interventions in patients with hemophilia A or B with inhibitors to factor VIII or factor IX, acquired hemophilia, and in patients with congenital factor VII deficiency

Use: Unlabeled/InvestigationalReduction of hematoma growth in patients with acute intracerebral hemorrhage, warfarin-related intracerebral hemorrhage

Dosing: Adults Hemophilia A or B with inhibitors: For I.V. administration only:

Bleeding episodes: 90 mcg/kg every 2 hours until hemostasis is achieved or until the treatment is judged ineffective. The dose and interval may be adjusted based upon the severity of bleeding and the degree of hemostasis achieved. For patients experiencing severe bleeds, dosing should be continued at 3- to 6-hour intervals after hemostasis has been achieved and the duration of dosing should be minimized.

Surgical interventions: 90 mcg/kg immediately before surgery; repeat at 2-hour intervals for the duration of surgery. Continue every 2 hours for 48 hours, then every 2-6 hours until healed for minor surgery; continue every 2 hours for 5 days, then every 4 hours until healed for major surgery.

Congenital factor VII deficiency: Bleeding episodes and surgical interventions: 15-30 mcg/kg every 4-6 hours until hemostasis. Doses as low as 10 mcg/kg have been effective.

Acquired hemophilia: 70-90 mcg/kg every 2-3 hours until hemostasis is achieved.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to adult dosing.

Administration: I.V.I.V. administration only; bolus over 2-5 minutes. Administer within 3 hours after reconstitution.

Administration: I.V. DetailpH: 5.5

Dietary ConsiderationsContains sodium 0.44 mEq/mg rFVIIa

Storage

NovoSeven®: Store under refrigeration at 2°C to 8°C (36°F to 46°F). Protect from light. Reconstituted solutions may be stored at room temperature or under refrigeration, but must be infused within 3 hours of reconstitution. Do not freeze reconstituted solutions. Do not store reconstituted solutions in syringes.

NovoSeven® RT: Prior to reconstitution, store under refrigeration or between 2°C to 25°C (36°F to 77°F). Protect from light. Reconstituted solutions may be stored at room temperature or under refrigeration, but must be infused within 3 hours of reconstitution. Do not freeze reconstituted solutions. Do not store reconstituted solutions in syringes.

ReconstitutionPrior to reconstitution, bring vials to room temperature. Add recommended diluent along wall of vial; do not inject directly onto powder. Gently swirl until dissolved.

NovoSeven®: Reconstitute each vial to a final concentration of 0.6 mg/mL as follows:

1.2 mg vial: 2.2 mL sterile water

2.4 mg vial: 4.3 mL sterile water

4.8 mg vial: 8.5 mL sterile water

NovoSeven® RT: Reconstitute each vial to a final concentration of 1 mg/mL using the provided histidine diluent as follows:

1 mg vial: 1.1 mL sterile water

2 mg vial: 2.1 mL sterile water

5 mg vial: 5.2 mL sterile water

ContraindicationsThere are no contraindications listed within the FDA-approved labeling.

Warnings/Precautions

Concerns related to adverse effects:

- Hypersensitivity reactions: Use with caution in patients with known hypersensitivity to mouse, hamster, or bovine proteins, or factor VIIa, or any components of the product.

- Thrombotic events: Patients should be monitored for signs and symptoms of activation of the coagulation system or thrombosis; thrombotic events may be increased in patients with disseminated intravascular coagulation (DIC), advanced atherosclerotic disease, sepsis, crush injury, or concomitant treatment with prothrombin complex concentrates. Decreased dosage or discontinuation is warranted in confirmed DIC.

Other warnings/precautions:

- Long-term use: Efficacy with prolonged infusions and data evaluating this agent's long-term adverse effects are limited.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal studies have demonstrated fetal loss, but no evidence of teratogenic effects. There are no adequate and well-controlled studies in pregnant women. Use only if the potential benefit justifies the potential risk to the fetus.

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

1% to 10%:

Cardiovascular: Hypertension

Central nervous system: Fever

Hematologic: Hemorrhage, plasma fibrinogen decreased

Neuromuscular & skeletal: Hemarthrosis

<1%: Abnormal renal function, allergic reactions, arthrosis, bradycardia, coagulation disorder, disseminated intravascular coagulation (DIC), edema, fibrinolysis increased, gastrointestinal bleeding, headache, hypotension, injection site reactions, intracranial hemorrhage, localized phlebitis, pain, pneumonia, prothrombin decreased, pruritus, purpura, rash, splenic hematoma, therapeutic response decreased, thrombosis, vomiting

Postmarketing and/or case reports: Anaphylactic reaction, arterial thrombosis, cerebral infarction and/or ischemia, consumptive coagulopathy, deep vein thrombosis, hypersensitivity, MI, myocardial ischemia, pulmonary embolism, thrombophlebitis

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersMonitor for evidence of hemostasis; although the prothrombin time, aPTT, and factor VII clotting activity have no correlation with achieving hemostasis, these parameters may be useful as adjunct tests to evaluate efficacy and guide dose or interval adjustments

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents or herbal products the patient may be taking that may affect coagulation or platelet function. Assess results of laboratory tests (eg, prothrombin time and factor VII clotting activity). Patient should be monitored closely during and after therapy (vital signs, cardiac and CNS status, hemolytic status, hypersensitivity). Provide patient education according to patient condition.

Monitoring: Lab TestsAlthough the prothrombin time, aPTT, and factor VII clotting activity have no correlation with achieving hemostasis, these parameters may be useful as adjunct tests to evaluate efficacy and guide dose or interval adjustments

Patient EducationThis medication can only be administered by infusion. Report immediately any swelling, pain, burning, or itching at infusion site. Report acute headache, visual changes, pain in joints or muscles, respiratory difficulty, chills, back pain, dizziness, nausea, or other unusual effects. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Injection, powder for reconstitution [preservative free]:

NovoSeven®: 1.2 mg, 2.4 mg, 4.8 mg [contains sodium 0.44 mEq/mg rFVIIa, polysorbate 80] [DSC]

NovoSeven® RT:

1 mg [contains polysorbate 80, sodium 0.4 mEq/mg rFVIIa, sucrose 10 mg/vial]

2 mg [contains polysorbate 80, sodium 0.4 mEq/mg rFVIIa, sucrose 20 mg/vial]

5 mg [contains polysorbate 80, sodium 0.4 mEq/mg rFVIIa, sucrose 50 mg/vial]

Generic AvailableNo

ManufacturerNovo Nordisk®

Mechanism of ActionRecombinant factor VIIa, a vitamin K-dependent glycoprotein, promotes hemostasis by activating the extrinsic pathway of the coagulation cascade. It replaces deficient activated coagulation factor VII, which complexes with tissue factor and may activate coagulation factor X to Xa and factor IX to IXa. When complexed with other factors, coagulation factor Xa converts prothrombin to thrombin, a key step in the formation of a fibrin-platelet hemostatic plug.

Pharmacodynamics/Kinetics

Distribution: V_d: 103 mL/kg (78-139)

Half-life elimination: 2.3 hours (1.7-2.7)

Excretion: Clearance: 33 mL/kg/hour (27-49)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Anesthesia and Critical Care Concerns/Other ConsiderationsA number of patient-specific factors may influence the potential efficacy of factor VIIa including hypothermia, thrombocytopenia, acidic arterial pH, and the amount of blood products transfused prior to administration. Factor VIIa exerts its mechanism of action at the site of vascular injury where tissue factor is expressed and activated platelets are found. Factor VIIa binds directly to the surface of activated platelets and activates factor X to Xa and generates thrombin as a result. Adequate platelets may be required for factor VIIa to properly induce coagulation.

Management of Intracerebral Hemorrhage (ICH): Rapid identification of patients experiencing ICH is essential and should be considered a medical emergency due to the progressive deterioration, severe clinical deficits, and high mortality and morbidity. Treatment for ICH has evolved rapidly in recent years. According to the 2007 ACC/AHA Guidelines for the Management of Spontaneous Intracerebral Hemorrhage in Adults, patients with ICH should be treated in a balanced and graded approach with therapies that reduce intracranial pressure (ICP) (eg, mannitol, hypertonic saline solutions, barbiturate coma, head of bed elevation) (Class IIa recommendation). Direct monitoring of ICP and central perfusion pressure (CPP) may be necessary if patient is treated more aggressively. Treatment of ICH with recombinant factor VIIa (rFVIIa) within the first 3-4 hours after onset to slow progression of bleeding has shown promise; however, at this time it cannot be routinely recommended in all patients experiencing ICH (Class IIb recommendation).

Management of Warfarin-Related ICH: Overall management of ICH is similar regardless of cause; however, iatrogenic spontaneous ICH may have specific treatments. According to the 2007 ACC/ASA Guidelines for the Management of Spontaneous Intracerebral Hemorrhage, warfarin-related ICH should be treated with I.V. vitamin K at a dose of 10 mg given slowly (not to exceed 1 mg/minute) (Class I recommendation). It is important to also administer fresh frozen plasma (FFP) since vitamin K may take several hours to normalize INR. Other options besides FFP include prothrombin complex concentrate (PCC) which contains high levels of vitamin K-dependent factors (II, VII, and X) and factor IX complex which contains factors II, VII, IX, and X (Class IIb recommendation). Use of rFVIIa has shown promise for this indication. Advantages to rFVIIa include faster onset of action compared to FFP and vitamin K and a 50% lower volume is required compared to FFP. Disadvantages include a short half-life (~2.6 hours) requiring multiple doses to maintain a normalized INR and an increased risk of thromboembolic complications. Dosing of rFVIIa ranges between 15-90 mcg/kg. The use of factor-containing products has a risk of thromboembolism.

Index TermsCoagulation Factor VIIa; Eptacog Alfa (Activated); rFVIIa

Pharmacologic Category Chemotherapy Regimen, Gastric Cancer; Chemotherapy Regimen, Pancreatic Cancer

Regimen Use Gastric cancer; Pancreatic cancer

Regimen NOTE: Multiple variations are listed below

Variation 1:

Fluorouracil: I.V.: 600 mg/m^2/day days 1, 8, 29, and 36

[total dose/cycle = 2400 mg/m^2]

Doxorubicin: I.V.: 30 mg/m^2/day days 1 and 29

[total dose/cycle = 60 mg/m^2]

Mitomycin: I.V.: 10 mg/m^2 day 1

[total dose/cycle = 10 mg/m^2]

Repeat cycle every 8 weeks

Variation 2:

Fluorouracil: I.V.: 600 mg/m^2/day days 29 to 32

[total dose/cycle = 2400 mg/m^2]

Doxorubicin: I.V.: 50 mg/m^2 day 1

[total dose/cycle = 50 mg/m^2]

Mitomycin: I.V.: 10 mg/m^2 day 3

[total dose/cycle = 10 mg/m^2]

Repeat cycle every 8 weeks

Variation 3:

Fluorouracil: I.V.: 500 mg/m^2/day days 1, 8, 21, and 28

[total dose/cycle = 2000 mg/m^2]

Doxorubicin: I.V.: 30 mg/m^2/day days 1 and 21

[total dose/cycle = 60 mg/m^2]

Mitomycin: I.V.: 10 mg/m^2 day 1

[total dose/cycle = 10 mg/m^2]

Repeat cycle every 6 weeks

Variation 4:

Fluorouracil: I.V.: 275 mg/m^2/day days 1 to 5 and 36 to 40

[total dose/cycle = 2750 mg/m^2]

Doxorubicin: I.V.: 30 mg/m^2/day days 1 and 36

[total dose/cycle = 60 mg/m^2]

Mitomycin: I.V.: 10 mg/m^2 day 1

[total dose/cycle = 10 mg/m^2]

Repeat cycle every 10 weeks

Variation 5:

Fluorouracil: I.V.: 600 mg/m^2/day days 1, 8, 22, and 29

[total dose/cycle = 2400 mg/m^2]

Doxorubicin: I.V.: 30 mg/m^2/day days 1 and 22

[total dose/cycle = 60 mg/m^2]

Mitomycin: I.V.: 10 mg/m^2 day 1

[total dose/cycle = 10 mg/m^2]

Repeat cycle every 6 weeks

Medication Safety Issues

Sound-alike/look-alike issues:

Famvir® may be confused with Femara®

Pronunciation(fam SYE kloe veer)
U.S. Brand NamesFamvir®
Canadian Brand NamesApo-Famciclovir; Famvir®; PMS-Famciclovir; Sandoz-Famciclovir
Pharmacologic CategoryAntiviral Agent
Use: Labeled IndicationsTreatment of acute herpes zoster (shingles); treatment and suppression of recurrent episodes of genital herpes in immunocompetent patients; treatment of herpes labialis (cold sores) in immunocompetent patients; treatment of recurrent mucocutaneous/genital herpes simplex in HIV-infected patients
Use: DentalManagement of acute herpes zoster (shingles); treatment of recurrent herpes labialis in immunocompetent patients
Dosing: Adults

Acute herpes zoster: Oral: 500 mg every 8 hours for 7 days (**Note:** Initiate therapy within 72 hours of rash onset.)

Recurrent genital herpes simplex in immunocompetent patients: Oral:

Initial: 1000 mg twice daily for 1 day (**Note:** initiate therapy within 6 hours of symptoms/lesions.)

Suppressive therapy: 250 mg twice daily for up to 1 year

Recurrent herpes labialis (cold sores): Oral: 1500 mg as a single dose; initiate therapy at first sign or symptom such as tingling, burning, or itching (initiated within 1 hour in clinical studies)

Recurrent mucocutaneous/genital herpes simplex in HIV patients: Oral: 500 mg twice daily for 7 days

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal Impairment

Herpes zoster:

Cl_{cr} 40-59 mL/minute: Administer 500 mg every 12 hours

Cl_{cr} 20-39 mL/minute: Administer 500 mg every 24 hours

Cl_{cr} <20 mL/minute: Administer 250 mg every 24 hours

Hemodialysis: Administer 250 mg after each dialysis session.

Recurrent genital herpes: Treatment (single day regimen):

Cl_{cr} 40-59 mL/minute: Administer 500 mg every 12 hours for 1 day

Cl_{cr} 20-39 mL/minute: Administer 500 mg as a single dose

Cl_{cr} <20 mL/minute: Administer 250 mg as a single dose

Hemodialysis: Administer 250 mg as a single dose after dialysis session.

Recurrent genital herpes: Suppression:

Cl_{cr} 20-39 mL/minute: Administer 125 mg every 12 hours

Cl_{cr} <20 mL/minute: Administer 125 mg every 24 hours

Hemodialysis: Administer 125 mg after each dialysis session.

Recurrent herpes labialis: Treatment (single dose regimen):

Cl_{cr} 40-59 mL/minute: Administer 750 mg as a single dose

Cl_{cr} 20-39 mL/minute: Administer 500 mg as a single dose

Cl_{cr} <20 mL/minute: Administer 250 mg as a single dose

Hemodialysis: Administer 250 mg as a single dose after dialysis session.

Recurrent orolabial or genital herpes in HIV-infected patients:

Cl_{cr} 20-39 mL/minute: Administer 500 mg every 12 hours

Cl_{cr} <20 mL/minute: Administer 250 mg every 24 hours

Hemodialysis: Administer 250 mg after each dialysis session.

Calculations

- Creatinine Clearance: Adults

Dietary ConsiderationsMay be taken with food or on an empty stomach.
StorageStore at controlled room temperature.
ContraindicationsHypersensitivity to famciclovir, penciclovir, or any component of the formulation
Allergy Considerations

- Antiviral Acyclic Guanine Derivative Allergy

Warnings/Precautions

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment required.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Lactose: Tablets contain lactose; do not use with galactose intolerance, severe lactase deficiency, or glucose-galactose malabsorption syndromes.

Other warnings/precautions:

- Appropriate use: Has not been established for use in initial episodes of genital herpes, patients with ophthalmic or disseminated zoster, or in immunocompromised patients with herpes zoster.

Geriatric ConsiderationsFor herpes zoster (shingles) infections, famciclovir should be started within 72 hours of the appearance of the rash to be effective. Famciclovir has been shown to accelerate healing, reduce the duration of viral shedding, and resolve posthepatic neuralgia faster than placebo. Comparison trials to acyclovir or valacyclovir are not available. Adjust dose for estimated renal function.
Pregnancy Risk FactorB
Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women. Use only if benefit outweighs risk. A registry has been established for women exposed to famciclovir during pregnancy (888-669-6682).
LactationExcretion in breast milk unknown/use caution
Breast-Feeding ConsiderationsThere is no specific data describing the excretion of famciclovir in breast milk. If herpes lesions are on breast, breast-feeding should be avoided in order to avoid transmission to infant.
Adverse Reactions

Note: Frequencies vary with dose and duration. Single-dose treatment (herpes labialis) was associated only with headache (10%), diarrhea (2%), fatigue (1%), and dysmenorrhea (1%).

>10%:

Central nervous system: Headache (17% to 39%)

Gastrointestinal: Nausea (7% to 13%)

1% to 10%:

Central nervous system: Fatigue (4% to 6%), migraine (1% to 3%)

Dermatologic: Pruritus (1% to 4%), rash (<1% to 3%)

Endocrine & metabolic: Dysmenorrhea (up to 8%)

Gastrointestinal: Diarrhea (5% to 9%), flatulence (2% to 5%), vomiting (1% to 5%), abdominal pain (1% to 8%)

Hematologic: Neutropenia (3%), leukopenia (1%)

Hepatic: Transaminases increased (2% to 3%), bilirubin increased (2%)

Neuromuscular & skeletal: Paresthesia (1% to 3%)

Postmarketing and/or case reports: Confusion, delirium, disorientation, dizziness, erythema multiforme, hallucinations, jaundice, somnolence, thrombocytopenia, urticaria

Drug Interactions

Zoster Vaccine: Famciclovir may diminish the therapeutic effect of Zoster Vaccine. Management: When possible, discontinue antiviral agents with anti-zoster activity (i.e., acyclovir, valacyclovir, famciclovir) for at least 24 hours prior to and 14 days after receiving a live attenuated zoster vaccine. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsFood: Rate of absorption and/or conversion to penciclovir and peak concentration are reduced with food, but bioavailability is not affected.

Monitoring ParametersPeriodic CBC during long-term therapy

Nursing: Physical Assessment/MonitoringAssess periodic CBC during long-term therapy. Assess potential for interactions with other pharmacological agents the patient may be taking. Assess results of laboratory tests, therapeutic effectiveness according to purpose for use, and adverse response (eg, persistent fatigue, gastrointestinal upset). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsPeriodic CBC during long-term therapy

Patient EducationTake for prescribed length of time, even if condition improves. Do not discontinue without consulting prescriber. This is not a cure for genital herpes. May cause mild GI disturbances (eg, nausea, vomiting, constipation, diarrhea), fatigue, headache, or muscle aches and pains. If these are severe, contact prescriber. **Breast-feeding precaution:** Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 125 mg, 250 mg, 500 mg

Famvir®: 125 mg, 250 mg, 500 mg

Generic AvailableYes

ManufacturerSmithKline Beecham Pharmaceuticals

Pricing: U.S. (www.drugstore.com)

Tablets (Famciclovir)

125 mg (30): $89.99

250 mg (30): $99.99

500 mg (30): $199.98

Tablets (Famvir)

125 mg (30): $153.34

250 mg (30): $165.98

500 mg (30): $304.54

Mechanism of ActionFamciclovir undergoes rapid biotransformation to the active compound, penciclovir, which is phosphorylated by viral thymidine kinase in HSV-1, HSV-2, and VZV-infected cells to a monophosphate form; this is then converted to penciclovir triphosphate and competes with deoxyguanosine triphosphate to inhibit HSV-2 polymerase (eg, herpes viral DNA synthesis/replication is selectively inhibited)

Pharmacodynamics/Kinetics

Absorption: Food decreases maximum peak concentration and delays time to peak; AUC remains the same

Distribution: V_{dss}: 0.91-1.25 L/kg

Protein binding: ≤20%

Metabolism: Rapidly deacetylated and oxidized to penciclovir; not via CYP

Bioavailability: 69% to 85%

Half-life elimination: Penciclovir: 2-3 hours (10, 20, and 7 hours in HSV-1, HSV-2, and VZV-infected cells, respectively); prolonged with renal impairment

Time to peak: 0.9 hours; C_{max} and T_{max} are decreased and prolonged with noncompensated hepatic impairment

Excretion: Urine (73% primarily as penciclovir); feces (27%)

Related Information

- Treatment of Sexually-Transmitted Infections

Pharmacotherapy PearlsMost effective for herpes zoster if therapy is initiated within 48 hours of initial lesion. Resistance may occur by alteration of thymidine kinase, resulting in loss of or reduced penciclovir phosphorylation (cross-resistance occurs between acyclovir and famciclovir). When treatment for herpes labialis is initiated within 1 hour of symptom onset, healing time is reduced by ~2 days.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause sedation

Mental Health: Effects on Psychiatric TreatmentNone reported

Pronunciation(fa MOE ti deen, KAL see um KAR bun ate, & mag NEE zhum hye DROKS ide)

U.S. Brand NamesPepcid® Complete [OTC]

Canadian Brand NamesPepcid® Complete [OTC]

Pharmacologic CategoryAntacid; Histamine H$_2$ Antagonist

Use: Labeled IndicationsRelief of heartburn due to acid indigestion

Dosing: AdultsRelief of heartburn due to acid indigestion: Oral: Pepcid® Complete: 1 tablet as needed; no more than 2 tablets in 24 hours; do **not** swallow whole, chew tablet completely before swallowing; do not use for longer than 14 days (see Additional Information for dosing ranges for individual ingredients)

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricChildren ≥12 years: Refer to adult dosing.

StorageStore at 25°C to 30°C (77°F to 86°F). Protect from moisture.

ContraindicationsHypersensitivity to famotidine or other H$_2$ antagonists, calcium carbonate, magnesium hydroxide, or any component of the formulation. See individual agents for additional information.

Allergy Considerations

- Histamine H$_2$ Antagonist Allergy

Warnings/PrecautionsSee individual agents.

Geriatric ConsiderationsUse with caution in the elderly with reduced renal function (Cl$_{cr}$ <30 mL/minute), since accumulation of magnesium and famotidine may occur and potentiate side effects

Adverse ReactionsSee individual agents.

Drug Interactions

ACE Inhibitors: Antacids may decrease the serum concentration of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: Antacids may decrease the absorption of Allopurinol. *Risk D: Consider therapy modification*

Alpha-/Beta-Agonists: Antacids may decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Dipivefrin. *Risk C: Monitor therapy*

Amphetamines: Antacids may decrease the excretion of Amphetamines. *Risk C: Monitor therapy*

Anticonvulsants (Hydantoin): Antacids may decrease the serum concentration of Anticonvulsants (Hydantoin). *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): Antacids may decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). **Exceptions:** Miconazole. *Risk D: Consider therapy modification*

Antifungal Agents (Azole Derivatives, Systemic): H2-Antagonists may decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). **Exceptions:** Miconazole; Voriconazole. *Risk D: Consider therapy modification*

Antipsychotic Agents (Phenothiazines): Antacids may decrease the absorption of Antipsychotic Agents (Phenothiazines). *Risk C: Monitor therapy*

Atazanavir: Antacids may decrease the absorption of Atazanavir. *Risk D: Consider therapy modification*

Atazanavir: H2-Antagonists may decrease the absorption of Atazanavir. *Risk D: Consider therapy modification*

Bisacodyl: Antacids may diminish the therapeutic effect of Bisacodyl. Antacids may cause the delayed-release bisacodyl tablets to release drug prior to reaching the large intestine. Gastric irritation and/or cramps may occur. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Calcium Salts may decrease the absorption of Bisphosphonate Derivatives. **Exceptions:** Pamidronate; Zoledronic Acid. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Antacids may decrease the absorption of Bisphosphonate Derivatives. Antacids containing aluminum, calcium, or magnesium are of specific concern. **Exceptions:** Pamidronate; Zoledronic Acid. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Magnesium Salts may decrease the absorption of Bisphosphonate Derivatives. Only oral magnesium salts are of concern. **Exceptions:** Pamidronate; Zoledronic Acid. *Risk D: Consider therapy modification*

Calcitriol: May increase the serum concentration of Magnesium Salts. *Risk D: Consider therapy modification*

Calcium Channel Blockers: Calcium Salts may diminish the therapeutic effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Calcium Channel Blockers: May enhance the adverse/toxic effect of Magnesium Salts. Magnesium Salts may enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Cefpodoxime: H2-Antagonists may decrease the absorption of Cefpodoxime. Separate oral doses by at least 2 hours. *Risk C: Monitor therapy*

Cefpodoxime: Antacids may decrease the serum concentration of Cefpodoxime. *Risk C: Monitor therapy*

Cefuroxime: H2-Antagonists may decrease the absorption of Cefuroxime. Separate oral doses by at least 2 hours. *Risk C: Monitor therapy*

Cefuroxime: Antacids may decrease the serum concentration of Cefuroxime. *Risk C: Monitor therapy*

Corticosteroids (Oral): Antacids may decrease the bioavailability of Corticosteroids (Oral). *Risk D: Consider therapy modification*

CycloSPORINE: Antacids may decrease the serum concentration of CycloSPORINE. Specifically when cyclosporine is administered orally. *Risk C: Monitor therapy*

Dabigatran Etexilate: Antacids may decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

Dasatinib: Antacids may decrease the absorption of Dasatinib. *Risk D: Consider therapy modification*

Dasatinib: H2-Antagonists may decrease the absorption of Dasatinib. *Risk D: Consider therapy modification*

Delavirdine: Antacids may decrease the absorption of Delavirdine. *Risk D: Consider therapy modification*

DOBUTamine: Calcium Salts may diminish the therapeutic effect of DOBUTamine. *Risk C: Monitor therapy*

Erlotinib: H2-Antagonists may decrease the serum concentration of Erlotinib. *Risk X: Avoid combination*

Erlotinib: Antacids may decrease the serum concentration of Erlotinib. Management: Separate the administration of erlotinib and any antacid by several hours in order to minimize the risk of a significant interaction. *Risk D: Consider therapy modification*

Estramustine: Calcium Salts may decrease the absorption of Estramustine. *Risk D: Consider therapy modification*

Fexofenadine: Antacids may decrease the serum concentration of Fexofenadine. Management: No specific recommendations concerning the time required between their administration are provided. Separate administration of each agent by as much time as possible to decrease the risk of an interaction. *Risk D: Consider therapy modification*

Fosamprenavir: H2-Antagonists may decrease the serum concentration of Fosamprenavir. Cimetidine may also inhibit the metabolism of the active metabolite amprenavir, making its effects on fosamprenavir/amprenavir concentrations difficult to predict. *Risk C: Monitor therapy*

Iron Salts: Antacids may decrease the absorption of Iron Salts. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk D: Consider therapy modification*

Iron Salts: H2-Antagonists may decrease the absorption of Iron Salts. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk C: Monitor therapy*

Isoniazid: Antacids may decrease the absorption of Isoniazid. *Risk D: Consider therapy modification*

Methenamine: Antacids may diminish the therapeutic effect of Methenamine. *Risk D: Consider therapy modification*

Mycophenolate: Antacids may decrease the absorption of Mycophenolate. *Risk D: Consider therapy modification*

Mycophenolate: Magnesium Salts may decrease the absorption of Mycophenolate. This only applies to oral magnesium salts. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents: Magnesium Salts may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. Only of concern in patients with increased serum magnesium concentrations. *Risk C: Monitor therapy*

Penicillamine: Antacids may decrease the serum concentration of Penicillamine. *Risk D: Consider therapy modification*

Phosphate Supplements: Antacids may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Phosphate Supplements: Calcium Salts may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Phosphate Supplements: Magnesium Salts may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Protease Inhibitors: Antacids may decrease the absorption of Protease Inhibitors. **Exceptions:** Darunavir. *Risk C: Monitor therapy*

QuiNIDine: Antacids may decrease the excretion of QuiNIDine. *Risk C: Monitor therapy*

Quinolone Antibiotics: Antacids may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. *Risk D: Consider therapy modification*

Quinolone Antibiotics: Calcium Salts may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. **Exceptions:** Moxifloxacin. *Risk D: Consider therapy modification*

Quinolone Antibiotics: Magnesium Salts may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. *Risk D: Consider therapy modification*

Saquinavir: H2-Antagonists may increase the serum concentration of Saquinavir. *Risk C: Monitor therapy*

Sodium Polystyrene Sulfonate: May enhance the adverse/toxic effect of Antacids. The combined use of these two agents may result in metabolic alkalosis. *Risk D: Consider therapy modification*

Tetracycline Derivatives: Antacids may decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Tetracycline Derivatives: Magnesium Salts may decrease the absorption of Tetracycline Derivatives. Only applicable to oral preparations of each agent. *Risk D: Consider therapy modification*

Thiazide Diuretics: May decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Tocainide: Antacids may increase the serum concentration of Tocainide. *Risk C: Monitor therapy*

Trientine: Antacids may decrease the absorption of Trientine. *Risk D: Consider therapy modification*

Trientine: Calcium Salts may decrease the serum concentration of Trientine. Trientine may decrease the serum concentration of Calcium Salts. *Risk D: Consider therapy modification*

Trientine: May decrease the serum concentration of Magnesium Salts. Magnesium Salts may decrease the serum concentration of Trientine. *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, chewable: Famotidine 10 mg, calcium carbonate 800 mg, and magnesium hydroxide 165 mg [berry blend and mint flavors]

Generic AvailableNo

Mechanism of Action

Famotidine: H_2 antagonist

Calcium carbonate: Antacid

Magnesium hydroxide: Antacid

Pharmacodynamics/KineticsSee individual agents.

Pharmacotherapy PearlsPresented in dosage field is the specific OTC labeling for the indicated product. Dosing ranges of the individual ingredients include:

Adults:

Famotidine: Duodenal/gastric ulcer: 40 mg/day at bedtime

Calcium carbonate: Antacid: ≤3 g/day of elemental calcium

Magnesium hydroxide: Antacid: Approximately ≤5 g/day of magnesium hydroxide

Healthcare providers should also refer to the individual monographs for more specific information.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness or drowsiness; may rarely cause insomnia

Mental Health: Effects on Psychiatric TreatmentMay cause agranulocytosis; use caution with clozapine and carbamazepine

Index TermsCalcium Carbonate, Magnesium Hydroxide, and Famotidine; Magnesium Hydroxide, Famotidine, and Calcium Carbonate

International Brand NamesMegalex Antiacido (AR); Pepcid Duo (SE); Pepcidduo (FI, FR, NO); Promag Double Action (ID)

Famotidine

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(fa MOE ti deen)

U.S. Brand NamesPepcid®; Pepcid® AC Maximum Strength [OTC]; Pepcid® AC [OTC]

Canadian Brand NamesApo-Famotidine®; Apo-Famotidine® Injectable; Famotidine Omega; Gen-Famotidine; Novo-Famotidine; Nu-Famotidine; Pepcid®; Pepcid® AC; Pepcid® I.V.; ratio-Famotidine; Riva-Famotidine; Ulcidine

Pharmacologic CategoryHistamine H_2 Antagonist

Use: Labeled IndicationsMaintenance therapy and treatment of duodenal ulcer; treatment of gastroesophageal reflux, active benign gastric ulcer, and pathological hypersecretory conditions

OTC labeling: Relief of heartburn, acid indigestion, and sour stomach

Use: Unlabeled/InvestigationalPart of a multidrug regimen for *H. pylori* eradication to reduce the risk of duodenal ulcer recurrence; stress ulcer prophylaxis in critically-ill patients; symptomatic relief in gastritis

Dosing: Adults

Duodenal ulcer: Oral: Acute therapy: 40 mg/day at bedtime for 4-8 weeks; maintenance therapy: 20 mg/day at bedtime

Gastric ulcer: Oral: Acute therapy: 40 mg/day at bedtime

Hypersecretory conditions: Oral: Initial: 20 mg every 6 hours, may increase in increments up to 160 mg every 6 hours

GERD: Oral: 20 mg twice daily for 6 weeks

Esophagitis and accompanying symptoms due to GERD: Oral: 20 mg or 40 mg twice daily for up to 12 weeks

Peptic ulcer disease: Eradication of*Helicobacter pylori*(unlabeled use): Oral: 40 mg once daily; requires combination therapy with antibiotics

Patients unable to take oral medication: I.V.: 20 mg every 12 hours

Heartburn, indigestion, sour stomach: OTC labeling: Oral: 10-20 mg every 12 hours; dose may be taken 15-60 minutes before eating foods known to cause heartburn

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricTreatment duration and dose should be individualized

Peptic ulcer: 1-16 years:

Oral: 0.5 mg/kg/day at bedtime or divided twice daily (maximum dose: 40 mg/day); doses of up to 1 mg/kg/day have been used in clinical studies

I.V.: 0.25 mg/kg every 12 hours (maximum dose: 40 mg/day); doses of up to 0.5 mg/kg have been used in clinical studies

GERD: Oral:

<3 months: 0.5 mg/kg once daily

3-12 months: 0.5 mg/kg twice daily

1-16 years: 1 mg/kg/day divided twice daily (maximum dose: 40 mg twice daily); doses of up to 2 mg/kg/day have been used in clinical studies

Heartburn, indigestion, sour stomach: OTC labeling: Oral: Children ≥12 years: Refer to adult dosing.

Dosing: Renal ImpairmentCl_{cr} <50 mL/minute: Manufacturer recommendation: Administer 50% of dose **or** increase the dosing interval to every 36-48 hours (to limit potential CNS adverse effects).

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.

I.V. push: Inject over at least 2 minutes.

Solution for infusion: Administer over 15-30 minutes.

Administration: I.V. DetailpH: 5.7-6.4 (premixed solution); 5.0-5.6 (injection)

Administration: Oral

Suspension: Shake vigorously before use. May be taken with or without food.

Tablet: May be taken with or without food.

Storage

Oral:

Powder for oral suspension: Prior to mixing, dry powder should be stored at controlled room temperature of 25°C (77°F). Reconstituted oral suspension is stable for 30 days at room temperature; do not freeze.

Tablet: Store controlled room temperature. Protect from moisture.

I.V.:

Solution for injection: Prior to use, store at 2°C to 8°C (36°F to 46°F). If solution freezes, allow to solubilize at controlled room temperature.

I.V. push: Following preparation, solutions for I.V. push should be used immediately, or may be stored in refrigerator and used within 48 hours.

Infusion: Following preparation, the manufacturer states may be stored for up to 48 hours under refrigeration; however, solutions for infusion have been found to be physically and chemically stable for 7 days at room temperature.

Solution for injection, premixed bags: Store at controlled room temperature of 25°C (77°F). Avoid excessive heat.

Reconstitution

Solution for injection:

I.V. push: Dilute famotidine with NS (or another compatible solution) to a total of 5-10 mL (some centers also administer undiluted).

Infusion: Dilute with D_5W 100 mL or another compatible solution.

Compatibility

Stable in D_5W, $D_{10}W$, LR, fat emulsion 10%, NS, sodium bicarbonate 5%; **variable stability (consult detailed reference)** in TPN.

Y-site administration: Compatible: Acyclovir, allopurinol, amifostine, aminophylline, ampicillin, ampicillin/sulbactam, amsacrine, atropine, aztreonam, calcium gluconate, cefazolin, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chlorpromazine, cisatracurium, cisplatin, cladribine, cyclophosphamide, cytarabine, dexamethasone sodium phosphate, dextran 40, digoxin, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxorubicin liposome, droperidol, enalaprilat, epinephrine, erythromycin lactobionate, esmolol, etoposide, filgrastim, fluconazole, fludarabine, folic acid, gatifloxacin, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, hydrocortisone sodium succinate, hydromorphone, hydroxyzine, imipenem/cilastatin, inamrinone, insulin (regular), isoproterenol, labetalol, lidocaine, linezolid, lorazepam, magnesium sulfate, melphalan, meperidine, methotrexate, methylprednisolone sodium succinate, metoclopramide, midazolam, morphine, nafcillin, nitroglycerin, norepinephrine, ondansetron, oxacillin, paclitaxel, perphenazine, phenylephrine, phenytoin, phytonadione, piperacillin, potassium chloride, potassium phosphates, procainamide, propofol, remifentanil, sargramostim, sodium bicarbonate, sodium nitroprusside, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin/clavulanate potassium, tirofiban, verapamil, vinorelbine. **Incompatible:** Amphotericin B cholesteryl sulfate complex, cefepime, piperacillin/tazobactam. **Variable (consult detailed reference):** Furosemide, TPN.

Compatibility when admixed: Compatible: Cefazolin, flumazenil, vancomycin.

Contraindications

Hypersensitivity to famotidine, other H_2 antagonists, or any component of the formulation

Allergy Considerations

- Histamine H_2 Antagonist Allergy

Warnings/Precautions

Concerns related to adverse effects.

- Confusion: Reversible confusional states, usually clearing within 3-4 days after discontinuation, have been linked to use. Increased age (>50 years) and renal or hepatic impairment are thought to be associated.

Disease-related concerns:

- Gastric malignancy: Relief of symptoms does not preclude the presence of a gastric malignancy.

- Renal impairment: Use with caution in patients with moderate-to-severe renal impairment (Cl_{cr} <50 mL/minute); dosage adjustment recommended.

Dosage form specific issues:

- Benzyl alcohol: Multidose vials for injection contain benzyl alcohol which has been associated with "gasping syndrome" in neonates.

Other warnings/precautions:

- OTC labeling: When used for self-medication, patients should be instructed not to use if they have difficulty swallowing, are vomiting blood, or have bloody or black stools. Not for use with other acid reducers.

Geriatric Considerations

H_2 blockers are the preferred drugs for treating PUD in the elderly due to cost and ease of administration. They are no less or more effective than any other therapy. Famotidine is one of the preferred agents (due to side effects, drug interaction profile, and pharmacokinetics). Treatment for PUD in the elderly is recommended for 12 weeks since their lesions are typically larger; therefore, take longer to heal. Always adjust dose based upon creatinine clearance, since slight accumulation may result in CNS side effects, mainly confusion.

Pregnancy Risk FactorB

Pregnancy ConsiderationsCrosses the placenta. There are no adequate and well-controlled studies in pregnant women. Use only if clearly needed.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsFamotidine is concentrated in breast milk, but to a lesser degree than cimetidine or ranitidine; some sources prefer its use if one of these agents is needed.

Adverse Reactions

Note: Agitation and vomiting have been reported in up to 14% of pediatric patients <1 year of age.

1% to 10%:

Central nervous system: Headache (5%), dizziness (1%)

Gastrointestinal: Diarrhea (2%), constipation (1%)

<1% (Limited to important or life-threatening): Abdominal discomfort, acne, agitation, agranulocytosis, allergic reaction, alopecia, anaphylaxis, angioedema, anorexia, anxiety, arrhythmia, arthralgia, AV block, bradycardia, bronchospasm, BUN/creatinine increased, cholestatic jaundice, confusion, decreased libido, depression, drowsiness, facial edema, fatigue, fever, flushing, hallucinations, injection site reactions, insomnia, interstitial pneumonia, jaundice, nausea, leukopenia, liver function tests increased, muscle cramps, palpitation, pancytopenia, paresthesia, proteinuria, pruritus, rash, seizure, somnolence, Stevens-Johnson syndrome, tinnitus, thrombocytopenia, toxic epidermal necrolysis, urticaria, vomiting, weakness, xerostomia

Drug Interactions

Antifungal Agents (Azole Derivatives, Systemic): H2-Antagonists may decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). **Exceptions:** Miconazole; Voriconazole. *Risk D: Consider therapy modification*

Atazanavir: H2-Antagonists may decrease the absorption of Atazanavir. *Risk D: Consider therapy modification*

Cefpodoxime: H2-Antagonists may decrease the absorption of Cefpodoxime. Separate oral doses by at least 2 hours. *Risk C: Monitor therapy*

Cefuroxime: H2-Antagonists may decrease the absorption of Cefuroxime. Separate oral doses by at least 2 hours. *Risk C: Monitor therapy*

Dasatinib: H2-Antagonists may decrease the absorption of Dasatinib. *Risk D: Consider therapy modification*

Erlotinib: H2-Antagonists may decrease the serum concentration of Erlotinib. *Risk X: Avoid combination*

Fosamprenavir: H2-Antagonists may decrease the serum concentration of Fosamprenavir. Cimetidine may also inhibit the metabolism of the active metabolite amprenavir, making its effects on fosamprenavir/amprenavir concentrations difficult to predict. *Risk C: Monitor therapy*

Iron Salts: H2-Antagonists may decrease the absorption of Iron Salts. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk C: Monitor therapy*

Saquinavir: H2-Antagonists may increase the serum concentration of Saquinavir. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may cause gastric mucosal irritation).

Food: Famotidine bioavailability may be increased if taken with food.

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other medications patient may be taking (eg, anything that may affect neuromuscular transmission). Evaluate patient response on a regular basis throughout therapy. I.V.: See Administration specifics. Teach patient proper use (eg, timing of administration when used concurrently with other medications), possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber. Take exactly as directed; do not alter dose or frequency. OTC: Follow package instructions; do not use for more than 14 days unless recommended by prescriber. May cause drowsiness or dizziness (use caution when driving or engaging in tasks that require alertness until response to drug is known); constipation (increased exercise, fluids, fruit, or fiber may help); or diarrhea (buttermilk, boiled milk, or yogurt may help). Report acute headache, unresolved constipation or diarrhea, palpitations, black tarry stools, abdominal pain, rash, worsening of condition being treated, or recurrence of symptoms after therapy is completed. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Gelcap:

Pepcid® AC: 10 mg

Infusion [premixed in NS]: 20 mg (50 mL)

Pepcid®: 20 mg (50 mL)

Injection, solution: 10 mg/mL (4 mL, 20 mL, 50 mL)

Pepcid®: 10 mg/mL (20 mL) [contains benzyl alcohol]

Injection, solution [preservative free]: 10 mg/mL (2 mL)

Pepcid®: 10 mg/mL (2 mL)

Powder for oral suspension:

Pepcid®: 40 mg/5 mL (50 mL) [contains sodium benzoate; cherry-banana-mint flavor]

Tablet: 10 mg [OTC], 20 mg, 40 mg

Pepcid®: 20 mg, 40 mg

Pepcid® AC: 10 mg, 20 mg

Pepcid® AC Maximum Strength: 20 mg

Generic Available Yes: Injection, tablet

Manufacturer Merck & Co

Pricing: U.S. (www.drugstore.com)

Suspension (reconstituted) (Pepcid)

40 mg/5 mL (50): $123.88

Tablets (Famotidine)

20 mg (30): $19.99

40 mg (90): $18.00

Tablets (Pepcid)

20 mg (30): $59.99

10 mg (12): $7.99

10 mg (18): $7.99

10 mg (30): $9.35

Mechanism of Action Competitive inhibition of histamine at H_2 receptors of the gastric parietal cells, which inhibits gastric acid secretion

Pharmacodynamics/Kinetics

Onset of action: GI: Oral: Within 1-3 hour; I.V.: 30 minutes

Duration: 10-12 hours

Protein binding: 15% to 20%

Bioavailability: Oral: 40% to 45%

Half-life elimination: Injection, oral suspension, tablet: 2.5-3.5 hours; prolonged with renal impairment; Oliguria: >20 hours

Time to peak, serum: Oral: ~1-3 hours

Excretion: Urine (25% to 30% [oral], 65% to 70% [I.V.] as unchanged drug)

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status May cause dizziness or drowsiness; may rarely cause insomnia

Mental Health: Effects on Psychiatric Treatment May cause agranulocytosis; use caution with clozapine and carbamazepine

Anesthesia and Critical Care Concerns/Other Considerations The 2008 Surviving Sepsis Campaign guidelines recommend that stress ulcer prophylaxis using an H_2 blocker (Grade 1A) or proton pump inhibitor (Grade 1B) be given to patients with severe sepsis to prevent upper GI bleed. Benefit of prevention of upper GI bleed must be weighed against potential effect of increased stomach pH on development of ventilator-associated pneumonia.

Jump To Field (Select Field Name)

Pharmacologic Category[Chemotherapy Regimen, Gastric Cancer]

Regimen UseGastric cancer

RegimenNOTE: Multiple variations are listed below.

Variation 1:

Methotrexate: I.V.: 1500 mg/m^2 day 1

[total dose/cycle = 1500 mg/m^2]

Fluorouracil: I.V.: 1500 mg/m^2 (1 hour after methotrexate) day 1

[total dose/cycle = 1500 mg/m^2]

Leucovorin: Oral: 15 mg/m^2 every 6 hours for 48 hours (start 24 hours after methotrexate) day 2

[total dose/cycle = 120 mg/m^2]

Doxorubicin: I.V.: 30 mg/m^2 day 15

[total dose/cycle = 30 mg/m^2]

Repeat cycle every 28 days

Variation 2:

Methotrexate: I.V.: 1500 mg/m^2 day 1

[total dose/cycle = 1500 mg/m^2]

Fluorouracil: I.V.: 1500 mg/m^2 (1 hour after methotrexate) day 1

[total dose/cycle = 1500 mg/m^2]

Leucovorin: Oral: 30 mg/m^2 every 6 hours for 8 doses (start 24 hours after methotrexate)

[total dose/cycle = 240 mg/m^2]

followed by Oral: 30 mg/m^2 every 6 hours for 8 more doses if 24-hour methotrexate level ≥2.5 mol/L

[total cumulative dose/cycle = 480 mg/m^2]

Doxorubicin: I.V.: 30 mg/m^2 day 15

[total dose/cycle = 30 mg/m^2]

Repeat cycle every 28 days

Variation 3:

Methotrexate: I.V.: 1000 mg/m^2 day 1

[total dose/cycle = 1000 mg/m^2]

Fluorouracil: I.V.: 1500 mg/m^2 (1 hour after methotrexate) day 1

[total dose/cycle = 1500 mg/m^2]

Leucovorin: Oral: 15 mg every 6 hours for 8 doses (start 24 hours after methotrexate)

[total dose/cycle = 120 mg/m^2]

Doxorubicin: I.V.: 30 mg/m^2 day 15

[total dose/cycle = 30 mg/m^2]

Repeat cycle every 28 days

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(fat e MUL shun)

U.S. Brand NamesIntralipid®; Liposyn® II; Liposyn® III

Canadian Brand NamesIntralipid®; Liposyn® II

Pharmacologic CategoryCaloric Agent

Use: Labeled IndicationsSource of calories and essential fatty acids for patients requiring parenteral nutrition of extended duration; prevention and treatment of essential fatty acid deficiency (EFAD)

Use: Unlabeled/InvestigationalLocal anesthetic-induced cardiac arrest unresponsive to conventional resuscitation

Dosing: Adults

Caloric source: I.V.: Initial dose: 1 g/kg/day, increase by 0.5-1 g/kg/day to a maximum of 2.5-3 g/kg/day

Prevention of essential fatty acid deficiency (EFAD): I.V.: Administer 8% to 10% of total caloric intake as fat emulsion (may be higher in stressed patients with EFAD); may be given 2-3 times weekly to meet essential fatty acid requirements

Local anesthetic toxicity (unlabeled use): 20%: 1.5 mL/kg administered over 1 minute, followed immediately by an infusion of 0.25 mL/kg/minute. Continue chest compressions (lipid must circulate). Repeat bolus every 3-5 minutes up to 3 mL/kg total dose until circulation restored. Continue infusion until hemodynamic stability is restored. Increase the infusion rate to 0.5 mL/kg/minute if BP declines. A maximum total dose of 8 mL/kg is recommended.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Caloric source: I.V.:

Premature infants: Initial dose: 0.25-0.5 g/kg/day, increase by 0.25-0.5 g/kg/day to a maximum of 3 g/kg/day depending on needs/nutritional goals; limit to 1 g/kg/day if on phototherapy; should be administered over 24 hours (A.S.P.E.N. guidelines)

Infants and Children: Initial dose: 0.5-1 g/kg/day, increase by 0.5 g/kg/day to a maximum of 3 g/kg/day depending on needs/nutritional goals; may administer over 24 hours (A.S.P.E.N. guidelines)

Note: Monitor triglycerides while receiving intralipids. If serum triglyceride levels >200 mg/dL, stop infusion and restart at 0.5-1g/kg/day. Intravenous heparin (1 unit/mL of parenteral nutrition) may enhance the clearance of lipid emulsions.

Administration: I.VCan be administered in a peripheral line or by central venous infusion. At the onset of therapy, the patient should be observed for any immediate allergic reactions such as dyspnea, cyanosis, and fever.

Children: Infuse for 10-15 minutes at a slower rate. Infuse 10% at ≤0.1 mL/minute; can increase to 1 mL/kg/hour if tolerated. Infuse 20% at ≤0.05 mL/minute; can increase to 0.5 mL/kg/hour if tolerated. **Note:** Premature and/or septic infants may need to reduce infusion rate. Do not exceed 1 g fat/kg in 4 hours in this population.

Adults: Infuse for 15-30 minutes at a slower rate. Infuse 10% at 1 mL/minute. If no untoward effects, can double rate. Infuse 20% at 0.5 mL/minute initially; can double rate if tolerated.

Administration: I.V. DetailCan be administered in a peripheral line or by central venous infusion. At the onset of therapy, the patient should be observed for any immediate allergic reactions such as dyspnea, cyanosis, and fever. Change tubing after each infusion. May be simultaneously infused with amino acid dextrose mixtures by means of Y-connector located near infusion site or administered in total nutrient mixtures (3-in-1) with amino acids, dextrose, and other nutrients. Hang fat emulsion higher than other fluids (has low specific gravity and could run up into other lines). Infuse via pump using either peripheral or central venous line.

Intralipid®, Liposyn® II: Do not use <1.2 micron filter

Liposyn® III: Do not use a filter.

pH: 6-9

Osmolality: 260-292 mOsmol/L

Dietary Considerations

Phosphorus: ~1.5 mMol /100 mL of emulsion

Caloric content: 10% fat emulsion = 1.1 kcal/mL; 20% fat emulsion = 2 kcal/mL; 30% fat emulsion = 3 kcal/mL

Fat emulsion should not exceed 60% of the total daily calories.

StorageDo not freeze. Do not store partly used containers; fat emulsion can support the growth of various organisms. Do not use if emulsion appears to be oiling out.

Intralipid®: Store below 25°C (77°F).

Liposyn®: Store below 30°C (86°F).

ContraindicationsHypersensitivity to fat emulsion or any component of the formulation; severe egg or legume (soybean) allergies; pathologic hyperlipidemia, lipoid nephrosis, acute pancreatitis associated with hyperlipemia

Warnings/Precautions

Boxed warnings:

- Pediatrics: See “Special populations” below.

Disease-related concerns:

- Anemia: Use with caution in patients with anemia.
- Bleeding disorders: Use with caution in patients with bleeding disorders.
- Fat embolism: Use with caution in patients who may be at danger for fat embolism.
- Hepatic impairment: Use with caution in patients with severe hepatic impairment.
- Pancreatitis: Use with caution in patients with pancreatitis without hyperlipidemia; ensure triglyceride levels remain <400 mg/dL.
- Respiratory disease: Use with caution in patients with respiratory disease.

Special populations:

- Pediatrics: Premature and small for gestational age infants clear intravenous fat emulsion poorly; serious and sometimes fatal reactions have occurred. **[U.S. Boxed Warning]: Strict adherence to proper infusion rates, dosing, and monitoring are necessary;** infusion rate should not exceed 1g fat/kg in 4 hours; strict monitoring of metabolic tolerance and elimination of infused fat from the circulation must occur. To avoid hyperlipidemia and/or fat deposition, do not exceed recommended daily doses.

Dosage form specific issues:

- Aluminum: Some formulations may contain aluminum which may accumulate following prolonged administration in renally-impaired patients. Due to immature renal function, premature neonates are at higher risk of accumulation/toxicity from aluminum.

Other warnings/precautions:

- Monitoring: Monitor triglyceride levels prior to next dose. Ensure clearance of lipid solution.
- Three-in-one mixtures: Lipid emulsion in a three-in-one mixture may obscure the presence of a precipitate; follow compounding guidelines, especially for calcium and phosphate additions.

Pregnancy Risk FactorC

Pregnancy Considerations

Reproductive studies have not been conducted. The A.S.P.E.N. guidelines for parenteral and enteral nutrition state that intravenous fat emulsion may be used safely in pregnant women to provide calories and prevent essential fatty acid deficiency.

LactationExcretion in breast milk unknown/compatible

Adverse Reactions<1%: Allergic reactions, back pain, brown pigment deposition in the reticuloendothelial system (“intravenous fat pigment”), chest pain, cholestasis, cyanosis, diaphoresis, dizziness, dyspnea, flushing, headache, hepatomegaly, hypercoagulability, hyperlipidemia, infusion site irritation, jaundice, leukopenia, liver function tests increased, nausea, pancreatitis, overloading syndrome (focal seizures, fever, leukocytosis, hepatomegaly, splenomegaly, shock), thrombocytopenia, vomiting

Monitoring ParametersMonitor line site for signs and symptoms of infection.

Monitor liver function tests periodically. Monitor triglycerides before initiation of lipid therapy and at least weekly during therapy; monitor especially closely in premature infants, septic infants, and patients with pancreatitis or liver disease.

Neonates: Frequent (some advise daily) platelet counts should be performed in neonatal patients receiving parenteral lipids.

Nursing: Physical Assessment/MonitoringAssess for allergy to eggs prior to initiating therapy (pruritic urticaria can occur in patients allergic to eggs). Inspect emulsion before administering. Do not administer if oil separation or oiliness is noted. Monitor closely for allergic reactions, fluid overload, thrombosis or sepsis.

Monitoring: Lab TestsMonitor liver function tests periodically. Monitor triglycerides before initiation of lipid therapy and at least weekly during therapy; monitor especially closely in premature infants, septic infants, and patients with pancreatitis or liver disease.

Neonates: Frequent (some advise daily) platelet counts should be performed in neonatal patients receiving parenteral lipids.

Patient EducationReport pain at infusion site, respiratory difficulty, chest pain, calf pain, or excessive sweating. **Pregnancy precaution:** Inform prescriber if you are pregnant

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, emulsion:

Intralipid®: 20% (100 mL, 250 mL, 500 mL, 1000 mL) [contains aluminum, egg yolk phospholipids, and soybean oil]; 30% (500 mL) [contains aluminum, egg yolk phospholipids, and soybean oil]

Liposyn® II: 10% (500 mL) [contains aluminum, egg yolk phospholipids, safflower oil, and soybean oil]; 20% (500 mL) [contains aluminum, egg yolk phospholipids, safflower oil, and soybean oil]

Liposyn® III: 10% (200 mL, 500 mL) [contains aluminum, egg yolk phospholipids, and soybean oil] ; 20% (200 mL, 500 mL) [contains aluminum, egg yolk phospholipids, and soybean oil]; 30% (500 mL) [contains aluminum, egg yolk phospholipids, and soybean oil]

Generic Available No

Mechanism of Action Fat emulsion is metabolized and utilized as an energy source; provides the essential fatty acids, linoleic acid, and alpha linolenic acid necessary for normal structure and function of cell membranes; in local anesthetic toxicity, lipid emulsion probably extracts lipophilic local anesthesia from cardiac muscle

Pharmacodynamics/Kinetics

Metabolism: Undergoes lipolysis to free fatty acids which are utilized by reticuloendothelial cells

Half-life elimination: 0.5-1 hour

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status May cause dizziness

Mental Health: Effects on Psychiatric Treatment None reported

Anesthesia and Critical Care Concerns/Other Considerations

Local anesthetic toxicity: Cardiac arrest: Lipid infusion has been used in animal studies and several human cases (Bupivacaine: Rosenblatt, 2006; Levobupivacaine: Foxall, 2007; Ropivacaine: Litz, 2006) where cardiovascular toxicity, unresponsive to conventional resuscitation, resulted. Additional information is available at http://www.lipidrescue.org.

Special Alerts

Antiepileptics: Increased Risk of Suicidal Behavior or Ideation - Updated: December 2008

The U.S. Food and Drug Administration (FDA) has issued an update following the completion of its analysis concerning the risk of suicidality (suicidal behavior or ideation) observed during clinical trials of various antiepileptic drugs (compared to placebo) in the treatment of epilepsy, psychiatric disorders, and other conditions. The pooled analysis of 199 clinical trials involving 11 antiepileptic drugs (carbamazepine, divalproex sodium, felbamate, gabapentin, lamotrigine, levetiracetam, oxcarbazepine, pregabalin, tiagabine, topiramate, zonisamide) as either monotherapy or as adjuvant therapy showed that patients receiving an antiepileptic had a 0.43% risk of suicidal behavior/ideation compared to 0.24% of patients receiving placebo. As a result of the findings, the FDA will require that the product labeling of the entire class of antiepileptics include a warning concerning the risk of suicidality, and a medication guide be developed informing patients of this risk.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antiepileptic

Antiepileptics: Increased Risk of Suicidal Behavior or Ideation - February 2008

The U.S. Food and Drug Administration (FDA) is informing healthcare professionals of an increased risk of suicidality (suicidal behavior or ideation) observed from analysis of clinical studies using various antiepileptic medications compared to placebo. The analysis was performed on 199 placebo-controlled studies involving 43,892 patients (27,863 treated patients versus 16,029 placebo patients) aged ≥5 years receiving one of the following 11 drugs: carbamazepine (Carbatrol®, Equetro™, Tegretol®, Tegretol® XR), felbamate (Felbatol®), gabapentin (Neurontin®), lamotrigine (Lamictal®), levetiracetam (Keppra®), oxcarbazepine (Trileptal®), pregabalin (Lyrica®), tiagabine (Gabitril®), topiramate (Topamax®), valproate (Depakote®, Depakote® ER, Depakene®, Depacon®), and zonisamide (Zonegran®). Studies examined medication efficacy in a variety of disorders, including epilepsy, psychiatric disorders (eg, depression, bipolar disorder), and other conditions (eg, migraine, neuropathic pain). According to the FDA, the results revealed a statistically significant increased risk of suicidality in 0.43% treated patients compared to 0.22% placebo patients, or an estimated 2.1 per 1000 (95% CI: 0.7, 4.2) more patients in the treated groups relative to placebo. This increased risk was reported anywhere from 1 week of therapy through 24 weeks. However, most trials were ≤24 weeks duration and the risk of suicide extending beyond 24 weeks is currently unknown. The relative risk of suicidal behavior or ideation in the treated patients was higher for patients with epilepsy (RR=3.6) compared to patients treated for psychiatric (RR=1.6) or other conditions (RR=2.3). Overall, the incidence of suicidal behavior or ideation occurred consistently across all demographic subgroups and with each of the drugs studied. Of note, four patients receiving an antiepileptic committed suicide relative to none in the placebo groups.

Forthcoming product labeling changes are likely to extend to all antiepileptic drugs and not limited to the drugs used in the studies, pending discussions scheduled for the upcoming advisory committee meeting. Healthcare professionals and family members/caregivers are encouraged to monitor patients receiving any antiepileptic medication for signs/symptoms of suicidality (eg, anxiety, depression, behavior changes). Patients should not stop taking their antiepileptic therapy unless advised by a healthcare professional.

Additional information can be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antiepileptic

Pronunciation(FEL ba mate)

U.S. Brand NamesFelbatol®

Pharmacologic CategoryAnticonvulsant, Miscellaneous

Use: Labeled IndicationsNot as a first-line antiepileptic treatment; only in those patients who respond inadequately to alternative treatments and whose epilepsy is so severe that a substantial risk of aplastic anemia and/or liver failure is deemed acceptable in light of the benefits conferred by its use. Patient must be fully advised of risk and provide signed written informed consent. Felbamate can be used as either monotherapy or adjunctive therapy in the treatment of partial seizures (with and without generalization) and in adults with epilepsy. Used as adjunctive therapy in the treatment of partial and generalized seizures associated with Lennox-Gastaut syndrome in children.

Dosing: Adults

Anticonvulsant, monotherapy: Oral:

Initial: 1200 mg/day in divided doses 3 or 4 times/day; titrate previously untreated patients under close clinical supervision, increasing the dosage in 600 mg increments every 2 weeks to 2400 mg/day based on clinical response and thereafter to 3600 mg/day as clinically indicated

Conversion to monotherapy: Initiate at 1200 mg/day in divided doses 3 or 4 times/day, reduce the dosage of the concomitant anticonvulsant(s) by 20% to 33% at the initiation of felbamate therapy; at week 2, increase the felbamate dosage to 2400 mg/day while reducing the dosage of the other anticonvulsant(s) up to an additional 33% of their original dosage; at week 3, increase the felbamate dosage up to 3600 mg/day and continue to reduce the dosage of the other anticonvulsant(s) as clinically indicated

Anticonvulsant, adjunctive therapy: Oral: Initial: 1200 mg/day in divided doses 3 or 4 times/day; may increase once per week by 1200 mg/day increments up to 3600 mg/day in divided doses 3 or 4 times/day.

Note: Dose of concomitant carbamazepine, phenobarbital, phenytoin, or valproic acid should be decreased by 20% to 33% when initiating felbamate therapy. Further dosage reductions may be necessary as dose of felbamate is increased.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Anticonvulsant, monotherapy: Oral: Children >14 years: Refer to adult dosing.

Adjunctive therapy: Oral:

Children 2-14 years with Lennox-Gastaut syndrome: Initial: 15 mg/kg/day in divided doses 3 or 4 times/day; may increase once per week by 15 mg/kg/day increments up to 45 mg/kg/day in divided doses 3 or 4 times/day.

Children >14 years: Refer to adult dosing.

Note: Dose of concomitant carbamazepine, phenobarbital, phenytoin, or valproic acid should be decreased by 20% to 33% when initiating felbamate therapy. Further dosage reductions may be necessary as dose of felbamate is increased.

Dosing: Renal ImpairmentUse caution; reduce initial and maintenance doses by 50% (half-life prolonged by 9-15 hours)

Administration: OralAdminister on an empty stomach for best absorption.

Dietary ConsiderationsMay be taken without regard to meals.

StorageStore in tightly closed container at controlled room temperature of 20°C to 25°C (68°F to 77°F).

RestrictionsA patient “informed consent” form should be completed and signed by the patient and physician. Copies are available from Wallace Pharmaceuticals by calling 800-526-3840 or 609-655-6147.

ContraindicationsHypersensitivity to felbamate any component of the formulation; or known sensitivity to other carbamates; history of any blood dyscrasia; hepatic dysfunction

Warnings/Precautions

Boxed warnings:

- Aplastic anemia: See “Concerns related to adverse effects” below.
- Hepatic failure: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Aplastic anemia: **[U.S. Boxed Warning]: Felbamate is associated with a significant increased risk of aplastic anemia.** Risk may be more than 100 fold greater than in untreated population. Current estimates of fatality are 20% to 30%, but higher rates (up to 70%) have been reported in the past. Aplastic anemia can develop at any point during therapy and for an unknown period of time after discontinuation of therapy. It is not known if dose, duration therapy, or concomitant medication use affects risk. Routine blood monitoring may be helpful in detecting hematologic changes before any clinical onset of signs/symptoms of the disease, however, aplastic anemia often develops without any prior indication or warnings. Discontinue use if any evidence of bone-marrow suppression occurs.

- Hepatic failure: **[U.S. Boxed Warning]: Has been associated with rare cases of hepatic failure (estimated >6 cases per 75,000 patients per year).** Of the cases reported in the literature, 67% have resulted in fatality or liver transplant. Onset may or may not be preceded by prodromal symptoms. It is not known whether dose, duration of therapy, or concomitant medication use affects risk. Monitoring of serum transaminases has not been demonstrated to prevent serious hepatic injury, however, early diagnosis and drug withdrawal may improve the likelihood of recovery. Obtain baseline transaminase levels and periodically thereafter; discontinue use if transaminase levels increase to ≥2 times the upper limit of normal or with signs/symptoms suggesting hepatic failure. Therapy should not be initiated or reintroduced in patients with evidence of hepatic damage or who discontinue use for any reason.

Disease-related concerns:

- Renal impairment: Use with caution in renal impairment; dose adjustment recommended.

Other warnings/precautions:

- Patient education: Patients should be thoroughly educated on the signs/symptoms of aplastic anemia and of hepatic failure prior to starting therapy. The patient or parent/guardian of the patient must provide written informed consent documenting the discussion of risks involved with therapy.

- Withdrawal: Anticonvulsants should not be discontinued abruptly because of the possibility of increasing seizure frequency; therapy should be withdrawn gradually to minimize the potential of increased seizure frequency, unless safety concerns require a more rapid withdrawal.

Geriatric ConsiderationsClinical studies have not included large numbers of patients >65 years of age. Due to decreased hepatic and renal function, dosing should start at the lower end of the dosage range.

Pregnancy Risk FactorC

Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women. Postmarketing case reports in humans include fetal death, genital malformation, anencephaly, encephalocele, and placental disorder.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsRat studies show a decreased weight and increased death in nursing pups. Felbamate has been detected in human milk. Adverse effects in human infants is unknown.

Adverse Reactions

>10%:

Central nervous system: Somnolence (children 48%; adults 19%), headache (children 7%; adults 7% to 37%), fever (children 23%; adults 3%), dizziness (18%), insomnia (9% to 18%), fatigue (7% to 17%), nervousness (7% to 16%)

Dermatologic: Purpura (children 13%)

Gastrointestinal: Anorexia (children 55%; adults 19%), vomiting (children 39%; adults 9% to 17%), nausea (children 7%; adults 34%), constipation (7% to 13%), dyspepsia (7% to 12%)

Respiratory: Upper respiratory infection (children 45%; adults 5% to 9%)

1% to 10%:

Cardiovascular: Chest pain (3%), facial edema (3%), palpitation (≥1%), tachycardia (≥1%)

Central nervous system: Nervousness (7% to 16%), abnormal thinking (7%), emotional lability (children 7%), ataxia (4% to 7%), depression (5%), anxiety (5%), stupor (3%), malaise ≥1%), agitation (≥1%) psychological disturbances (≥1%), aggressive reaction (≥1%), euphoria (≤1%), hallucination (≤1%), migraine (≤1%), suicide attempt (≤1%)

Dermatologic: Skin rash (children 10%; adults 3% to 4%), acne (3%), pruritus (≥1%), bullous eruption (≤1%), urticaria (≤1%)

Endocrine and metabolic: Hypophosphatemia (≤1% to 3%), intramenstrual bleeding (3%), hypokalemia (≤1%), hyponatremia (≤1%)

Gastrointestinal: Hiccup (children 10%), weight loss (3% to 7%), taste perversion (6%), diarrhea (5%), abdominal pain (5%), xerostomia (3%), weight gain (≥1%), appetite increased (≤1%), esophagitis (≤1%)

Genitourinary: Urinary tract infection (3%)

Hematologic: Leukopenia (1% to 7%), granulocytopenia (≤1%), lymphadenopathy (≤1%), leukocytosis (≤1%), thrombocytopenia (≤1%)

Hepatic: Liver function tests increased (1% to 4%), alkaline phosphatase increased (≤1%)

Neuromuscular & skeletal: Abnormal gait (children 10%; adults 5%), pain (children 7%), tremor (6%), paresthesia (4%), myalgia (3%), weakness (≥1%), dystonia (≤1%)

Ocular: Miosis (7%), diplopia (3% to 6%), abnormal vision (5%)

Otic: Otitis media (children 10%; adults 3%)

Respiratory: Pharyngitis (children 10%; adults 3%), cough (children 7%), rhinitis (7%), sinusitis (4%)

Miscellaneous: Flu-like syndrome (≥1%), lymphadenopathy (≥1%)

<1%, postmarketing, and/or case reports: Acute renal failure, agranulocytosis, allergic reaction, alopecia, anaphylactoid reaction, anemia, apathy, aplastic anemia, asthma exacerbation, atrial arrhythmia, atrial fibrillation, body odor, bradycardia, buccal mucous membrane swelling, cardiac arrest, cardiac failure, cerebrovascular disorder, cerebral edema, choreoathetosis, coagulation disorder, coma, concentration impaired, confusion, CPK increased, delusion, diaphoresis, DIC, dysphagia, dyspnea, dysarthria, dyskinesia, dysuria, embolism, encephalopathy, enteritis, eosinophilia, epistaxis, extrapyramidal disorder, fetal effects (anencephaly, death, encephalocele, genital malformations), flatulence, flushing, gastric ulcer, gastritis, gastroesophageal reflux, GI hemorrhage, gingival bleeding, glossitis, hematemesis, hematuria, hemianopsia, hemolytic anemia, Henoch-Schönlein vasculitis, hepatic failure, hepatitis, hepatorenal syndrome, hyperammonemia, hyper-/hypoglycemia, hyper-/hypotension, hypernatremia, hypocalcemia, hypomagnesemia, hypoxia, ileus, ischemic necrosis, jaundice, leukemia, lichen planus, livedo reticularis, manic reaction, mononeuritis, nephrosis, nystagmus, pancreatitis, pancytopenia, paralysis, paranoid reaction, peripheral ischemia, photosensitivity, platelet disorder, pleural effusion, pneumonitis, psychosis, pulmonary hemorrhage, rectal hemorrhage, renal function abnormal, respiratory depression, rhabdomyolysis, SIADH, Stevens-Johnson syndrome, sudden death, suicidal behavior/ideation, SVT, thrombophlebitis, torsade de pointes, toxic epidermal necrolysis, ulcerative stomatitis, urinary retention, urticaria, vaginal hemorrhage

Metabolism/Transport Effects

Substrate of CYP2E1 (minor), 3A4 (major); **Inhibits** CYP2C19 (weak); **Induces** CYP3A4 (weak)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Barbiturates: Felbamate may increase the serum concentration of Barbiturates. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Ketorolac: May diminish the therapeutic effect of Anticonvulsants. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Mefloquine: May diminish the therapeutic effect of Anticonvulsants. Mefloquine may decrease the serum concentration of Anticonvulsants. Management: Mefloquine is contraindicated in persons with a history of convulsions. If anticonvulsant is being used for another indication monitor response to treatment closely, as concurrent mefloquine may decrease response to treatment. *Risk D: Consider therapy modification*

Oral Contraceptive (Estrogens): Felbamate may decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Oral Contraceptive (Progestins): Felbamate may decrease the serum concentration of Oral Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Phenytoin: May increase the metabolism of Felbamate. Felbamate may increase the serum concentration of Phenytoin. *Risk D: Consider therapy modification*

Primidone: Felbamate may increase the serum concentration of Primidone. Specifically, the concentration of its metabolite, phenobarbital. *Risk C: Monitor therapy*

Valproic Acid: Felbamate may increase the serum concentration of Valproic Acid. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Food does not affect absorption.

Herb/Nutraceutical: Avoid evening primrose (seizure threshold decreased).

Monitoring ParametersMonitor serum levels of concomitant anticonvulsant therapy; obtain transaminases (AST, ALT) levels before initiation of therapy and periodically thereafter and bilirubin weekly. Hematologic evaluations before therapy begins, frequently during therapy, and for a significant period after discontinuation.

Reference RangeNot necessary to routinely monitor serum drug levels, since dose should be titrated to clinical response

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor therapeutic effectiveness (seizure activity, force, type, duration), laboratory values, and adverse reactions at beginning of therapy and periodically with long-term use. Taper dosage slowly when discontinuing. Assess knowledge/teach patient safety and seizure precautions, appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsMonitor serum levels of concomitant anticonvulsant therapy; obtain transaminases (AST, ALT) levels before initiation of therapy and periodically thereafter and bilirubin weekly. Hematologic evaluations before therapy begins, frequently during therapy, and for a significant period after discontinuation.

Patient EducationTake exactly as directed; do not increase dose or frequency or discontinue without consulting prescriber. While using this medication, do not use alcohol and other prescription or OTC medications (especially pain medications, sedatives, antihistamines, or hypnotics) without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); fever (especially in children), insomnia, fatigue, or nervousness; or nausea, vomiting, loss of appetite, or dry mouth (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Wear identification of epileptic status and medications. Report CNS changes, mentation changes, suicide ideation, or changes in cognition; muscle cramping, weakness, tremors, changes in gait; persistent GI symptoms (cramping, constipation, vomiting, anorexia); rash or skin irritations; unusual bruising or bleeding (mouth, urine, stool); cough, runny nose, sore throat, or respiratory difficulty; or worsening of seizure activity or loss of seizure control. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Suspension, oral:

Felbatol®: 600 mg/5 mL (240 mL, 960 mL)

Tablet:

Felbatol®: 400 mg; 600 mg

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Suspension (Felbatol)

600 mg/5 mL (237): $276.72

Tablets (Felbatol)

400 mg (90): $205.79

600 mg (90): $239.38

Mechanism of ActionMechanism of action is unknown but has properties in common with other marketed anticonvulsants; has weak inhibitory effects on GABA-receptor binding, benzodiazepine receptor binding, and is devoid of activity at the MK-801 receptor binding site of the NMDA receptor-ionophore complex.

Pharmacodynamics/Kinetics

Absorption: Rapid and almost complete; food has no effect upon the tablet's absorption

Distribution: V_d: 0.7-0.8 L/kg

Protein binding: 22% to 25%, primarily to albumin

Half-life elimination: 20-23 hours (average); prolonged in renal dysfunction

Time to peak, serum: 3-5 hours

Excretion: Urine (40% to 50% as unchanged drug, 40% as inactive metabolites)

Related Information

- Status Epilepticus

Pharmacotherapy PearlsMonotherapy has not been associated with gingival hyperplasia, impaired concentration, weight gain, or abnormal thinking. Because felbamate is the only drug shown effective in Lennox-Gastaut syndrome, it is considered an orphan drug for this indication.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation) and abnormal taste.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusAnxiety and dizziness are common; may cause drowsiness, insomnia, or depression

Mental Health: Effects on Psychiatric TreatmentCarbamazepine may decrease effects of felbamate; may increase effects of valproic acid

Anesthesia and Critical Care Concerns/Other ConsiderationsMonotherapy has not been associated with gingival hyperplasia, impaired concentration, weight gain, or abnormal thinking. Because felbamate is the only drug shown effective in Lennox-Gastaut syndrome, it is considered an orphan drug.

Medication Safety Issues

Sound-alike/look-alike issues:

Plendil® may be confused with Isordil®, pindolol, Pletal®, Prilosec®, Prinivil®

Pronunciation (fe LOE di peen)

U.S. Brand Names Plendil®

Canadian Brand Names Plendil®; Renedil®

Pharmacologic Category Calcium Channel Blocker

Use: Labeled Indications Treatment of hypertension

Use: Unlabeled/Investigational Pediatric hypertension

Dosing: Adults Hypertension: Oral: 2.5-10 mg once daily; increase by 5 mg at 2-week intervals, as needed, to a maximum of 20 mg/day; usual dose range (JNC 7): 2.5-20 mg once daily.

Dosing: Elderly Oral: Initial 2.5 mg/day

Dosing: Pediatric Hypertension (unlabeled use): Oral: Initial: 2.5 mg once daily; maximum: 10 mg/day

Dosing: Hepatic Impairment Initial: 2.5 mg/day; monitor blood pressure

Administration: Oral Do not crush or chew extended release tablets; swallow whole.

Dietary Considerations Should be taken without food.

Contraindications Hypersensitivity to felodipine, any component of the formulation, or other calcium channel blocker

Allergy Considerations

- Calcium Channel Blocker, Dihydropyridine Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Angina/MI: Increased angina and/or MI has occurred with initiation or dosage titration of dihydropyridine calcium channel blockers; reflex tachycardia may occur resulting in angina and/or MI in patients with obstructive coronary disease especially in the absence of concurrent beta-blockade.
- Hypotension/syncope: Symptomatic hypotension with or without syncope can rarely occur; blood pressure must be lowered at a rate appropriate for the patient's clinical condition.
- Peripheral edema: The most common side effect is peripheral edema (dose dependent); occurs within 2-3 weeks of starting therapy.

Disease-related concerns:

- Aortic stenosis: Use with extreme caution in patients with severe aortic stenosis; may reduce coronary perfusion resulting in ischemia.
- Heart failure: Use with caution in patients with heart failure. Safety and efficacy have not been established.
- Hepatic impairment: Use with caution in patients with hepatic impairment; may require lower starting dose.
- Hypertrophic cardiomyopathy (HCM) with outflow tract obstruction: Use with caution in patients with HCM and outflow tract obstruction since reduction in afterload may worsen symptoms associated with this condition.

Special populations:

- Elderly: Initiate at a lower dose in the elderly.
- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Titration: Dosage titration should occur after 14 days on a given dose.

Geriatric Considerations Elderly may experience a greater hypotensive response. Constipation may be more of a problem in the elderly. Calcium channel blockers are no more effective in the elderly than other therapies; however, they do not cause significant CNS effects which is an advantage over some antihypertensive agents.

Pregnancy Risk Factor C

Pregnancy Considerations Potentially, calcium channel blockers may prolong labor. There are no adequate or well-controlled studies in pregnant women.

Lactation Excretion in breast milk unknown/not recommended

Adverse Reactions

>10%: Central nervous system: Headache (11% to 15%)

2% to 10%: Cardiovascular: Peripheral edema (2% to 17%), tachycardia (0.4% to 2.5%), flushing (4% to 7%)

<1% (Limited to important or life-threatening): Abdominal pain, acid regurgitation, anemia, angioedema, angina pectoris, anxiety disorders, arm pain, arrhythmia, arthralgia, back pain, bronchitis, chest pain, CHF, constipation, contusion, CVA, decreased libido, depression, diarrhea, dizziness, dry mouth, dyspnea, dysuria, epistaxis, erythema, facial edema, flatulence, flu-like illness, flushing, foot pain, gingival hyperplasia, gynecomastia, hip pain, hypotension, impotence, influenza, insomnia, irritability, knee pain, leg pain, leukocytoclastic vasculitis, MI, muscle cramps, myalgia, MI, nausea, nervousness, palpitation, paresthesia, pharyngitis, polyuria, premature beats, respiratory infection, sinusitis, somnolence, syncope, urinary frequency, urinary urgency, urticaria, visual disturbances, vomiting

Metabolism/Transport Effects **Substrate** of CYP3A4 (major); **Inhibits** CYP2C8 (moderate), 2C9 (weak), 2D6 (weak), 3A4 (weak)

Drug Interactions

Alpha1-Blockers: May enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): May enhance the hypotensive effect of Calcium Channel Blockers (Dihydropyridine). Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). *Risk C: Monitor therapy*

Calcium Salts: May diminish the therapeutic effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Calcium Channel Blockers (Dihydropyridine). *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Clopidogrel: Calcium Channel Blockers may diminish the therapeutic effect of Clopidogrel. *Risk C: Monitor therapy*

CycloSPORINE: May decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). Nicardipine may likewise inhibit the metabolism of cyclosporine. Cyclosporine dosage adjustments might be needed. *Risk C: Monitor therapy*

CYP2C8 Substrates (High risk): CYP2C8 Inhibitors (Moderate) may decrease the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Grapefruit Juice: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Calcium Channel Blockers. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Magnesium Salts: Calcium Channel Blockers may enhance the adverse/toxic effect of Magnesium Salts. Magnesium Salts may enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nafcillin: May increase the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents (Nondepolarizing): Calcium Channel Blockers may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). *Risk C: Monitor therapy*

Nitroprusside: Calcium Channel Blockers may enhance the hypotensive effect of Nitroprusside. *Risk C: Monitor therapy*

Phenytoin: Calcium Channel Blockers may decrease the metabolism of Phenytoin. *Risk D: Consider therapy modification*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). *Risk D: Consider therapy modification*

Quinupristin: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Calcium Channel Blockers. This primarily affects oral forms of calcium channel blockers. *Risk D: Consider therapy modification*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Tacrolimus: Calcium Channel Blockers (Dihydropyridine) may increase the serum concentration of Tacrolimus. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Increases felodipine's absorption; watch for a greater hypotensive effect.

Food: Increased therapeutic and vasodilator side effects, including severe hypotension and myocardial ischemia, may occur if felodipine is taken with grapefruit juice; avoid concurrent use. High-fat/carbohydrate meals will increase C_{max} by 60%; grapefruit juice will increase C_{max} by twofold.

Herb/Nutraceutical: St John's wort may decrease felodipine levels. Avoid dong quai if using for hypertension (has estrogenic activity). Avoid ephedra, yohimbe, ginseng (may worsen hypertension). Avoid garlic (may have increased antihypertensive effect).

Nursing: Physical Assessment/MonitoringUse caution in presence of heart failure. Assess potential for interactions with pharmacological agents or herbal products patient may be taking (eg, beta-blockers or other drugs that effect blood pressure). Assess for therapeutic effectiveness and signs/symptoms of adverse reactions at beginning of therapy, when changing dosage, and periodically throughout long-term therapy. When discontinuing, taper gradually (over 2 weeks). Teach patient proper use, possible side effects/interventions, and adverse symptoms to report.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take exactly as directed, without food. Avoid concurrent grapefruit juice and alcohol (may cause dangerous hypotension). Swallow whole, do not crush or chew. Do not alter dose or stop taking without consulting prescriber. May cause headache (consult prescriber for analgesic); nausea or vomiting (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); constipation (increased dietary bulk and fluids may help); or drowsiness (use caution when driving or engaging in tasks that require alertness until response to drug is known). Report irregular heartbeat, chest pain or palpitations; persistent headache; vomiting; constipation; peripheral or facial swelling; weight gain >5 lb/week; dyspnea or respiratory changes. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, extended release: 2.5 mg, 5 mg, 10 mg

Plendil®: 2.5 mg, 5 mg, 10 mg

Generic AvailableYes

ManufacturerAstraZeneca Pharmaceuticals LP

Pricing: U.S. (www.drugstore.com)

Tablet, 24-hour (Felodipine)

2.5 mg (30): $37.99

5 mg (30): $38.99

10 mg (100): $183.98

Tablet, 24-hour (Plendil)

2.5 mg (30): $49.03

5 mg (30): $52.97

10 mg (30): $89.42

Mechanism of ActionInhibits calcium ions from entering the “slow channels” or select voltage-sensitive areas of vascular smooth muscle and myocardium during depolarization, producing a relaxation of coronary vascular smooth muscle and coronary vasodilation; increases myocardial oxygen delivery in patients with vasospastic angina

Pharmacodynamics/Kinetics

Onset of action: Antihypertensive: 2-5 hours

Duration of antihypertensive effect: 24 hours

Absorption: 100%; Absolute: 20% due to first-pass effect

Protein binding: >99%

Metabolism: Hepatic; CYP3A4 substrate (major); extensive first-pass effect

Half-life elimination: Immediate release: 11-16 hours

Excretion: Urine (70% as metabolites); feces 10%

Related Information

- Calcium Channel Blockers

Pharmacotherapy PearlsFelodipine maintains renal and mesenteric blood flow during hemorrhagic shock in animals.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Gingival hyperplasia (fewer reports than other CCBs, resolves upon discontinuation, consultation with physician is suggested).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness; rarely may cause nervousness, insomnia, or depression

Mental Health: Effects on Psychiatric TreatmentCarbamazepine may decrease felodipine effect

Cardiovascular Considerations

Heart Failure: The V-HeFT III trial randomly assigned 450 male patients with chronic heart failure (on ACE Inhibitor and diuretic) to felodipine (5 mg twice daily) or placebo for an average of 18 months. After 3 month follow-up, the felodipine patients initially had an improvement in their LVEF and atrial natriuretic peptide, but those improvements did not persist. Felodipine prevented worsening of exercise tolerance and quality of life, but it was not significantly different from placebo until about 27 months into therapy. Mortality and hospitalization rates were similar between the groups. Peripheral edema occurred more frequently in the felodipine group. There is a general lack of benefit from use of felodipine in the treatment of chronic heart failure. The ACC/AHA 2005 Heart Failure Guidelines do not recommend the use of calcium channel blockers for chronic heart failure.

Hypertension: Felodipine alone or in combination with other agents is effective in the management of hypertension.

Medication Safety Issues

Sound-alike/look-alike issues:

TriCor® may be confused with Tracleer®

Pronunciation(fen oh FYE brate)

U.S. Brand NamesAntara™; Fenoglide™; Lipofen™; Lofibra®; TriCor®; Triglide™

Canadian Brand NamesApo-Feno-Micro®; Apo-Fenofibrate®; Dom-Fenofibrate Supra; Gen-Fenofibrate Micro; Lipidil EZ®; Lipidil Micro®; Lipidil Supra®; Novo-Fenofibrate; Novo-Fenofibrate-S; Nu-Fenofibrate; PHL-Fenofibrate Supra; PMS-Fenofibrate Micro; PMS-Fenofibrate Supra; ratio-Fenofibrate MC; Sandoz Fenofibrate S; TriCor®

Pharmacologic CategoryAntilipemic Agent, Fibric Acid

Use: Labeled IndicationsAdjunct to dietary therapy for the treatment of adults with elevations of serum triglyceride levels (types IV and V hyperlipidemia); adjunct to dietary therapy for the reduction of low density lipoprotein cholesterol (LDL-C), total cholesterol (total-C), triglycerides, and apolipoprotein B (apo B) in adult patients with primary hypercholesterolemia or mixed dyslipidemia (Fredrickson types IIa and IIb)

Dosing: Adults

Hypertriglyceridemia: Oral Initial:

Antara™ (micronized): 43-130 mg/day; maximum dose: 130 mg/day

Fenoglide™: 40-120 mg/day; maximum dose: 120 mg/day

Lipofen™: 50-150 mg/day; maximum dose: 150 mg/day

Lofibra® (micronized): 67-200 mg/day with meals; maximum dose: 200 mg/day

Lofibra® (tablets): 54-160 mg/day; maximum dose: 160 mg/day

TriCor®: 48-145 mg/day; maximum dose: 145 mg/day

Triglide™: 50-160 mg/day; maximum dose: 160 mg/day

Hypercholesterolemia or mixed hyperlipidemia: Oral:

Antara™ (micronized): 130 mg/day

Fenoglide™: 120 mg/day

Lipofen™: 150 mg/day

Lofibra® (micronized): 200 mg/day

Lofibra® (tablets): 160 mg/day

TriCor®: 145 mg/day

Triglide™: 160 mg/day

Dosing: ElderlyOral: Initial:

Antara™ (micronized): 43 mg/day

Fenoglide™: Adjust dosage based on creatinine clearance

Lipofen™: 50 mg/day

Lofibra® (micronized): 67 mg/day

Lofibra® (tablets): 54 mg/day

TriCor®: Adjust dosage based on creatinine clearance

Triglide™: 50 mg/day

Dosing: Renal ImpairmentMonitor renal function and lipid panel before adjusting. Decrease dose or increase dosing interval for patients with renal failure: Initial:

Antara™ (micronized): 43 mg/day

Fenoglide™:

Cl_{cr} 31-80 mL/minute: 40 mg/day

Cl_{cr} ≤30 mL/minute: **Contraindicated**

Lipofen™: 50 mg/day

Lofibra® (micronized): 67 mg/day

Lofibra® (tablets): 54 mg/day

TriCor®:

Cl_{cr} 31-80 mL/minute: 48 mg/day

Cl_{cr} ≤30 mL/minute: **Contraindicated**

Triglide™: 50 mg/day

Calculations

- Creatinine Clearance: Adults

Administration: Oral6-8 weeks of therapy is required to determine efficacy.

Fenoglide™, Lofibra® (capsules [micronized] and tablets), Lipofen™: Administer with meals.

Antara™, TriCor®: May be administered with or without food.

Triglide™: Do not consume chipped or broken tablets. May be administered with or without food.

Dietary Considerations

Fenoglide™, Lofibra® (capsules [micronized] and tablets), Lipofen™: Take with meals.

Antara™, TriCor®, Triglide™: May be taken with or without food.

StorageStore at 15°C to 30°C (59°F to 86°F). Protect from light and moisture. Store tablets in moisture-protective container.

ContraindicationsHypersensitivity to fenofibrate or any component of the formulation; hepatic dysfunction including primary biliary cirrhosis and unexplained persistent liver function abnormalities; severe renal dysfunction; pre-existing gallbladder disease; breast-feeding (only Fenoglide™)

Allergy Considerations

- Fibric Acid Derivative Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Cholelithiasis: May cause cholelithiasis.
- Hemogloblin/hematocrit/WBC effects: May cause mild to moderate decreases in hemoglobin, hematocrit and WBC upon initiation of therapy which usually stabilizes with long-term therapy.
- Hepatic effects: Hepatic transaminases can become significantly elevated (dose-related); hepatocellular, chronic active, and cholestatic hepatitis have been reported. Regular monitoring of liver function tests is required.
- Hypersensitivity reactions: Rarely hypersensitivity reactions (eg, severe skin rash, Stevens-Johnson syndrome, toxic epidermal necrolysis) may occur.
- Myopathy/rhabdomyolysis: Has been associated with rare myositis or rhabdomyolysis; patients should be monitored closely. Patients should be instructed to report unexplained muscle pain, tenderness, weakness, or brown urine.
- Renal effects: Increases in serum creatinine (>2 mg/dL) have been observed with use; monitor renal function in patients with renal impairment and consider monitoring patients with increased risk for developing renal impairment.
- Venous thromboembolism (VTE): Use has been associated with pulmonary embolism (PE) and deep vein thrombosis (DVT). Use with caution in patients with risk factors for VTE.

Disease-related concerns:

- Renal impairment: Use with caution in patients with mild-to-moderate renal impairment; dosage adjustment required. Contraindicated with severe renal impairment (Cl_{cr} ≤30 mL/minute).

Concurrent drug therapy issues:

- HMG-CoA reductase inhibitors: Use caution with HMG-CoA reductase inhibitors; may lead to myopathy, rhabdomyolysis. In combination with HMG-CoA reductase inhibitors, fenofibrate is generally regarded as safer than gemfibrozil due to limited pharmacokinetic interaction with statins.

- Warfarin: Use with caution in patient taking warfarin; adjustments in warfarin therapy may be required.

Special populations:

- Elderly: Due to a higher incidence of renal impairment, use with caution in the elderly; dosage adjustment required.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Hyperlipidemia: Secondary causes of hyperlipidemia should be ruled out prior to therapy.

- Optimal response: Therapy should be withdrawn if an adequate response is not obtained after 2 months of therapy at the maximal daily dose. The occurrence of pancreatitis may represent a failure of efficacy in patients with severely elevated triglycerides.

Geriatric ConsiderationsThe definition of and, therefore, when to treat hyperlipidemia in the elderly is a controversial issue. The National Cholesterol Education Program recommends that all adults maintain a plasma cholesterol <160 mg/dL. Older adults with one additional risk factor, goal LDL would be <130 mg/dL. It is the authors' belief that pharmacologic treatment be reserved for those who are unable to obtain a desirable plasma cholesterol concentration by diet alone and for whom the benefits of treatment are believed to outweigh the potential adverse effects, drug interactions, and cost of treatment.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal studies have shown embryocidal and teratogenic effect. There are no adequate and well-controlled studies in pregnant women. Use should be avoided, if possible, in pregnant women since the neonatal glucuronide conjugation pathways are immature.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsTumor formation was observed in animal studies; nursing is not recommended if the medication cannot be discontinued.

Adverse Reactions

>10%: Hepatic: ALT increased (dose related; 3% to 13%), AST increased (dose related; 3% to 13%)

1% to 10%:

Central nervous system: Headache (3%)

Gastrointestinal: Abdominal pain (5%), constipation (2%)

Neuromuscular & skeletal: Back pain (3%)

Respiratory: Respiratory disorder (6%), rhinitis (2%)

Postmarketing and/or case reports (limited to important or life-threatening): Abnormal vision, acne, agranulocytosis, allergic reaction, alopecia, amblyopia, anemia, angina pectoris, anorexia, anxiety, appetite increased, arrhythmia, arthralgia, arthritis, arthrosis, asthma, atrial fibrillation, bronchitis, bruising, bursitis, cardiovascular disorder, cataract, chest pain, cholecystitis, cholelithiasis, cholestatic hepatitis, cirrhosis, colitis, conjunctivitis, contact dermatitis, coronary artery disorder, cough increased, creatine phosphokinase increased, creatinine increased, cyst, cystitis, deep venous thrombosis, depression, diabetes mellitus, diaphoresis, diarrhea, dizziness, dry mouth, duodenal ulcer, dyspepsia, dyspnea, dysuria, ear pain, eczema, edema, electrocardiogram abnormality, eosinophilia, eructation, esophagitis, extrasystoles, eye disorder, fatty liver deposits, fever, flatulence, fungal dermatitis, gastritis, gastroenteritis, gastrointestinal disorder, gout, gynecomastia, hepatitis, hernia, herpes simplex, herpes zoster, hyper-/hypotension, hypersensitivity reaction, hypertonia, hyperuricemia, hypoglycemia, infection, insomnia, joint disorder, kidney function abnormality, laryngitis, leg cramps, leukopenia, libido decreased, lymphadenopathy, maculopapular rash, malaise, MI, muscle pain, myalgia, myasthenia, myopathy, myositis, nail disorder, nausea, nervousness, neuralgia, otitis media, pain, palpitation, pancreatitis, paresthesia, peptic ulcer, peripheral edema, peripheral vascular disorder, pharyngitis, phlebitis, photosensitivity reaction, pneumonia, pregnancy (unintended), prostatic disorder, pruritus, pulmonary embolus, rectal disorder, rectal hemorrhage, refraction disorder, rhabdomyolysis, sinusitis, skin ulcer, somnolence, Stevens-Johnson syndrome, tachycardia, tenderness, tenosynovitis, thrombocytopenia, tooth disorder, toxic epidermal necrolysis, urinary frequency, urolithiasis, urticaria, vaginal moniliasis, varicose veins, vasodilatation, vertigo, vomiting, weakness, weight gain/loss

Metabolism/Transport Effects**Substrate** of CYP3A4 (minor); **Inhibits** CYP2A6 (weak), 2C8 (weak), 2C9 (weak), 2C19 (weak)

Drug Interactions

Bile Acid Sequestrants: May decrease the absorption of Fibric Acid Derivatives. **Exceptions:** Colesevelam. *Risk D: Consider therapy modification*

Ezetimibe: Fibric Acid Derivatives may increase the serum concentration of Ezetimibe. *Risk C: Monitor therapy*

HMG-CoA Reductase Inhibitors: Fenofibrate may enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Sulfonylureas: Fibric Acid Derivatives may enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Fibric Acid Derivatives may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Warfarin: Fenofibrate may enhance the anticoagulant effect of Warfarin. Fenofibrate may increase the serum concentration of Warfarin. *Risk D: Consider therapy modification*

Monitoring ParametersPeriodic blood counts during first year of therapy. Total cholesterol, LDL-C, triglycerides, and HDL-C should be measured periodically; If only marginal changes are noted in 6-8 weeks, the drug should be discontinued. Monitor LFTs regularly and discontinue therapy if levels remain >3 times normal limits.

Nursing: Physical Assessment/MonitoringUse caution and monitor closely in presence of hepatic or renal dysfunction, gallbladder disease, and advanced age. Assess potential for interactions with other pharmacological agents the patient may be taking (eg, increased risk of myopathy and rhabdomyolysis). Assess results of laboratory tests and patient response (eg, arrhythmias, gastrointestinal upset, CNS changes, hypoglycemia, myalgia) on a regular basis throughout therapy. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsTotal serum cholesterol and triglyceride concentration and CLDL, LDL, and HDL levels should be measured periodically; if only marginal changes are noted in 6-8 weeks, the drug should be discontinued. Serum transaminases should be measured every 3 months; if ALT values increase >100 units/L, therapy should be discontinued. Monitor LFTs prior to initiation, at 6 and 12 weeks after initiation or first dose, then periodically thereafter.

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber. Take exactly as directed. Do not change dosage, dosage form, or frequency without consulting prescriber. Maintain diet and exercise program as prescribed. If you are a diabetic taking a sulfonylurea, monitor blood sugars closely; this medication may alter the effects of your antidiabetic medication. You may experience mild GI disturbances (eg, gas, diarrhea, constipation, nausea); inform prescriber if these are severe. Report immediately unusual muscle pain or weakness; skin rash or irritation; insomnia; persistent dizziness; chest pain or palpitations; difficult respirations; pain, swelling, redness, or heat in extremities; or any other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule:

- Lipofen™: 50 mg; 100 mg [DSC]; 150 mg

Capsule [micronized]: 67 mg, 134 mg, 200 mg

- Antara™: 43 mg, 130 mg
- Lofibra®: 67 mg, 134 mg, 200 mg

Tablet: 54 mg, 160 mg

- Fenoglide™: 40 mg, 120 mg
- Lofibra®: 54 mg, 160 mg
- TriCor®: 48 mg, 145 mg
- Triglide™: 50 mg, 160 mg

Generic AvailableYes: Micronized capsule and tablet

Pricing: U.S. (www.drugstore.com)

Capsules (Antara)

- 43 mg (30): $45.99
- 130 mg (30): $124.79

Capsules (Fenofibrate)

- 134 mg (100): $139.98
- 200 mg (30): $65.99

Capsules (Lofibra)

- 67 mg (30): $34.64
- 134 mg (30): $55.90
- 200 mg (30): $85.07

Tablets (Fenofibrate)

- 54 mg (90): $64.99
- 160 mg (30): $67.99

Tablets (Lofibra)

- 160 mg (30): $83.99

Tablets (Tricor)

- 48 mg (30): $46.74
- 145 mg (30): $123.15

Tablets (Triglide)

- 160 mg (30): $129.59

Mechanism of ActionFenofibric acid, an agonist for the nuclear transcription factor peroxisome proliferator-activated receptor-alpha (PPAR-alpha), downregulates apoprotein C-III (an inhibitor of lipoprotein lipase) and upregulates the synthesis of apolipoprotein A-I, fatty acid transport protein, and lipoprotein lipase resulting in an increase in VLDL catabolism, fatty acid oxidation, and elimination of triglyceride-rich particles; as a result of a decrease in VLDL levels, total plasma triglycerides are reduced by 30% to 60%; modest increase in HDL occurs in some hypertriglyceridemic patients.

Pharmacodynamics/Kinetics

Absorption: Increased when taken with meals

Distribution: Widely to most tissues

Protein binding: >99%

Metabolism: Tissue and plasma via esterases to active form, fenofibric acid; undergoes inactivation by glucuronidation hepatically or renally

Half-life elimination: Fenofibric acid: Mean: 20 hours (range: 10-35 hours)

Time to peak: 3-8 hours

Excretion: Urine (60% as metabolites); feces (25%); hemodialysis has no effect on removal of fenofibric acid from plasma

Related Information

- Hyperlipidemia Management
- Lipid-Lowering Agents

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Dry mouth and tooth disorder.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay rarely cause drowsiness or insomnia
Mental Health: Effects on Psychiatric TreatmentNone reported
Cardiovascular ConsiderationsFibric acids decrease triglycerides (TGs) by 20% to 50%, and increase HDL-cholesterol (HDL-C) by 10% to 20%. They decrease LDL-cholesterol (LDL-C) by 5% to 20%, however, LDL-C actually may increase by 10% to 30% when fibrates are initiated in patients with high TGs (>400 mg/dL). Although combination therapy with statins has been used in patients with resistant hyperlipidemias, keep vigilant for signs and symptoms of myopathy.

The combination of ezetimibe and fenofibrate is FDA approved for treatment of mixed hyperlipidemia. Dosing regimen approved: Ezetimibe 10 mg and fenofibrate 160 mg once daily.

Index TermsProcetofene; Proctofene

Special Alerts

TriLipix™ (Fenofibric Acid) Product Availability

TriLipix™ was approved by the U.S. Food and Drug Administration (FDA) in December 2008. It is expected to be available in January of 2009. No specific release date has been announced.

Medication Safety Issues

Sound-alike/look-alike issues:

TriLipix™ may be confused with Trileptal®, TriLyte®

Pronunciation(fen oh FYE brik AS id)

U.S. Brand NamesTriLipix™

Pharmacologic CategoryAntilipemic Agent, Fibric Acid

Use: Labeled IndicationsAdjunct to dietary therapy for the treatment of severely elevated serum triglyceride levels; adjunct to dietary therapy for the reduction of low density lipoprotein cholesterol (LDL-C), total cholesterol (total-C), triglycerides, and apolipoprotein B (apo B) and to increase high density lipoprotein cholesterol (HDL-C) in patients with primary hypercholesterolemia or mixed dyslipidemia; adjunct to dietary therapy concomitantly with a statin to reduce triglyceride levels and increase HDL-C levels in patients with mixed dyslipidemia and coronary heart disease (CHD) or at risk for CHD

Dosing: Adults

Mixed dyslipidemia (coadministered with a statin): Oral: 135 mg once daily (maximum: 135 mg/day)

Hypertriglyceridemia: Oral: Initial: 45-135 mg once daily; Maintenance: Individualize according to patient response (maximum: 135 mg/day)

Primary hypercholesterolemia or mixed dyslipidemia: Oral: 135 mg once daily (maximum: 135 mg/day)

Dosing: ElderlyOral: Dosage based on renal function

Dosing: Renal Impairment

Mild-to-moderate impairment (Cl_{cr} 30-80 mL/minute): Initial: 45 mg once daily; only increase once effects on lipids and renal function evaluated

Severe impairment(Cl_{cr} <30 mL/minute; with or without dialysis): Contraindicated

Calculations

- Creatinine Clearance: Adults

Administration: OralMay be administered with or without food.

Dietary ConsiderationsMay be taken with or without food. Patients should follow appropriate lipid-lowering diet.

StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Protect from light and moisture.

RestrictionsAn FDA-approved patient medication guide is available and must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to fenofibric acid, choline fenofibrate, fenofibrate, or any component of the formulation; hepatic dysfunction including primary biliary cirrhosis and unexplained persistent liver function abnormalities; severe renal dysfunction (including patients on dialysis); pre-existing gallbladder disease; breast-feeding

Warnings/Precautions

Concerns related to adverse effects:

- Cholelithiasis: May cause cholelithiasis; discontinue if gallstones found upon gallbladder studies.
- Hemogloblin/hematocrit/WBC effects: May cause mild-to-moderate decreases in hemoglobin, hematocrit and WBC upon initiation of therapy which usually stabilizes with long-term therapy. Agranulocytosis and thrombocytopenia have rarely been reported.
- Hepatic effects: Hepatic transaminases can become significantly elevated (dose-related); hepatocellular, chronic active, and cholestatic hepatitis have been reported. Regular monitoring of liver function tests is required.
- Hypersensitivity reactions: Rarely hypersensitivity reactions (eg, severe skin rash, Stevens-Johnson syndrome, toxic epidermal necrolysis) may occur.
- Myopathy/rhabdomyolysis: Has been associated with rare myositis or rhabdomyolysis; patients should be monitored closely. Risk increased in the elderly, patients with diabetes mellitus, renal failure, or hypothyroidism. Patients should be instructed to report

unexplained muscle pain, tenderness, weakness, or brown urine.

- Renal effects: Increases in serum creatinine (>2 mg/dL) have been observed with use; monitor renal function in patients with renal impairment and consider monitoring patients with increased risk for developing renal impairment.

- Venous thromboembolism (VTE): Use has been associated with pulmonary embolism (PE) and deep vein thrombosis (DVT). Use with caution in patients with risk factors for VTE.

Disease-related concerns:

- Renal impairment: Use with caution in patients with mild-to-moderate renal impairment; dosage adjustment required. Contraindicated with severe renal impairment.

Concurrent drug therapy issues:

- Anticoagulants: Use with caution in patient taking oral anticoagulants (eg, warfarin); adjustments in therapy may be required.

- HMG-CoA reductase inhibitors: Use caution with HMG-CoA reductase inhibitors; may lead to myopathy, rhabdomyolysis. In combination with HMG-CoA reductase inhibitors, fenofibric acid derivatives are generally regarded as safer than gemfibrozil due to limited pharmacokinetic interaction with statins.

Special populations:

- Elderly: Due to a higher incidence of renal impairment, use with caution in the elderly; dosage adjustment based on renal function may be required.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Hyperlipidemia: Secondary causes of hyperlipidemia should be ruled out prior to therapy.

- Optimal response: Therapy should be withdrawn if an adequate response is not obtained after 2-3 months of therapy at the maximal daily dose. In patients with severe hypertriglyceridemia, the occurrence of pancreatitis may represent a failure of efficacy.

Pregnancy Risk FactorC
Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women. Use only if benefits outweigh the risks.
LactationExcretion in breast milk unknown/contraindicated
Adverse ReactionsAdverse reactions and frequency reported as observed during monotherapy and concurrent administration with a statin.

>10%: Central nervous system: Headache (12% to 13%)

1% to 10%:

Central nervous system: Dizziness (3% to 4%), pain (1% to 4%), fatigue (2% to 3%)

Gastrointestinal: Nausea (4% to 6%), dyspepsia (3% to 5%), diarrhea (3% to 4%), constipation (3%)

Hepatic: ALT increased (monotherapy: 1%; coadministered with statin: 3%)

Neuromuscular & skeletal: Back pain (4% to 6%), pain in extremities (3% to 5%), arthralgia (4%), myalgia (3% to 4%), muscle spasm (2% to 3%)

Respiratory: Nasopharyngitis (4% to 5%), upper respiratory infection (4% to 5%), sinusitis (3% to 4%)

Additional adverse reactions when fenofibric acid coadministered with a statin (frequency not defined): AST increased, bronchitis, cough, CPK increased, hepatic enzymes increased, hypertension, influenza, insomnia, musculoskeletal pain, pharyngolaryngeal pain, urinary tract infection

Postmarketing (seen with fenofibrate): Abdominal pain, anemia, AST increased, cirrhosis, CPK increased, hepatitis, pancreatitis, renal failure, rhabdomyolysis, weakness

Monitoring ParametersPeriodic blood counts during first year of therapy; total cholesterol, LDL-C, triglycerides, and HDL-C should be measured periodically; monitor LFTs (including ALT) regularly and discontinue therapy if levels remain >3 times normal limits; serum creatinine (in patients with or at risk for renal impairment)
Monitoring: Lab TestsPeriodic blood counts during first year of therapy; total cholesterol, LDL-C, triglycerides, and HDL-C should be measured periodically; monitor LFTs (including ALT) regularly and discontinue therapy if levels remain >3 times normal limits; serum creatinine (in patients with or at risk for renal impairment)
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, delayed release:

TriLipix™: 45 mg, 135 mg

Generic AvailableNo
Mechanism of ActionFenofibric acid, an agonist for the nuclear transcription factor peroxisome proliferator-activated receptor-alpha (PPAR-alpha), downregulates apoprotein C-III (an inhibitor of lipoprotein lipase) and upregulates the synthesis of apolipoprotein A-I, fatty acid transport protein, and lipoprotein lipase resulting in an increase in VLDL catabolism, fatty acid oxidation, and elimination of triglyceride-rich particles; as a result of a decrease in VLDL levels, total plasma triglycerides are reduced by 30% to 60%; modest increased in HDL occurs in some hypertriglyceridemia patients.
Pharmacodynamics/Kinetics

Absorption: Well absorbed

Protein binding: ~99%

Metabolism: Fenofibric acid (active form) undergoes inactivation by glucuronidation. The choline salt dissociates in the GI tract to form fenofibric acid (free acid)

Bioavailability: ~81%

Half-life elimination: ~20 hours

Time to peak, plasma: 4-5 hours

Excretion: Urine (as fenofibric acid and fenofibric acid glucuronide)

Index Terms ABT-335; Choline Fenofibrate

Fenoldopam

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(fe NOL doe pam)
U.S. Brand NamesCorlopam®
Canadian Brand NamesCorlopam®
Pharmacologic CategoryDopamine Agonist
Use: Labeled IndicationsTreatment of severe hypertension (up to 48 hours in adults), including in patients with renal compromise; short-term (up to 4 hours) blood pressure reduction in pediatric patients
Dosing: AdultsHypertension, severe: I.V.: Initial: 0.1-0.3 mcg/kg/minute (lower initial doses may be associated with less reflex tachycardia); may be increased in increments of 0.05-0.1 mcg/kg/minute every 15 minutes until target blood pressure is reached; the maximal infusion rate reported in clinical studies was 1.6 mcg/kg/minute
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricHypertension, severe: I.V.: Initial: 0.2 mcg/kg/minute; may be increased to dosages of 0.3-0.5 mcg/kg/minute every 20-30 minutes (maximum dose: 0.8 mcg/kg/minute); limited to short-term (4 hours) use
Dosing: Renal ImpairmentNo guidelines are available.
Administration: I.V.For I.V. infusion using an infusion pump.
StorageStore at 2°C to 30°C (35°F to 86°F). Following dilution, store at room temperature and use solution within 24 hours.
ReconstitutionMust be diluted prior to infusion. Final dilution for children is 60 mcg/mL and for adults is 40 mcg/mL.
CompatibilityStable with NS or D_5W.
ContraindicationsHypersensitivity of fenoldopam or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Tachycardia: A dose-related tachycardia can occur, especially at infusion rates >0.1 mcg/kg/minute.

Disease-related concerns:

- Angina: Use with caution in patients with angina patients; can increase myocardial oxygen demand with tachycardia.
- Glaucoma: Use with caution in patients with open-angle glaucoma or intraocular hypertension.
- Increased intracranial pressure: Use with caution in patients with increased intracranial pressure; use has not been studied in this population.

Dosage form specific issues:

- Sulfites: Contains sulfites; may cause allergic reaction in susceptible individuals.

Other warnings/precautions:

- Administration: For continuous infusion only (no bolus doses).
- Hemodialysis: The effects of hemodialysis on the pharmacokinetics of fenoldopam have not been evaluated.
- Monitoring: Close monitoring of blood pressure is necessary; hypotension can occur. Monitor for hypokalemia at 6-hour intervals during infusion.

Pregnancy Risk FactorB
Pregnancy ConsiderationsFetal harm was not observed in animal studies; however, safety and efficacy have not been established for use during pregnancy. Use during pregnancy only if clearly needed. Fetal heart rate monitoring is recommended.
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsFrequency not always defined.

Cardiovascular: Angina, asymptomatic T wave flattening on ECG, chest pain, edema, facial flushing (>5%), fibrillation (atrial), flutter (atrial), hypotension (>5%), tachycardia

Central nervous system: Dizziness, headache (>5%)

Endocrine & metabolic: Hypokalemia

Gastrointestinal: Abdominal pain/fullness, diarrhea, nausea (>5%), vomiting, xerostomia

Local: Injection site reactions

Ocular: Intraocular pressure (increased), blurred vision

Hepatic: Increases in portal pressure in cirrhotic patients

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersBlood pressure, heart rate, ECG, renal/hepatic function tests

Reference RangeMean plasma fenoldopam levels after a 2 hour infusion (at 0.5 mcg/kg/minute) and a 100 mg dose is approximately 13 ng/mL and 50 ng/mL

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: 10 mg/mL (1 mL, 2 mL) [contains sodium metabisulfite and propylene glycol]

Generic AvailableYes

Mechanism of ActionA selective postsynaptic dopamine agonist (D_1-receptors) which exerts hypotensive effects by decreasing peripheral vasculature resistance with increased renal blood flow, diuresis, and natriuresis; 6 times as potent as dopamine in producing renal vasodilitation; has minimal adrenergic effects

Pharmacodynamics/Kinetics

Onset of action: I.V.: 10 minutes

Duration: I.V.: 1 hour

Distribution: V_d: 0.6 L/kg

Half-life elimination: I.V.: Children: 3-5 minutes; Adults: ~5 minutes

Metabolism: Hepatic via methylation, glucuronidation, and sulfation; the 8-sulfate metabolite may have some activity; extensive first-pass effect

Excretion: Urine (90%); feces (10%)

Pharmacotherapy PearlsSuitable for use in patients whose condition is unstable or rapidly changing because the effects of the drug are predictable and easily reversible; it has been found to safely control blood pressure in patients with a variety of pre-existing conditions including kidney disease, liver disease, and heart failure. (Clinical benefit other than blood pressure reduction has not been established.) In none of these situations does the dose need to be adjusted, minimizing the risk of drug overdose in patients with these conditions. The drug is quickly metabolized into inactive substances before it is excreted; therefore, there are no toxic chemicals derived from the drug. Unlike the situation with some other intravenous antihypertensives, the adult patient does not need an arterial line for blood pressure monitoring; a blood pressure cuff is sufficient to monitor blood pressure lowering. Since the drug induces natriuresis, diuresis, and increased creatinine clearance, it may have an advantage over nitroprusside, especially in patients with severe renal insufficiency and in volume overloaded patients.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentCauses hypotension; caution with low potency antipsychotics and TCAs

Cardiovascular Considerations

Contrast Nephropathy: Fenoldopam is ineffective in the prevention of contrast-induced nephropathy. A prospective, randomized trial (Allaqaband, 2002) compared the efficacy of acetylcysteine (600 mg twice daily for 48 hours) plus saline 0.45% to fenoldopam (0.1 mcg/kg/minute) plus saline 0.45% to saline alone (0.45% at 1 mL/kg/hour for 12 hours before procedure, during procedure, and 12 hours afterwards) in preventing radiocontrast-induced nephropathy. Patients were high-risk (serum creatinine >1.6 mg/dL or Cl_{cr} <60 mL/minute) and undergoing cardiovascular procedures using low-osmolality, nonionic contrast. Authors concluded that there was no benefit in either acetylcysteine or fenoldopam over saline in preventing radiocontrast-induced nephropathy.

In a more recent trial (CONTRAST), the efficacy of fenoldopam was evaluated to prevent contrast nephropathy after invasive cardiovascular procedures (Stone G, 2003). This was a prospective, placebo-controlled, double-blind, multicenter trial. Eligible patients were hydrated with 0.45% saline (1-1.5 mL/kg/hour for 2-12 hours prior to procedure) and randomized to fenoldopam (0.05 mcg/kg/minute; titrated to 0.1 mcg/kg/minute) or matching placebo, starting 1 hour before angiography and continuing for 12 hours. Contrast nephropathy was defined as a ≥25% increase in serum creatinine within 96 hours of procedure. One hundred and fifty seven patients received fenoldopam and 158 received placebo. Demographics were similar between the groups. Approximately 49% of patients were patients with diabetes. The average creatinine clearance was 29 mL/minute and 157 mL of contrast (low osmolar, 90% received nonionic) was administered. About half the patients in each group received acetylcysteine. Contrast-induced nephropathy occurred in 33.6% of fenoldopam patients and 30.1% of placebo patients (p: 0.61).

Anesthesia and Critical Care Concerns/Other ConsiderationsSuitable for use in patients whose condition is unstable or rapidly changing because the effects of the drug are predictable and easily reversible; it has been found to safely control blood pressure in patients with a variety of pre-existing conditions including kidney disease, liver disease, and heart failure. (Clinical benefit other than blood pressure reduction has not been established.) Dosage adjustment is not required in any of these situations. The drug is quickly metabolized into inactive substances before it is excreted. Unlike the situation with some other intravenous antihypertensives, the patient does not need an arterial line for blood pressure monitoring; a blood pressure cuff is sufficient. Since the drug induces natriuresis, diuresis, and increased creatinine clearance, it may have an advantage over nitroprusside, especially in patients with severe renal insufficiency and in volume-overloaded patients.

Contrast Nephropathy: Fenoldopam is ineffective in the prevention of contrast-induced nephropathy.

Index TermsFenoldopam Mesylate

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Fenoprofen may be confused with flurbiprofen

Nalfon® may be confused with Naldecon®

Pronunciation(fen oh PROE fen)

U.S. Brand NamesNalfon®

Canadian Brand NamesNalfon®

Pharmacologic CategoryNonsteroidal Anti-inflammatory Drug (NSAID), Oral

Use: Labeled IndicationsSymptomatic treatment of acute and chronic rheumatoid arthritis and osteoarthritis; relief of mild to moderate pain

Dosing: Adults

Rheumatoid arthritis, osteoarthritis: Oral: 300-600 mg 3-4 times/day; maximum dose: 3.2 g/day

Mild-to-moderate pain: Oral: 200 mg every 4-6 hours as needed; maximum dose: 3.2 g/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNot recommended in patients with advanced renal disease.

Administration: OralDo not crush tablets. Swallow whole with a full glass of water. Take with food to minimize stomach upset.

Dietary ConsiderationsMay be taken with food to decrease GI distress.

StorageStore at controlled room temperature of 20°C to 25°C (67°F to 77°F).

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an oral outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to fenoprofen, aspirin, or other NSAIDs, or any component of the formulation; perioperative pain in the setting of coronary artery bypass graft (CABG) surgery; significant renal dysfunction

Allergy Considerations

- Nonsteroidal Anti-inflammatory Drug (NSAID) Allergy

Warnings/Precautions

Boxed warnings:

- Cardiovascular events: See “Concerns related to adverse effects” below.
- Coronary artery bypass graft surgery: See “Disease-related concerns” below
- Gastrointestinal events: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Anaphylactoid reactions: Even in patients without prior exposure anaphylactoid reactions may occur; patients with "aspirin triad" (bronchial asthma, aspirin intolerance, rhinitis) may be at increased risk. Do not use in patients who experience bronchospasm, asthma, rhinitis, or urticaria with NSAID or aspirin therapy.
- Cardiovascular events: **[U.S. Boxed Warning]: NSAIDs are associated with an increased risk of adverse cardiovascular thrombotic events, including MI, stroke, and new onset or worsening of pre-existing hypertension.** Risk may be increased with duration of use or pre-existing cardiovascular risk factors or disease. Carefully evaluate individual cardiovascular risk profiles prior to prescribing. Use caution with fluid retention, heart failure, or hypertension. Concurrent administration of ibuprofen, and potentially other nonselective NSAIDs, may interfere with aspirin’s cardioprotective effect. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of cardiovascular events; alternate therapies should be considered for patients at high risk.
- Gastrointestinal events: **[U.S. Boxed Warning]: NSAIDs may increase risk of gastrointestinal irritation, inflammation, ulceration, bleeding, and perforation.** These events may occur at any time during therapy and without warning. Use caution with a history of GI disease (bleeding or ulcers), concurrent therapy with aspirin, anticoagulants and/or corticosteroids, smoking, use of alcohol, the elderly or debilitated patients. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of GI adverse events; alternate therapies should be considered for patients at high risk.
- Skin reactions: NSAIDs may cause serious skin adverse events including exfoliative dermatitis, Stevens-Johnson syndrome (SJS), and toxic epidermal necrolysis (TEN); discontinue use at first sign of skin rash or hypersensitivity.

Disease-related concerns:

- Asthma: Do not administer to patients with aspirin-sensitive asthma; severe bronchospasm may occur. Use caution in patients with other forms of asthma.

- Coronary artery bypass graft surgery: **[U.S. Boxed Warning]: Use is contraindicated for treatment of perioperative pain in the setting of coronary artery bypass graft (CABG) surgery.** Risk of MI and stroke may be increased with use following CABG surgery.

- Hepatic impairment: Use with caution in patients with decreased hepatic function. Closely monitor patients with any abnormal LFT. Severe hepatic reactions (eg, fulminant hepatitis, liver failure) have occurred with NSAID use, rarely; discontinue if signs or symptoms of liver disease develop, or if systemic manifestations occur.

- Renal impairment: NSAID use may compromise existing renal function; dose-dependent decreases in prostaglandin synthesis may result from NSAID use, reducing renal blood flow which may cause renal decompensation. Patients with impaired renal function, dehydration, heart failure, liver dysfunction, those taking diuretics, and ACE inhibitors, and the elderly are at greater risk of renal toxicity. Rehydrate patient before starting therapy; monitor renal function closely. Not recommended for use in patients with advanced renal disease. Long-term NSAID use may result in renal papillary necrosis.

Special populations:

- Elderly: The elderly are at increased risk for adverse effects (especially peptic ulceration, CNS effects, renal toxicity) from NSAIDs even at low doses.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Surgical/dental procedures: Withhold for at least 4-6 half-lives prior to surgical or dental procedures.

Geriatric ConsiderationsElderly are a high-risk population for adverse effects from NSAIDs. As much as 60% of elderly can develop peptic ulceration and/or hemorrhage asymptomatically. The concomitant use of H_2 blockers and sucralfate is not effective as prophylaxis with the exception of NSAID-induced duodenal ulcers which may be prevented by the use of ranitidine. Misoprostol and proton pump inhibitors are the only agents proven to help prevent the development of NSAID-induced ulcers. Also, concomitant disease and drug use contribute to the risk for GI adverse effects. Use lowest effective dose for shortest period possible. Consider renal function decline with age. Use of NSAIDs can compromise existing renal function especially when Cl_{cr} is ≤30 mL/minute. Tinnitus may be a difficult and unreliable indication of toxicity due to age-related hearing loss or eighth cranial nerve damage. CNS adverse effects such as confusion, agitation, and hallucination are generally seen in overdose or high-dose situations, but elderly may demonstrate these adverse effects at lower doses than younger adults.

Pregnancy Risk FactorC/D (3rd trimester)

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. Use of NSAIDs late in pregnancy may cause premature closure of the ductus arteriosis and may inhibit uterine contractions.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsVery low levels of fenoprofen are found in breast milk.

Adverse Reactions

1% to 10%:

Cardiovascular: Peripheral edema (5%), palpitation (3%)

Central nervous system: Headache (9%), somnolence (9%), dizziness (7%), nervousness (6%), fatigue (2%), confusion (1%)

Dermatologic: Itching (4%), rash (4%)

Gastrointestinal: Dyspepsia (10%), nausea (8%), constipation (7%), abdominal pain (2%), vomiting (3%)

Neuromuscular & skeletal: Weakness (5%), tremor (2%)

Ocular: Blurred vision (2%)

Otic: Tinnitus (5%), hearing decreased (2%)

Respiratory: Dyspnea (3%), nasopharyngitis (1%)

Miscellaneous: Diaphoresis (5%)

<1%, postmarketing, and/or case reports: Agranulocytosis, alkaline phosphatase increased, alopecia, anaphylaxis, angioedema (angioneurotic edema), anemia, anorexia, anuria, aphthous ulcerations, aplastic anemia, AST increased, atrial fibrillation, azotemia, blood in stool, bruising, burning tongue, cholestatic hepatitis, cystitis, depression, diplopia, disorientation, dysuria, exfoliative dermatitis, ECG changes, fever, flatulence, gastritis, gastrointestinal hemorrhage, gastrointestinal perforation, gastrointestinal ulcer, hematuria, hemolytic anemia, hemorrhage, hypertension, insomnia, interstitial nephritis, jaundice, LDH increased, lymphadenopathy, malaise, mastodynia, nephrosis, oliguria, optic neuritis, pancreatitis, pancytopenia, peptic ulcer, pulmonary edema, purpura, renal failure, renal papillary necrosis, seizure, Stevens-Johnson syndrome, supraventricular tachycardia, tachycardia, taste perversion, thrombocytopenia, toxic epidermal necrolysis, trigeminal neuralgia, urticaria, xerostomia

Drug Interactions

ACE Inhibitors: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Aminoglycosides: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Aminoglycosides. Data only in premature infants. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Angiotensin II Receptor

Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Anticoagulants: Nonsteroidal Anti-Inflammatory Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Antiplatelet Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

Beta-Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Nonsteroidal Anti-Inflammatory Agents. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Bisphosphonate Derivatives. Both an increased risk of gastrointestinal ulceration and an increased risk of nephrotoxicity are of concern. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

CycloSPORINE: Nonsteroidal Anti-Inflammatory Agents may enhance the nephrotoxic effect of CycloSPORINE. Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

Desmopressin: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Eplerenone: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Eplerenone. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk D: Consider therapy modification*

HydrALAZINE: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of HydrALAZINE. *Risk C: Monitor therapy*

Ketorolac: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. *Risk X: Avoid combination*

Lithium: Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the diuretic effect of Loop Diuretics. *Risk C: Monitor therapy*

Methotrexate: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Methotrexate. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of other Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Pemetrexed: NSAID (Nonselective) may decrease the excretion of Pemetrexed. *Risk D: Consider therapy modification*

Probenecid: May increase the serum concentration of Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: Nonsteroidal Anti-Inflammatory Agents may enhance the neuroexcitatory and/or seizure-potentiating effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Salicylates: NSAID (Nonselective) may enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Choline Magnesium Trisalicylate. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk D: Consider therapy modification*

Thiazide Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Thrombolytic Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk C: Monitor therapy*

Vancomycin: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Vancomycin. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): NSAID (Nonselective) may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may enhance gastric mucosal irritation).

Food: Fenoprofen peak serum levels may be decreased if taken with food; total amount absorbed is not affected.

Herb/Nutraceutical: Avoid alfalfa, anise, bilberry, bladderwrack, bromelain, cat's claw, celery, chamomile, coleus, cordyceps, dong quai, evening primrose, fenugreek, feverfew, garlic, ginger, ginkgo biloba, ginseng (American, Panax, Siberian), grapeseed, green tea, guggul, horse chestnut seed, horseradish, licorice, prickly ash, red clover, reishi, SAMe (S-adenosylmethionine), sweet clover, turmeric, white willow (all have additional antiplatelet activity).

Test InteractionsFenoprofen may interfere with Amerlex-M kit assay values; falsely elevated values of total and free triiodothyronine have been reported.

Monitoring ParametersMonitor CBC, liver enzymes; monitor urine output and BUN/serum creatinine in patients receiving diuretics; monitor blood pressure in patients receiving antihypertensives; audiogram (in patients with baseline hearing impairment)

Reference RangeTherapeutic: 20-65 mcg/mL (SI: 82-268 µmol/L)

Nursing: Physical Assessment/MonitoringEvaluate cardiac risk and potential for GI bleeding prior to prescribing this medication. Assess effectiveness and interactions of other medications patient may be taking. Monitor blood pressure at the beginning of therapy and periodically during use. Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions at beginning of therapy and periodically throughout therapy. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsCBC, liver enzymes; urine output and BUN/serum creatinine in patients receiving diuretics

Patient EducationTake this medication exactly as directed; do not increase dose without consulting prescriber. Do not crush tablets or break capsules. Take with food or milk to reduce GI distress. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Do not use alcohol, aspirin or aspirin-containing medication, or any other anti-inflammatory medications without consulting prescriber. You may experience drowsiness, dizziness, nervousness, or headache (use caution when driving or engaging in tasks requiring alertness until response to drug is known); anorexia, nausea, vomiting, or heartburn (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or fluid retention (weigh yourself weekly and report unusual [3-5 pounds/week] weight gain). GI bleeding, ulceration, or perforation can occur with or without pain; discontinue medication and contact prescriber if persistent abdominal pain or cramping, or blood in stool occurs. Report breathlessness, respiratory difficulty, or unusual cough; chest pain, rapid heartbeat, palpitations; unusual bruising/bleeding; blood in urine, stool, mouth, or vomitus; swollen extremities; skin rash or itching; acute fatigue; weakness in one side or part of body; slurred speech; persistent nausea; yellowing of skin or eyes; abdominal pain; or hearing changes (ringing in ears). **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. This drug should not be used in the 3rd trimester of pregnancy. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, as calcium:

Nalfon®: 200 mg

Tablet, as calcium: 600 mg

Generic AvailableYes: Tablet

Pricing: U.S. (www.drugstore.com)

Capsules (Nalfon)

200 mg (100): $69.99

Tablets (Fenoprofen Calcium)

600 mg (30): $21.99

Mechanism of ActionReversibly inhibits cyclooxygenase-1 and 2 (COX-1 and 2) enzymes, which result in decreased formation of prostaglandin precursors; has antipyretic, analgesic, and anti-inflammatory properties

Pharmacodynamics/Kinetics

Onset of action: A few days; full benefit: up to 2-3 weeks

Absorption: Rapid, 80%

Protein binding: 99%; to albumin

Metabolism: Extensively hepatic

Half-life elimination: 2.5-3 hours

Time to peak, serum: ~2 hours

Excretion: Urine (2% to 5% as unchanged drug); feces (small amounts)

Related Information

- Nonsteroidal Anti-inflammatory Agents

Dental Health: Effects on Dental TreatmentNSAID formulations are known to reversibly decrease platelet aggregation via mechanisms different than observed with aspirin. The dentist should be aware of the potential of abnormal coagulation. Caution should also be exercised in the use of NSAIDs in patients already on anticoagulant therapy with drugs such as warfarin (Coumadin®).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness is common; may cause nervousness; rarely may cause insomnia, confusion, depression, or hallucinations

Mental Health: Effects on Psychiatric TreatmentMay rarely cause may agranulocytosis; use caution with clozapine and carbamazepine; may decrease the clearance of lithium resulting in elevated serum levels and potential toxicity; monitor serum lithium levels; use acetaminophen, if possible, for pain

Cardiovascular Considerations

Blood Pressure: In short-term use, NSAIDs vary considerably in their effect on blood pressure. A meta-analysis (Pope, 1993) showed that indomethacin and naproxen had the largest effect on blood pressure. Other NSAIDs, including piroxicam, ibuprofen, and sulindac had less of an effect. Ibuprofen combined with captopril or losartan may attenuate the antihypertensive effects of ACE inhibition or receptor blockade on sitting or 24-hour ambulatory diastolic blood pressure. When NSAIDs are used in patients with hypertension, appropriate monitoring of blood pressure responses should be completed and the duration of therapy, when possible, kept short.

Heart Failure: The use of NSAIDs in the treatment of patients with congestive heart failure may be associated with an increased risk for fluid accumulation and edema. One study showed that NSAID use in elderly patients had an increased risk of hospitalization for heart failure. This study gives compelling reasons to avoid or limit the use of NSAIDs in patients with congestive heart failure, particularly in the elderly population. The ACC/AHA 2005 chronic heart failure guidelines suggest that NSAIDs be avoided or withdrawn whenever possible in patients with current or prior symptoms of heart failure and reduced LVEF.

Risk of Cardiovascular Events: Patients at increased risk of cardiovascular adverse events include patients immediately postoperative (10-14 days) from CABG surgery, and those with existing CAD, CVD, or history of TIA. Prescribers are encouraged to use the lowest effective dose for the shortest duration of time based on individual patient treatment goals. Available evidence reviewed by the FDA does not suggest an increased risk of serious CV events when NSAIDs are given short term and in the lower doses used OTC.

Drug Interactions: Nonsteroidal anti-inflammatory agents, including ibuprofen and naproxen, may diminish the cardioprotective effect of aspirin (Catella-Lawson F, 2001; Capone ML, 2005). It is surmised that ibuprofen may exhibit greater affinity than aspirin for the COX-1 site or if dosed regularly (or prior to aspirin), it would gain access to the active site first. In either case, aspirin’s inhibition of COX (irreversible) would be limited in favor of ibuprofen inhibition (reversible). Avoid regular use of NSAIDs (nonselective) if possible. If used occasionally, take after aspirin (immediate release) ingestion.

Anesthesia and Critical Care Concerns/Other ConsiderationsThe 2002 ACCM/SCCM guidelines for analgesia (critically-ill adult) suggest that NSAIDs may be used in combination with opioids in select patients for pain management. Concern about adverse events (increased risk of renal dysfunction, altered platelet function and gastrointestinal irritation) limits its use in patients who have other underlying risks for these events.

In short-term use, NSAIDs vary considerably in their effect on blood pressure. When NSAIDs are used in patients with hypertension, appropriate monitoring of blood pressure responses should be completed and the duration of therapy, when possible, kept short. The use of NSAIDs in the treatment of patients with congestive heart failure may be associated with an increased risk for fluid accumulation and edema. May precipitate renal failure in dehydrated patients.

Index TermsFenoprofen Calcium

English

Jump To Field (Select Field Name)

Pronunciation(fen oh TER ole)

Canadian Brand NamesBerotec®

Pharmacologic CategoryBeta$_2$ Agonist

Use: Labeled IndicationsTreatment and prevention of symptoms of reversible obstructive pulmonary disease (including asthma and acute bronchospasm), chronic bronchitis, emphysema

Dosing: Adults

Bronchospasm: Inhalation:

Metered dose inhaler (MDI):

Acute treatment: 1 puff initially; may repeat in 5 minutes; if relief is not evident, additional doses and/or other therapy may be necessary

Intermittent/long-term treatment: 1-2 puffs 3-4 times/day (maximum of 8 puffs/24 hours)

Inhalation solution: 0.5-1 mg (up to maximum of 2.5 mg)

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricChildren ≥12 years of age: Refer to adult dosing

Administration: Inhalation

MDI: Shake well before use; prime prior to first use, and whenever inhaler has not been used for >2 weeks, by releasing 4 test sprays into the air (away from face)

Solution: Appropriate dose may be diluted with sterile, preservative-free 0.9% sodium chloride to allow nebulization.

Storage

Aerosol: Store at 15°C to 30°C (59°F to 86°F).

Solution:

Unopened unit-dose vial: Store at room temperature of ~25°C (77°F). Protect from light.

Undiluted, opened (original glass amber bottle, recapped): May be stored at room temperature of ~25°C (77°F) for 30 days.

Diluted with preservative-free normal saline: May be stored at room temperature of ~25°C (77°F) for 24 hours.

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to fenoterol or any component of the formulation; tachyarrhythmias; hypertrophic obstructive cardiomyopathy

Warnings/Precautions

Concerns related to adverse effects:

- Bronchospasm: Rarely, paradoxical bronchospasm may occur with use of inhaled bronchodilating agents; this should be distinguished from inadequate response.
- Hypersensitivity reactions: Immediate hypersensitivity reactions (urticaria, angioedema, rash, bronchospasm) have been reported.
- Serious effects/fatalities: Do not exceed recommended dose; serious adverse events, including fatalities, have been associated with excessive use of inhaled sympathomimetics.

Disease-related concerns:

- Asthma: Appropriate use: Optimize anti-inflammatory treatment before initiating maintenance treatment with fenoterol. Do not use as a component of chronic therapy without an anti-inflammatory agent. Only the mildest forms of asthma (Step 1 and/or exercise-induced) would not require concurrent use based upon asthma guidelines.
- Cardiovascular disease: Use with caution in patients with cardiovascular disease (arrhythmia or hypertension or HF); beta-agonists may cause elevation in blood pressure, heart rate and result in CNS stimulation/excitation. Beta$_2$-agonists may also increase risk of arrhythmias.
- Diabetes: Use with caution in patients with diabetes mellitus; beta$_2$-agonists may increase serum glucose.
- Glaucoma: Use with caution in patients with glaucoma; may elevate intraocular pressure.

- Hyperthyroidism: Use with caution in hyperthyroidism; may stimulate thyroid activity.
- Hypokalemia: Use with caution in patients with hypokalemia; beta$_2$ agonists may decrease serum potassium.
- Seizures: Use with caution in patients with seizure disorders; beta-agonists may result in CNS stimulation/excitation.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Other warnings/precautions:

- Patient information: Patients must be instructed to seek medical attention in cases where acute symptoms are not relieved or a previous level of response is diminished. The need to increase frequency of use may indicate deterioration of asthma, and treatment must not be delayed. All patients should utilize a spacer device when using a metered-dose inhaler.

Pregnancy Risk FactorNot available; similar agents rated C

Pregnancy ConsiderationsSafety and efficacy have not been established in pregnant women. Because of a potential for beta$_2$-agonists to interfere with uterine contractility, use should be restricted to cases where the benefit clearly outweighs the potential risks.

LactationEnters breast milk/not recommended

Adverse Reactions**Note:** Frequency of most effects may be dose related, approximate frequencies noted below. In the treatment of acute bronchospasm (high-dose nebulization), symptoms of headache (up to 12%), tremor (32%), and tachycardia (up to 21%) are frequently noted.

>10%: Endocrine & metabolic: Serum glucose increased, serum potassium decreased

1% to 10%:

Cardiovascular: Palpitation, tachycardia

Central nervous system: Headache, dizziness, nervousness

Neuromuscular & skeletal: Tremor, muscle cramps

Respiratory: Pharyngeal irritation, cough

<1%: Agitation, allergic reaction, arrhythmia, bronchospasm (paradoxical), hyperglycemia, hypertension, nausea, pruritus, rash, restlessness, sleep disorder, tachycardia, urticaria, vomiting

Postmarketing and/or case reports: Hypokalemia

Drug Interactions

Alpha-/Beta-Blockers: May diminish the therapeutic effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Atomoxetine: May enhance the tachycardic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Beta-Blockers (Beta1 Selective): May diminish the bronchodilatory effect of Beta2-Agonists. Of particular concern with nonselective beta-blockers or higher doses of the beta1 selective beta-blockers. *Risk C: Monitor therapy*

Beta-Blockers (Nonselective): May diminish the bronchodilatory effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Betahistine: May diminish the therapeutic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Avoid or limit caffeine (may cause CNS stimulation).

Herb/Nutraceutical: Avoid ephedra, yohimbe (may cause CNS stimulation).

Monitoring ParametersFEV$_1$, peak flow, and/or other pulmonary function tests; blood pressure, heart rate; CNS stimulation; serum glucose, serum potassium; asthma symptoms; arterial or capillary blood gases (if patients condition warrants)

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking (see Drug Interactions). See Contraindications and Warnings/Precautions for use cautions. Monitor vital signs, effectiveness of therapy, and adverse reactions (see Adverse Reactions) at beginning of therapy and periodically with long-term use. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report (see Patient Education). **Pregnancy risk factor C** - benefits of use should outweigh possible risks. Breast-feeding is not recommended.

Monitoring: Lab TestsArterial or capillary blood gases (if patient's condition warrants); FEV$_1$, peak flow, and/or other pulmonary function tests; serum potassium, serum glucose (in selected patients)

Patient EducationUse exactly as directed. Do not use more often than recommended. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience nervousness, dizziness, or fatigue (use caution when driving or engaging in hazardous activities until response to drug is known); dry mouth, unpleasant taste, stomach upset (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or difficulty urinating (always void before treatment). Report unresolved GI upset, dizziness or fatigue, vision changes, chest pain or palpitations, persistent inability to void, nervousness or insomnia, muscle cramping or tremor, or unusual cough. If usual dose does not provide relief or if relief does not last at least 3 hours, medical advice should be sought immediately. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Self-administered inhalation: Do not freeze. Shake canister before using. Sit when using medication. Close eyes when administering fenoterol to avoid spray getting into eyes. Exhale slowly and completely through nose; inhale deeply through mouth while administering aerosol. Hold breath for 10 seconds after inhalation. Wait at least 1 full minute between inhalations. Wash mouthpiece between use. If more than one inhalation medication is used, use fenoterol first and wait 5 minutes between medications. Prime inhaler prior to first use, and whenever the inhaler has not been used for more than 2 weeks, by releasing 4 test sprays into the air (away from face). Discard inhaler after labeled number of doses are used, even if the canister does not feel empty. Store with mouthpiece down. Do not allow metal canister to become wet.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Aerosol for inhalation, as hydrobromide: MDI:

Berotec® [CAN]: 100 mcg/dose [200 doses]

Solution for inhalation, as hydrobromide:

Berotec® [CAN] 0.625 mg/mL (2 mL); 0.25 mg/mL (2 mL) [not available in the U.S.]

ManufacturerBoehringer Ingelheim (Canada)

Mechanism of ActionRelaxes bronchial smooth muscle by action on beta$_2$-receptors with little effect on heart rate.

Pharmacodynamics/Kinetics

Onset of action: 5 minutes

Peak effect: 30-60 minutes

Duration: 3-4 hours (up to 6-8 hours)

Pharmacotherapy PearlsNot available in U.S.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause nervousness, dizziness, or fatigue

Mental Health: Effects on Psychiatric TreatmentUse caution with TCAs and MAO inhibitors; concomitant use with fenoterol may increase the adverse effects of fenoterol.

Index TermsFenoterol Hydrobromide

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

Fentanyl Transdermal System Patches: Leakage of Active Gel - Revised August 2008

Various manufacturers of fentanyl transdermal system patches have instituted recalls of fentanyl transdermal patch products due to manufacturing defects resulting in fentanyl gel leakage from the patch. Leakage of active drug out of the patch renders the transdermal system less effective and could potentially expose patients, caregivers, and/or healthcare practitioners handling the products to fentanyl gel. Patients and healthcare professionals should check the drug packaging for affected lots and are advised against directly handling any defective patches. Recommended guidance for product returns and/or disposal should be followed. Anyone exposed to the gel should immediately rinse exposed skin with large amounts of water without using soap or detergents.

For further information regarding specific strengths and lot numbers affected it the U.S. recalls, refer to the following FDA websites:

http://www.fda.gov/medwatch/safety/2008/safety08.htm#Fentanyl

http://www.fda.gov/medwatch/safety/2008/safety08.htm#Duragesic

For information regarding defective patches sold in Canada by Janssen-Ortho, Inc or Ranbaxy see:

http://www.hc-sc.gc.ca/ahc-asc/media/advisories-avis/_2008/2008_29_e.html

Medication Safety Issues

Sound-alike/look-alike issues:

FentaNYL may be confused with alfentanil, SUFentanil

Dosing of transdermal fentanyl patches may be confusing. Transdermal fentanyl patches should always be prescribed in mcg/hour, not size. Patch dosage form of Duragesic®-12 actually delivers 12.5 mcg/hour of fentanyl. Use caution, as orders may be written as “Duragesic 12.5” which can be erroneously interpreted as a 125 mcg dose.

Fentora® and Actiq® are not interchangeable; do not substitute doses on a mcg-per-mcg basis.

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Fentanyl transdermal system patches: Leakage of fentanyl gel from the patch has been reported; patch may be less effective; do not use. Thoroughly wash any skin surfaces coming into direct contact with gel with water (do not use soap).

Transdermal patch (eg, Duragesic®) does not contain any metal-based compounds; however, the printed ink used to indicate strength on the outer surface of the patch does contain titanium dioxide, but the amount is minimal.

Pronunciation(FEN ta nil)

U.S. Brand NamesActiq®; Duragesic®; Fentora®; Sublimaze®

Canadian Brand NamesActiq®; Duragesic®; Fentanyl Citrate Injection, USP; RAN™-Fentanyl Transdermal System; ratio-Fentanyl

Pharmacologic CategoryAnalgesic, Opioid; Anilidopiperidine Opioid; General Anesthetic

Use: Labeled Indications

Injection: Sedation, relief of pain, preoperative medication, adjunct to general or regional anesthesia

Transdermal patch (eg, Duragesic®): Management of persistent moderate-to-severe chronic pain

Transmucosal lozenge (eg, Actiq®), buccal tablet (Fentora®): Management of breakthrough cancer pain in opioid-tolerant patients

Use: DentalAdjunct in preoperative intravenous conscious sedation in patients undergoing dental surgery

Dosing: Adults**Note:** These are guidelines and do not represent the maximum doses that may be required in all patients. Doses and dosage intervals should be titrated to pain relief/prevention. Monitor vital signs routinely. Single I.M. doses have a duration of 1-2 hours, single I.V. doses last 0.5-1 hour.

Surgery:

Premedication: I.M., slow I.V.: 50-100 mcg/dose 30-60 minutes prior to surgery

Adjunct to regional anesthesia: Slow I.V.: 25-100 mcg/dose over 1-2 minutes. **Note:** An I.V. should be in place with regional anesthesia so the I.M. route is rarely used but still maintained as an option in the package labeling.

Adjunct to general anesthesia: Slow I.V.:

Low dose: 0.5-2 mcg/kg/dose depending on the indication.

Moderate dose: Initial: 2-20 mcg/kg/dose; Maintenance (bolus or infusion): 1-2 mcg/kg/hour. Discontinuing fentanyl infusion 30-60 minutes prior to the end of surgery will usually allow adequate ventilation upon emergence from anesthesia. For "fast-tracking" and early extubation following major surgery, total fentanyl doses are limited to 10-15 mcg/kg.

High-dose: 20-50 mcg/kg/dose; **Note:** Fentanyl is rarely used, but is still maintained in the package labeling.

Pain management: Adults:

I.V. (unlabeled use): Bolus at start of infusion: 1-2 mcg/kg **or** 25-100 mcg/dose; continuous infusion rate: 1-2 mcg/kg/hour **or** 25-200 mcg/hour

Severe (unlabeled use): I.M, I.V.: 50-100 mcg/dose every 1-2 hours as needed; patients with prior opiate exposure may tolerate higher initial doses

Patient-controlled analgesia (PCA) (unlabeled use): I.V.: Usual concentration: 10 mcg/mL

Basal rate: ≤50 mcg/hour

Demand dose: Usual: 10 mcg; range: 10-50 mcg

Lockout interval: 5-10 minutes

Critically-ill patients (unlabeled dose): Slow I.V.: 25-100 mcg (based on ~70 kg patient) **or** 0.35-1.5 mcg/kg every 30-60 minutes as needed. **Note:** More frequent dosing may be needed (eg, mechanically-ventilated patients).

Continuous infusion: 50-700 mcg/hour (based on ~70 kg patient) **or** 0.7-10 mcg/kg/hour

Breakthrough cancer pain: For patients who are tolerant to and currently receiving opioid therapy for persistent cancer pain; dosing should be individually titrated to provide adequate analgesia with minimal side effects. Dose titration should be done if patient requires more than 1 dose/breakthrough pain episode for several consecutive episodes. Patients experiencing >4 breakthrough pain episodes/day should have the dose of their long-term opioid re-evaluated.

Lozenge: Initial dose: 200 mcg; the second dose may be started 15 minutes after completion of the first dose. Consumption should be limited to ≤4 units/day. Additional requirements suggest need for improved baseline therapy.

Buccal tablet (Fentora®): Initial dose: 100 mcg; a second 100 mcg dose, if needed, may be started 30 minutes after the start of the first dose. **Note:** For patients previously using the transmucosal lozenge (Actiq®), the initial dose should be selected using the conversions listed below (maximum: 2 doses per breakthrough pain episode every 4 hours).

Dose titration, if required, should be done using multiples of the 100 mcg tablets. Patient can take two 100 mcg tablets (one on each side of mouth). If that dose is not successful, can use four 100 mcg tablets (two on each side of mouth). If titration requires >400 mcg/dose, then use 200 mcg tablets.

Conversion from lozenge to buccal tablet (Fentora®):

Lozenge dose 200-400 mcg, then buccal tablet 100 mcg

Lozenge dose 600-800 mcg, then buccal tablet 200 mcg

Lozenge dose 1200-1600 mcg, then buccal tablet 400 mcg

Note: Four 100 mcg buccal tablets deliver approximately 12% and 13% higher values of C_{max} and AUC, respectively, compared to one 400 mcg buccal tablet. To prevent confusion, patient should only have one strength available at a time. Using more than four buccal tablets at a time has not been studied.

Chronic pain management: Children ≥2 years and Adults (opioid-tolerant patients): Transdermal patch (eg, Duragesic®):

Initial: To convert patients from oral or parenteral opioids to transdermal patch, a 24-hour analgesic requirement should be calculated (based on prior opiate use). Using the tables, the appropriate initial dose can be determined. The initial fentanyl dosage may be approximated from the 24-hour morphine dosage equivalent and titrated to minimize adverse effects and provide analgesia. With the initial application, the absorption of transdermal fentanyl requires several hours to reach plateau; therefore transdermal fentanyl is inappropriate for management of acute pain. Change patch every 72 hours.

Conversion from continuous infusion of fentanyl: In patients who have adequate pain relief with a fentanyl infusion, fentanyl may be converted to transdermal dosing at a rate equivalent to the intravenous rate. A two-step taper of the infusion to be completed over 12 hours has been recommended (Kornick, 2001) after the patch is applied. The infusion is decreased to 50% of the original rate six hours after the application of the first patch, and subsequently discontinued twelve hours after application.

Titration: Short-acting agents may be required until analgesic efficacy is established and/or as supplements for "breakthrough" pain. The amount of supplemental doses should be closely monitored. Appropriate dosage increases may be based on daily supplemental dosage using the ratio of 45 mg/24 hours of oral morphine to a 12.5 mcg/hour increase in fentanyl dosage.

Frequency of adjustment: The dosage should not be titrated more frequently than every 3 days after the initial dose or every 6 days thereafter. Patients should wear a consistent fentanyl dosage through two applications (6 days) before dosage increase based on supplemental opiate dosages can be estimated. **Note:** Upon discontinuation, ~17 hours are required for a 50% decrease in fentanyl levels.

Frequency of application: The majority of patients may be controlled on every 72-hour administration; however, a small number of patients require every 48-hour administration.

Dose conversion guidelines for transdermal fentanyl[1] (see tables).

Recommended Initial Duragesic® Dose Based Upon Daily Oral Morphine Dose[1]

Oral 24-Hour Morphine (mg/d)	**Duragesic® Dose (mcg/h)**
60-134[2]	25
135-224	50
225-314	75
315-404	100
405-494	125
495-584	150
585-674	175
675-764	200
765-854	225
855-944	250
945-1034	275
1035-1124	300
[1]The table should NOT be used to convert from transdermal fentanyl (eg, Duragesic®) to other opioid analgesics. Rather, following removal of the patch, titrate the dose of the new opioid until adequate analgesia is achieved.	
[2]Pediatric patients initiating therapy on a 25 mcg/hour Duragesic® system should be opioid-tolerant and receiving at least 60 mg oral morphine equivalents per day.	

Dosing Conversion Guidelines[1,2]

Current Analgesic	**Daily Dosage (mg/day)**			
Morphine (I.M./I.V.)	10-22	23-37	38-52	53-67
Oxycodone (oral)	30-67	67.5-112	112.5-157	157.5-202
Oxycodone (I.M./I.V.)	15-33	33.1-56	56.1-78	78.1-101

Codeine (oral)	150-447	448-747	748-1047	1048-1347
Hydromorphone (oral)	8-17	17.1-28	28.1-39	39.1-51
Hydromorphone (I.V.)	1.5-3.4	3.5-5.6	5.7-7.9	8-10
Meperidine (I.M.)	75-165	166-278	279-390	391-503
Methadone (oral)	20-44	45-74	75-104	105-134
Methadone (I.M.)	10-22	23-37	38-52	53-67
Fentanyl transdermal recommended dose (mcg/h)	**25 mcg/h**	**50 mcg/h**	**75 mcg/h**	**100 mcg/h**

[1] The table should NOT be used to convert from transdermal fentanyl (eg, Duragesic®) to other opioid analgesics. Rather, following removal of the patch, titrate the dose of the new opioid until adequate analgesia is achieved.

[2] Duragesic® product insert, Janssen Pharmaceutica, Feb 2008.

Opioid Analgesics Initial Oral Dosing Commonly Used for Severe Pain

Drug	**Equianalgesic Dose (mg)**		**Initial Oral Dose**	
	Oral[1]	**Parenteral[2]**	**Children (mg/kg)**	**Adults (mg)**
Buprenorphine	—	0.4	—	—
Butorphanol	—	2	—	—

Oxymorphone	—	1	—	—

From “Principles of Analgesic Use in the Treatment of Acute Pain and Cancer Pain,” *Am*

Pain Soc, Fifth Ed.
[1] Elderly: Starting dose should be lower for this population group
[2] Standard parenteral doses for acute pain in adults; can be used to doses for I.V. infusions and repeated small I.V. boluses. Single I.V. boluses, use half the I.M. dose. Children >6 months: I.V. dose = parenteral equianalgesic dose x weight (kg)/100

Dosing: ElderlyElderly have been found to be twice as sensitive as younger patients to the effects of fentanyl. A wide range of doses may be used. When choosing a dose, take into consideration the following patient factors: age, weight, physical status, underlying disease states, other drugs used, type of anesthesia used, and the surgical procedure to be performed.

Transmucosal lozenge (eg, Actiq®): In clinical trials, patients who were >65 years of age were titrated to a mean dose that was 200 mcg less than that of younger patients.

Dosing: Pediatric**Note:** These are guidelines and do not represent the maximum doses that may be required in all patients. Doses and dosage intervals should be titrated to pain relief/prevention. Monitor vital signs routinely. Single I.M. doses have a duration of 1-2 hours, single I.V. doses last 0.5-1 hour.

Adjunct to anesthesia (induction and maintenance): Children ≥2 years: I.V.: 2-3 mcg/kg/dose every 1-2 hours as needed

Pain management (unlabeled use): I.V.: 0.5-2 mcg/kg/dose given every 1-2 hours as needed; continuous infusion: 0.5-2 mcg/kg/hour; titrate to desired effects

Chronic pain management: Children ≥2 years (opioid-tolerant patients): Transdermal patch: Refer to adult dosing.

Minor procedures/analgesia (unlabeled use): I.V.:

Children 1-12 years: 0.5-2 mcg/kg/dose given 3 minutes prior to procedure; may repeat every 1-2 hours

Children >12 years: 0.5-2 mcg/kg/dose (maximum 50 mcg/dose) given 3 minutes prior to procedure; may repeat in 5 minutes if necessary; if more than 2 doses are needed, repeat with a maximum of 25 mcg/dose up to 5 times

Continuous sedation/analgesia: 0.5-2 mcg/kg/hour; titrate to desired effect

Breakthrough cancer pain: Children ≥16 years: Transmucosal lozenge: Refer to adult dosing.

Dosing: Hepatic ImpairmentFentanyl kinetics may be altered in hepatic disease.

Calculations

- Fentanyl
- Fentanyl Transdermal Conversion
- Opioid Agonist Conversion

Administration: I.V.Administer as slow I.V. infusion over 1-2 minutes. May also be administered as continuous infusion or PCA (unlabeled use) routes. Muscular rigidity may occur with rapid I.V. administration.

Administration: I.V. DetailpH: 4.0-7.5

Administration: Oral

Lozenge: Foil overwrap should be removed just prior to administration. Place the unit in mouth and allow it to dissolve. Do not chew. Lozenge may be moved from one side of the mouth to the other. The unit should be consumed over a period of 15 minutes. Handle should be removed after it is consumed or if patient has achieved an adequate response and/or shows signs of respiratory depression.

Buccal tablet: Patient should not open blister until ready to administer. The blister backing should be peeled back to expose the tablet; tablet should not be pushed out through the blister. Immediately use tablet once removed from blister. Place entire tablet in the buccal cavity (above a rear molar, between the upper cheek and gum). Tablet should not be broken, sucked, chewed, or swallowed. Should dissolve in about 14-25 minutes when left between the cheek and the gum. If remnants remain they may be swallowed with water.

Administration: TopicalTransdermal patch (eg, Duragesic®): Apply to nonirritated and nonirradiated skin, such as chest, back, flank, or upper arm. Do not shave skin; hair at application site should be clipped. Prior to application, clean site with clear water and allow to dry completely. Do not use damaged, cut or leaking patches; patch may be less effective. Skin exposure from fentanyl gel leaking from patch may lead to serious adverse effects; thoroughly wash affected skin surfaces with water (do not use soap). Firmly press in place and hold for 30 seconds. Change patch every 72 hours. Do **not** use soap, alcohol, or other solvents to remove transdermal gel if it accidentally touches skin; use copious amounts of water. Avoid exposing application site to external heat sources (eg, heating pad, electric blanket, heat lamp, hot tub).

Dietary ConsiderationsTransmucosal lozenge contains 2 g sugar per unit.

Storage

Injection formulation: Store at controlled room temperature of 20°C to 25°C (68°F to 77°F). Protect from light.

Transdermal patch: Do not store above 25°C (77°F).

Transmucosal (buccal tablets, lozenge): Store at controlled room temperature of 20°C to 25°C (68°F to 77°F). Protect from freezing and moisture.

CompatibilityStable in D_5W, NS.

Y-site administration: Compatible: Alatrofloxacin, amphotericin B cholesteryl sulfate complex, atracurium, cisatracurium, diltiazem, dobutamine, dopamine, enalaprilat, epinephrine, esmolol, etomidate, furosemide, gatifloxacin, heparin, hydrocortisone sodium succinate, hydromorphone, labetalol, levofloxacin, linezolid, lorazepam, midazolam, milrinone, morphine, nafcillin, nicardipine, nitroglycerin, norepinephrine, pancuronium, potassium chloride, propofol, ranitidine, remifentanil, sargramostim, thiopental, vecuronium, vitamin B complex with C.

Compatibility in syringe: Compatible: Atracurium, atropine, bupivacaine with ketamine, butorphanol, chlorpromazine, cimetidine, clonidine with lidocaine, dimenhydrinate, diphenhydramine, droperidol, heparin, hydromorphone, hydroxyzine, meperidine, metoclopramide, midazolam, morphine, ondansetron, pentazocine, perphenazine, prochlorperazine edisylate, promazine, promethazine, ranitidine, scopolamine. **Incompatible:** Pentobarbital.

Compatibility when admixed: Compatible: Bupivacaine. **Incompatible:** Fluorouracil, methohexital, pentobarbital, thiopental.

Restrictions C-II

An FDA-approved medication guide for buccal tablet (Fentora®), transmucosal lozenge (eg, Actiq®), and transdermal patch (eg, Duragesic®) must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

Contraindications Hypersensitivity to fentanyl or any component of the formulation

Transdermal system: Severe respiratory disease or depression including acute asthma (unless patient is mechanically ventilated); paralytic ileus; patients requiring short-term therapy, management of intermittent pain

Transmucosal buccal tablets (Fentora®), lozenges (eg, Actiq®), and/or transdermal patches (eg, Duragesic®): Contraindicated in the management of acute or postoperative pain and in patients who are not opioid tolerant

Allergy Considerations

- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Boxed warnings:

- Abuse/misuse/diversion: See “Other warnings/precautions” below.
- Transmucosal: See “Dosage form specific issues” and "Concurrent drug therapy issues" below.
- Transdermal patches: See “Special populations" and "Dosage form specific issues” below.

Concerns related to adverse effects:

- Opioid agonist toxicities: Shares the toxic potentials of opiate agonists, and precautions of opiate agonist therapy should be observed.
- Opioid-nontolerant patients should not receive some formulations/strengths of fentanyl, including buccal tablets (Fentora®), lozenges (Actiq®), or transdermal patches. Patients are considered opioid-tolerant if they have been receiving at least:

  60 mg of oral morphine/day, **or**

  25 mcg of transdermal fentanyl/hour, **or**

  30 mg of oxycodone/day, **or**

  8 mg oral hydromorphone/day, **or**

  Equianalgesic dose of another opioid for at least 1 week.
- Respiratory depression: **[U.S. Boxed Warning] Actiq®, Duragesic®, Fentora®: May cause potentially life-threatening hypoventilation, respiratory depression, and/or death;** Actiq®, Duragesic®, Fentora® should only be prescribed for opioid-tolerant patients. Risk of respiratory depression increased in elderly patients, debilitated patients, and patients with conditions associated with hypoxia or hypercapnia; usually occurs after administration of initial dose in nontolerant patients or when given with other drugs that depress respiratory function.

Disease-related concerns:

- Bradycardia: Use with caution when administering to patients with bradycardia or bradyarrhythmias.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur. Opioids may obscure the clinical course of head injury.
- Hepatic impairment: Use with caution in patients with hepatic dysfunction.
- Renal impairment: Use with caution in patients with renal impairment.
- Respiratory disease: Use with caution in patients with pre-existing respiratory compromise (hypoxia and/or hypercapnia), COPD or other obstructive pulmonary disease, and kyphoscoliosis or other skeletal disorder which may alter respiratory function; critical respiratory depression may occur, even at therapeutic dosages.

Concurrent drug therapy issues:

- CNS depressants: When using with other CNS depressants, reduce dose of one or both agents.
- CYP3A4 inhibitors: **[U.S. Boxed Warning]: Use with strong or moderate CYP3A4 inhibitors; may result in increased effects and potential respiratory depression.**

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects. Decrease initial dose.
- Pediatrics: Safety and efficacy have not been established in children <16 years of age for the lozenge and <18 years of age for the buccal tablet. **[U.S. Boxed Warning]: Safety and efficacy of the transdermal patch have been limited to children ≥2 years of age who are opioid-tolerant.**

Dosage form specific issues:

- Injection: May cause muscle rigidity; usually occurs following high doses; respiratory depression may persist beyond analgesic effect; monitor closely.
- Transmucosal: Lozenge (eg, Actiq®), buccal tablet (Fentora®): **[U.S. Boxed Warning]: Should be used only for the care of opioid-tolerant cancer patients with breakthrough pain and is intended for use by specialists who are knowledgeable in treating cancer pain.** Not approved for use in management of acute or postoperative pain. **[U.S. Boxed Warning]: Buccal tablet and lozenge preparations contain an amount of medication that can be fatal to children. Keep all units out of the reach of children and discard any open units properly. Patients and caregivers should be counseled on the dangers to children including the risk of exposure to partially-consumed units.**
- Transmucosal: Buccal tablet (Fentora®): **[U.S. Boxed Warning]: Due to the higher bioavailability of fentanyl in Fentora®, when converting patients from oral transmucosal fentanyl citrate (OTFC, Actiq®) to Fentora®, do not substitute Fentora® on a mcg-per-mcg basis for any other fentanyl product. [U.S. Boxed Warning]: Fentora® is contraindicated in the management of acute or postoperative pain, including headache/migraine. Serious adverse events, including death, have been reported when used inappropriately (improper dose or patient selection). [U.S. Boxed Warning]: Patients using Fentora® who experience breakthrough pain may only take one additional dose using the same strength and must wait four hours before taking another dose.**
- Transdermal patch: **[U.S. Boxed Warning]: Indicated for the management of persistent moderate-to-severe pain when around the clock pain control is needed for an extended time period. Should only be used in patients who are already receiving opioid therapy, are opioid tolerant, and who require a total daily dose equivalent to 25 mcg/hour transdermal patch. Contraindicated in patients who are not opioid tolerant, in the management of short-term analgesia, or in the management of postoperative pain. Should be applied only to intact skin. Use of a patch that has been cut, damaged, or altered in any way may result in overdosage.** Serum fentanyl concentrations may increase approximately one-third for patients with a body temperature of 40°C secondary to a temperature-dependent increase in fentanyl release from the patch and increased skin permeability. **[U.S. Boxed Warning]: Avoid exposure of application site and surrounding area to direct external heat sources.** Patients who experience fever or increase in core temperature should be monitored closely. Patients who experience adverse reactions should be monitored for at least 24 hours after removal of the patch. Transdermal patch does not contain any metal-based compounds; the printed ink used to indicate strength on the outer surface of the patch does contain titanium dioxide, but the amount is minimal; adverse events have not been reported while wearing during an MRI.

Other warnings/precautions:

- Abuse/misuse/diversion: **[U.S. Boxed Warning]: Healthcare provider should be alert to problems of abuse, misuse, and diversion.**
- Optimal regimen: An opioid-containing analgesic regimen should be tailored to each patient's needs and based upon the type of pain being treated (acute versus chronic), the route of administration, degree of tolerance for opioids (naive versus chronic user), age, weight, and medical condition. The optimal analgesic dose varies widely among patients; doses should be titrated to pain relief/prevention.
- Rapid infusion: Inject slowly over 3-5 minutes; rapid I.V. infusion may result in skeletal muscle and chest wall rigidity, impaired ventilation, or respiratory distress/arrest; nondepolarizing skeletal muscle relaxant may be required.
- Withdrawal: Concurrent use of agonist/antagonist analgesics may precipitate withdrawal symptoms and/or reduced analgesic efficacy in patients following prolonged therapy with mu opioid agonists. Abrupt discontinuation following prolonged use may also lead to withdrawal symptoms.

Geriatric ConsiderationsThe elderly may be particularly susceptible to the CNS depressant and constipating effects of narcotics; therefore, use with caution. The effect of age on the pharmacokinetics of Fentora® (oral transmucosal buccal tablets) has not been studied.

Pregnancy Risk FactorC/D (prolonged use or high doses at term)

Pregnancy ConsiderationsFentanyl crosses the placenta and has been used safely during labor. Chronic use during pregnancy has shown detectable serum levels in the newborn with mild opioid withdrawal (case report). Transdermal patch, transmucosal lozenge, and buccal tablet (Fentora®) are not recommended for analgesia during labor and delivery.

LactationEnters breast milk/not recommended (AAP rates “compatible”)

Breast-Feeding ConsiderationsFentanyl is excreted in low concentrations into breast milk. Breast-feeding is considered acceptable following single doses to the mother; however, no information is available when used long-term. **Note:** Transdermal patch, transmucosal lozenge, and buccal tablet (Fentora®) are not recommended in nursing women due to potential for sedation and/or respiratory depression.

Adverse Reactions

>10%:

Cardiovascular: Bradycardia, edema

Central nervous system: CNS depression, confusion, dizziness, drowsiness, headache, sedation

Gastrointestinal: Nausea, vomiting, constipation, xerostomia

Local: Application-site reaction erythema

Neuromuscular & skeletal: Chest wall rigidity (high dose I.V.), muscle rigidity, weakness

Ocular: Miosis

Respiratory: Dyspnea, respiratory depression

Miscellaneous: Diaphoresis

1% to 10%:

Cardiovascular: Cardiac arrhythmia, chest pain, flushing, hyper-/hypotension, orthostatic hypotension, pallor, palpitation, peripheral edema, syncope, tachycardia, vasodilation

Central nervous system: Abnormal dreams, abnormal thinking, agitation, amnesia, anxiety, chills, depression, euphoria, fatigue, fever, hallucinations, hypoesthesia, insomnia, lethargy, migraine, nervousness, paranoid reaction, stupor, vertigo

Dermatologic: Alopecia, bruising, cellulitis, erythema, hyperhidrosis, papules, pruritus, rash

Endocrine & metabolic: Breast pain, dehydration, hyper-/hypocalcemia, hyper-/hypoglycemia, hypoalbuminemia, hypokalemia, hypomagnesemia

Gastrointestinal: Abdominal pain, abnormal taste, anorexia, biliary tract spasm, diarrhea, dyspepsia, dysphagia (buccal tablet), flatulence, GI hemorrhage, gingival pain (buccal tablet), gingivitis (lozenge), glossitis (lozenge), ileus, periodontal abscess (lozenge/buccal tablet), stomatitis (lozenge/buccal tablet), weight loss

Genitourinary: Dysuria, urinary incontinence, urinary retention, vaginitis, vaginal hemorrhage

Hematologic: Anemia, leukopenia, neutropenia, thrombocytopenia

Hepatic: Ascites, jaundice

Local: Application site pain, application site irritation

Neuromuscular & skeletal: Abnormal coordination, abnormal gait, arthralgia, back pain, myalgia, neuropathy, paresthesia, rigors, tremor

Renal: Renal failure

Respiratory: Apnea, asthma, bronchitis, cough, epistaxis, hemoptysis, hypoventilation, hypoxia, nasopharyngitis, pharyngolaryngeal pain, pharyngitis, pneumonia, rhinitis, sinusitis, upper respiratory infection, wheezing

Miscellaneous: Hiccups, flu-like syndrome, lymphadenopathy, speech disorder

<1%, postmarketing, and/or case reports: Abdominal distention, amblyopia, allergic reaction, anaphylaxis, angina, anorgasmia, aphasia, bladder pain, blurred vision, bronchospasm, CNS excitation or delirium, cold/clammy skin, dental caries (lozenge), depersonalization, DVT, dysesthesia, ejaculatory difficulty, emotional lability, eructation, esophageal stenosis, exfoliative dermatitis, fecal impaction, flank pain, gum line erosion (lozenge), gum hemorrhage (lozenge), hematuria, hostility, hyper-/hypotonia, laryngospasm, libido decreased, moniliasis (lozenge/buccal tablet), mouth ulceration (lozenge/buccal tablet), myasthenia, nocturia, oliguria, pancytopenia, paradoxical dizziness, physical and psychological dependence with prolonged use, pleural effusion, polyuria, pustules, speech disorder, stertorous breathing, seizure, sputum increased, tooth loss (lozenge), urinary tract spasm, urticaria, vertigo

Oncology: VesicantNo

Metabolism/Transport Effects **Substrate** of CYP3A4 (major); **Inhibits** CYP3A4 (weak)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Beta-Blockers: Anilidopiperidine Opioids may enhance the bradycardic effect of Beta-Blockers. Anilidopiperidine Opioids may enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): Anilidopiperidine Opioids may enhance the bradycardic effect of Calcium Channel Blockers (Nondihydropyridine). Anilidopiperidine Opioids may enhance the hypotensive effect of Calcium Channel Blockers (Nondihydropyridine). *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

CYP3A4 Inhibitors (Strong): May increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

MAO Inhibitors: Anilidopiperidine Opioids may enhance the serotonergic effect of MAO Inhibitors. This could result in serotonin syndrome. Management: Avoid use of fentanyl (and other anilidopiperidine opioids when possible) in patients who have used a monoamine oxidase inhibitor within the past 14 days due to reports of unpredictable but severe adverse effects. *Risk D: Consider therapy modification*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the metabolism of FentaNYL. *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of FentaNYL. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: St John's wort may decrease fentanyl levels. Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Monitoring ParametersRespiratory and cardiovascular status, blood pressure, heart rate; signs of misuse, abuse, or addiction

Transdermal patch: Monitor for 24 hours after application of first dose

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for additive or adverse interactions. Monitor therapeutic effectiveness and signs of adverse or overdose reactions. Monitor blood pressure, CNS and respiratory status, and degree of sedation at beginning of therapy and at regular intervals with long-term use. Monitor closely for 24 hours after transdermal product is removed. Order safety precautions for inpatient use. May cause physical and/or psychological dependence. Assess knowledge/teach patient appropriate use (if self-administered), adverse reactions to report, and appropriate interventions to reduce side effects.

Patient EducationTake exactly as prescribed. Do not use more often or increase dosage, and do not use alcohol and other prescription or OTC medications (especially sedatives, tranquilizers, antihistamines, or pain medications) without consulting prescriber. If using oral transmucosal lozenge, you may be at risk for dental carries due to the sugar content. Maintain good oral hygiene. If using patch, avoid exposing application site to external heat sources (eg, heating pad, electric blanket, hot tub, heat lamp). Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause hypotension, dizziness, drowsiness, impaired coordination, or blurred vision (use caution when driving, climbing stairs, or changing position - rising from sitting or lying to standing, or when engaging in tasks requiring alertness until response to drug is known); nausea or vomiting (frequent mouth care, small frequent meals, chewing gum, or sucking lozenges may help); or constipation (increased exercise, fluids, fruit, or fiber may help; if unresolved, consult prescriber about use of stool softeners). Report acute dizziness, chest pain, slow or rapid heartbeat, acute headache; confusion or changes in mentation; changes in voiding frequency or amount; swelling of extremities or unusual weight gain; temperature >102°F; shortness of breath or respiratory difficulty; or vision changes. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Transdermal patch: Apply to clean, dry skin, immediately after removing from package. Firmly press in place and hold for 30 seconds.

Transmucosal lozenge (eg, Actiq®): Contains an amount of medication that can be fatal to children. Keep all units out of the reach of children and discard any open units properly. Actiq® Welcome Kits are available which contain educational materials, safe storage, and disposal instructions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Note: Strengths expressed as base.

Injection, solution, as citrate [preservative free]: 0.05 mg/mL (2 mL, 5 mL, 10 mL, 20 mL; 30 mL [DSC]; 50 mL)

Sublimaze®: 0.05 mg/mL (2 mL, 5 mL, 10 mL [DSC], 20 mL)

Lozenge, oral, as citrate [transmucosal]: 200 mcg, 400 mcg, 600 mcg, 800 mcg, 1200 mcg, 1600 mcg

Actiq®: 200 mcg, 400 mcg, 600 mcg, 800 mcg, 1200 mcg, 1600 mcg [contains sugar 2 g/lozenge; berry flavor]

Powder, for prescription compounding, as citrate: USP (1 g)

Tablet, for buccal application, as citrate:

Fentora®: 100 mcg, 200 mcg, 300 mcg, 400 mcg, 600 mcg, 800 mcg

Transdermal system, topical, as base: 12 (5s) [delivers 12.5 mcg/hour; 3.13 cm^2]; 12 (5s) [delivers 12.5 mcg/hour; 5 cm^2]; 25 (5s) [delivers 25 mcg/hour; 10 cm^2]; 25 (5s) [delivers 25 mcg/hour; 6.25 cm^2]; 50 (5s) [delivers 50 mcg/hour; 12.5 cm^2]; 50 (5s) [delivers 50 mcg/hour; 20 cm^2]; 75 (5s) [delivers 75 mcg/hour; 18.75 cm^2]; 75 (5s) [delivers 75 mcg/hour; 30 cm^2]; 100 (5s) [delivers 100 mcg/hour; 25 cm^2]; 100 (5s) [delivers 100 mcg/hour; 40 cm^2]

Duragesic®: 12 (5s) [delivers 12.5 mcg/hour; 5 cm^2; contains ethanol 0.1 mL/10 cm^2]; 25 (5s) [delivers 25 mcg/hour; 10 cm^2; contains ethanol 0.1 mL/10 cm^2]; 50 (5s) [delivers 50 mcg/hour; 20 cm^2; contains ethanol 0.1 mL/10 cm^2]; 75 (5s) [delivers 75 mcg/hour; 30 cm^2; contains ethanol 0.1 mL/10 cm^2]; 100 (5s) [delivers 100 mcg/hour; 40 cm^2; contains ethanol 0.1 mL/10 cm^2]

Generic AvailableYes: Excludes buccal tablet

Pricing: U.S. (www.drugstore.com)

Tablets (Fentora)

200 mcg (20): $412.65

Mechanism of ActionBinds with stereospecific receptors at many sites within the CNS, increases pain threshold, alters pain reception, inhibits ascending pain pathways

Pharmacodynamics/Kinetics

Onset of action: Analgesic: I.M.: 7-8 minutes; I.V.: Almost immediate; Transmucosal: 5-15 minutes

Peak effect: Transmucosal: Analgesic: 15-30 minutes

Duration: I.M.: 1-2 hours; I.V.: 0.5-1 hour; Transmucosal: Related to blood level; respiratory depressant effect may last longer than analgesic effect

Absorption:

Transdermal: Initial application: Gradually absorbed for the first 12-24 hours, followed by a constant absorption for the remainder of the dosing interval

Transmucosal, buccal tablet: Rapid, ~50% from the buccal mucosa; remaining 50% swallowed with saliva and slowly absorbed from GI tract.

Transmucosal, lozenge: Rapid, ~25% from the buccal mucosa; 75% swallowed with saliva and slowly absorbed from GI tract

Distribution: 4-6 L/kg; Highly lipophilic, redistributes into muscle and fat

Protein binding: 80% to 85%

Metabolism: Hepatic, primarily via CYP3A4

Bioavailability: Total (transmucosal and GI absorption): Buccal: 65% (range: 45% to 85%); Lozenge: 47% (range: 37% to 57%)

Half-life elimination:

I.V.: 2-4 hours

Transdermal patch: 17 hours (13-22 hours, half-life is influenced by absorption rate)

Transmucosal: Lozenge: 7 hours; Buccal tablet: 100-200 mcg: 3-4 hours, 400-800 mcg: 11-12 hours

Time to peak: Buccal tablet: 20-240 minutes (median: 47 minutes); Lozenge: 20-480 minutes (median: 20-40 minutes); Transdermal patch: 24-72 hours, after several sequential 72-hour applications, steady state serum concentrations are reached

Excretion: Urine 75% (primarily as metabolites, <7% to 10% as unchanged drug); feces ~9%

Pharmacotherapy PearlsFentanyl is 50-100 times as potent as morphine; morphine 10 mg I.M. is equivalent to fentanyl 0.1-0.2 mg I.M.; fentanyl has less hypotensive effects than morphine due to lack of histamine release. However, fentanyl may cause rigidity with high doses. If the patient has required high-dose analgesia or has used for a prolonged period (~7 days), taper dose to prevent withdrawal; monitor for signs and symptoms of withdrawal.

Transmucosal (oral lozenge): Disposal of lozenge units: After consumption of a complete unit, the handle may be disposed of in a trash container that is out of the reach of children. For a partially-consumed unit, or a unit that still has any drug matrix remaining on the handle, the handle should be placed under hot running tap water until the drug matrix has dissolved. Special child-resistant containers are available to temporarily store partially consumed units that cannot be disposed of immediately.

Transdermal patch (Duragesic®): Upon removal of the patch, ~17 hours are required before serum concentrations fall to 50% of their original values. Opioid withdrawal symptoms are possible. Gradual downward titration (potentially by the sequential use of lower-dose patches) is recommended. Keep transdermal patch (both used and unused) out of the reach of children. Do **not** use soap, alcohol, or other solvents to remove transdermal gel if it accidentally touches skin as they may increase transdermal absorption, use copious amounts of water. Avoid exposure of direct external heat sources (eg, heating pads, electric blankets, heat lamps, saunas, hot tubs, heated water beds) to application site.

Dental Health Professional ConsiderationsTransdermal fentanyl should not be used as a pain reliever in dentistry due to danger of hypoventilation

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia, changes in salivation (normal salivary flow resumes upon discontinuation), and orthostatic hypotension. Actiq® may contribute to dental carries due to sugar content of oral lozenge; advise patients to maintain good oral hygiene. See Dental Comment.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness, sedation, and depression are common; may rarely cause paradoxical CNS excitement or delirium

Mental Health: Effects on Psychiatric TreatmentConcurrent use with low potency antipsychotics and TCAs may produce additive hypotension

Cardiovascular ConsiderationsMay precipitate bradycardia, hypotension, and peripheral vasodilation. These properties necessitate close hemodynamic monitoring.

Anesthesia and Critical Care Concerns/Other ConsiderationsWhen developing a therapeutic plan for pain control, scheduled, intermittent opioid dosing or continuous infusion is preferred over the "as needed" regimen. The 2002 ACCM/SCCM guidelines for analgesia (critically-ill adult) recommend fentanyl in patients who need immediate pain relief because of its rapid onset of action. Repeated doses or a continuous infusion of fentanyl may cause accumulation. Fentanyl or hydromorphone is preferred in patients who are hypotensive or have renal dysfunction. Morphine or hydromorphone is recommended for intermittent, scheduled therapy. Both have a longer duration of action requiring less frequent administration. Fentanyl is great to prevent pain during a procedure and can be dosed intermittently for such an application. Prolonged analgesia requires an infusion.

Fentanyl has less hypotensive effects than morphine due to lack of histamine release; however, fentanyl may cause rigidity with high doses. If the patient has required high-dose analgesia or has used for a prolonged period (~7 days), taper dose to prevent withdrawal; monitor for signs and symptoms of withdrawal.

Index TermsFentanyl Citrate; Fentanyl Hydrochloride; OTFC (Oral Transmucosal Fentanyl Citrate)

Medication Safety Issues

Sound-alike/look-alike issues:

Ferrlecit® may be confused with Ferralet®

Pronunciation(FER ik GLOO koe nate)

U.S. Brand NamesFerrlecit®

Canadian Brand NamesFerrlecit®

Pharmacologic CategoryIron Salt

Use: Labeled IndicationsRepletion of total body iron content in patients with iron-deficiency anemia who are undergoing hemodialysis in conjunction with erythropoietin therapy

Dosing: AdultsRepletion of iron in hemodialysis patients: I.V.: 125 mg elemental iron per 10 mL (either by I.V. infusion or slow I.V. injection). Most patients will require a cumulative dose of 1 g elemental iron over approximately 8 sequential dialysis treatments to achieve a favorable response.

Note: A test dose of 2 mL diluted in NS 50 mL administered over 60 minutes was previously recommended (not in current manufacturer labeling). Doses >125 mg are associated with increased adverse events.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRepletion of iron in hemodialysis patients: I.V.: Children ≥6 years: 1.5 mg/kg of elemental iron (maximum: 125 mg/dose) diluted in NS 25 mL, administered over 60 minutes at 8 sequential dialysis sessions

Administration: I.V.I.V.: Adults: May be diluted prior to administration; avoid rapid administration. Solutions diluted for infusion should be infused over 1 hour. If administered undiluted, infuse slowly at a rate of up to 12.5 mg/minute.

StorageStore at 20°C to 25°C (68°F to 77°F). Do not freeze.

ReconstitutionFor I.V. infusion, dilute 10 mL ferric gluconate in 0.9% sodium chloride (children: 25 mL NS, adults: 100 mL NS); use immediately after dilution.

CompatibilityStable with 0.9% sodium chloride; do not mix with parenteral nutrition solutions or other medications.

ContraindicationsHypersensitivity to ferric gluconate or any component of the formulation; use in any anemia not caused by iron deficiency; iron overload

Warnings/Precautions

Concerns related to adverse effects:

- Flushing/hypotension: Flushing and transient hypotension may occur. May augment hemodialysis-induced hypotension.
- Hypersensitivity reactions: Potentially serious hypersensitivity reactions may occur; fatal immediate hypersensitivity reactions have occurred with other iron carbohydrate complexes. Avoid rapid administration.

Special populations:

- Elderly: Use with caution in the elderly.
- Pediatrics: Safety and efficacy have not been established in children <6 years of age.

Dosage form specific issues:

- Benzyl alcohol: Contains benzyl alcohol which has been associated with "gasping syndrome" in neonates.

Other warnings/precautions:

- Appropriate use: Use only in patients with documented iron deficiency; caution with hemoglobinopathies or other refractory anemias as iron overload may occur.

Geriatric ConsiderationsStudies in the elderly have not been done, nor were there sufficient numbers of the elderly in premarketing studies to identify any differences in the elderly using this drug. Monitor dose closely so as to avoid iron overload.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAdverse events were not observed in animal reproduction studies. There are no well-controlled studies available in pregnant women. It is recommended that pregnant women meet the dietary requirements of iron with diet and/or supplements in order to prevent adverse events associated with iron deficiency anemia in pregnancy. Treatment of iron deficiency anemia in pregnant women is the same as in nonpregnant women and in most cases, oral iron preparations may be used. Except in severe cases of maternal anemia, the fetus achieves normal iron stores regardless of maternal concentrations.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsIron is normally found in breast milk. Breast milk or iron fortified formulas generally provide enough iron to meet the recommended dietary requirements of infants. The amount of iron in breast milk is generally not influenced by maternal iron status.

Adverse ReactionsFrequency not defined.

Cardiovascular: Angina, bradycardia, chest pain, edema, hyper-/hypotension, hypervolemia, MI, pulmonary edema, syncope, tachycardia, thrombosis, vasodilation

Central nervous system: Agitation, chills, dizziness, fatigue, fever, headache, insomnia, malaise, pain, somnolence

Dermatologic: Pruritus, rash

Endocrine & metabolic: Hyper-/hypokalemia, hypoglycemia

Gastrointestinal: Abdominal pain, anorexia, diarrhea, dyspepsia, epigastric pain, eructation, flatulence, melena, nausea, vomiting

Genitourinary: Urinary tract infection

Hematologic: Abnormal erythrocytes, leukocytosis, lymphadenopathy

Local: Injection site reactions, injection site pain

Neuromuscular & skeletal: Arthralgia, back pain, cramps, groin pain, leg cramps, myalgia, paresthesia, rigors, weakness

Ocular: Blurred vision, conjunctivitis

Respiratory: Cough, dyspnea, pneumonia, rhinitis, upper respiratory infection

Miscellaneous: Carcinoma, diaphoresis increased, flu-like syndrome, hypersensitivity reactions, infection, sepsis

Postmarketing and/or case reports: Dry mouth, dysgeusia, hemorrhage, hypertonia, hypoesthesia, loss of consciousness, nervousness, pallor, phlebitis, seizure, shock, skin discoloration

Drug Interactions

ACE Inhibitors: May enhance the adverse/toxic effect of Ferric Gluconate. *Risk C: Monitor therapy*

Cefdinir: Iron Salts may decrease the serum concentration of Cefdinir. Red-appearing, non-bloody stools may also develop due to the formation of an insoluble iron-cefdinir complex. Management: Avoid concurrent cefdinir and iron when possible. Separating doses by several hours may minimize interaction. Iron-containing infant formulas do not appear to interact with cefdinir. *Risk D: Consider therapy modification*

Dimercaprol: May enhance the nephrotoxic effect of Iron Salts. *Risk X: Avoid combination*

Phosphate Supplements: Iron Salts may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Trientine: May decrease the serum concentration of Iron Salts. Iron Salts may decrease the serum concentration of Trientine. *Risk D: Consider therapy modification*

Test InteractionsSerum or transferrin bound iron levels may be falsely elevated if assessed within 24 hours of ferric gluconate administration. Serum ferritin levels may be falsely elevated for 5 days after ferric gluconate administration.

Monitoring ParametersHemoglobin and hematocrit, serum ferritin, iron saturation; vital signs

NKF K/DOQI guidelines recommend that iron status should be monitored monthly during initiation through the percent transferrin saturation (TSAT) and serum ferritin.

Reference RangeCKD patients should have sufficient iron to achieve and maintain hemoglobin of 11-12 g/dL. To achieve and maintain this target Hgb, sufficient iron should be administered to maintain a TSAT of 20%, and a serum ferritin level >100 ng/mL (nondialysis chronic kidney disease and peritoneal dialysis chronic kidney disease) or serum ferritin level >200 ng/mL (hemodialysis chronic kidney disease).

Nursing: Physical Assessment/MonitoringAssess results of test dose, infusion rate, effectiveness of therapy (laboratory results), and adverse reactions at beginning of therapy and periodically during therapy. Monitor blood pressure during infusion. Hypotension can occur. Be alert to the potential for hypersensitivity reactions. Assess knowledge/teach patient adverse symptoms to report.

Monitoring: Lab TestsHemoglobin and hematocrit, serum ferritin, iron saturation

NKF K/DOQI guidelines recommend that iron status should be monitored monthly during initiation through the percent transferrin saturation (TSAT) and serum ferritin.

Patient EducationThis medication will be administered by I.V. in conjunction with your dialysis treatment. Report chest pain, rapid heartbeat, or palpitations; respiratory difficulty; headache, dizziness, agitation, or inability to sleep; nausea, vomiting, abdominal or flank pain; or skin rash, itching, or redness. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution:

Ferrlecit®: Elemental iron 12.5 mg/mL (5 mL) [contains benzyl alcohol and sucrose 20%]

Generic AvailableNo

ManufacturerWatson Pharma, Inc

Mechanism of ActionSupplies a source to elemental iron necessary to the function of hemoglobin, myoglobin and specific enzyme systems; allows transport of oxygen via hemoglobin

Pharmacodynamics/KineticsHalf-life elimination: Bound: 1 hour

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation). Do not prescribe tetracyclines simultaneously with iron since GI tract absorption of both tetracycline and iron may be inhibited.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness, dizziness, insomnia, agitation

Mental Health: Effects on Psychiatric TreatmentMay cause hypotension; caution with low potency antipsychotics

Index TermsSodium Ferric Gluconate

International Brand NamesFerrlecit (CA)

Ferric Hexacyanoferrate

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(FER ik hex a SYE an oh fer ate)

U.S. Brand NamesRadiogardase®

Pharmacologic CategoryAntidote

Use: Labeled IndicationsTreatment of known or suspected internal contamination with radioactive cesium and/or radioactive or nonradioactive thallium

Dosing: Adults

Internal contamination with radioactive cesium and/or radioactive or nonradioactive thallium: Oral: 3 g 3 times/day; treatment should begin as soon as possible following exposure, but is also effective if therapy is delayed

Note: Cesium exposure: Once internal radioactivity is substantially decreased, dosage may be reduced to 1-2 g 3 times/day to improve gastrointestinal tolerance

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricInternal contamination with radioactive cesium and/or radioactive or nonradioactive thallium: Oral: Children:

2-12 years: 1 g 3 times/day; treatment should begin as soon as possible following exposure, but is also effective if therapy is delayed

>12 years: Refer to adult dosing.

Dosing: Renal ImpairmentStudies have not been conducted; however, ferric hexacyanoferrate is not renally eliminated.

Dosing: Hepatic ImpairmentStudies have not been conducted; however, effectiveness may be decreased due to decreased bile excretion of cesium and thallium.

Administration: OralCapsules may be opened and mixed with bland food or liquid (instruct patients that mouth and teeth may become blue). Administer with food to stimulate excretion of cesium or thallium. Increase dietary fiber or take with fiber laxative to decrease constipation.

Dietary ConsiderationsTake with food to stimulate excretion of cesium or thallium. A high-fiber diet or fiber laxative is recommended to avoid constipation.

StorageStore in the dark at controlled room temperature of 15°C to 30°C (59°F to 86°F).

ContraindicationsNone known

Allergy Considerations

- Iron Salt Allergy

Warnings/Precautions

Disease-related concerns:

- Cardiac arrhythmias: Use with caution in patients with pre-existing cardiac arrhythmias.
- Electrolyte imbalances: Use with caution in patients with electrolyte imbalances.
- Gastric immotility: Use with caution in patients with decreased gastric motility; constipation should be avoided to prevent increased radiation absorption from the gastrointestinal tract.

Other warnings/precautions:

- Patient information: Patients should be instructed to minimize radiation exposure to others.
- Radiation toxicity: Appropriate use: Ferric hexacyanoferrate increases the rate of elimination of thallium and cesium; it does not treat complications of radiation exposure. Supportive treatment for radiation toxicity should be given concomitantly. Additional decontamination and/or treatment may be needed if exposure to other radioactive isotopes is known or suspected.

Pregnancy Risk FactorC

Pregnancy ConsiderationsFerric hexacyanoferrate is not absorbed from the gastrointestinal tract and reproduction studies have not been conducted. Cesium-137 crosses the placenta; in one case, reported levels were equal in the mother and the neonate. Thallium also crosses the placenta; fetal death, failure to thrive, and alopecia in the neonate have been reported. Toxicity from exposure to thallium or radioactive cesium is expected to be greater than the risk of toxicity to ferric hexacyanoferrate. Oligospermia or azoospermia has been reported following whole body radiation in doses >1 Gy of cesium-137.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsExcretion of ferric hexacyanoferrate in breast milk is not known, but would not be expected. Cesium and thallium are excreted in breast milk; internally contaminated mothers should not breast-feed.

Adverse Reactions

>10%: Gastrointestinal: Constipation (24%)

1% to 10%: Endocrine & metabolic: Hypokalemia (7%)

Frequency not defined: Gastrointestinal: Gastric distress, fecal discoloration (blue)

Drug InteractionsThere are no known significant interactions.

Ethanol/Nutrition/Herb InteractionsFood: May increase effectiveness by stimulating bile secretion and thereby increasing the amount of cesium or thallium available to bind with ferric hexacyanoferrate. May bind with essential nutrients.

Monitoring Parameters

Bowel movements; CBC and electrolytes weekly

Baseline cesium and/or thallium exposure (whole body counting and/or bioassay, feces or urine sample); urine and fecal cesium and/or thallium weekly during therapy; residual whole body radioactivity after 30 days of treatment

Monitoring: Lab TestsCBC and electrolytes weekly; baseline cesium and/or thallium exposure (whole body counting and/or bioassay, feces or urine sample); urine and fecal cesium and/or thallium weekly during therapy; residual whole body radioactivity after 30 days of treatment

Patient Education

You may experience constipation (increasing exercise, fluids, and fruit/fiber may help).

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 0.5 g

Generic AvailableNo

ManufacturerDistributed by HEYL Chemisch-pharmazeutische Fabrik GmbH & Co KG

Mechanism of ActionBinds to cesium and thallium isotopes in the gastrointestinal tract following their ingestion or excretion in the bile; reduces their gastrointestinal reabsorption (enterohepatic circulation)

Pharmacodynamics/Kinetics

Absorption: Ferric hexacyanoferrate: Oral: None

Half-life elimination:

Cesium-137: Effective: Adults: 80 days, decreased by 69% with ferric hexacyanoferrate; adolescents: 62 days, decreased by 46% with ferric hexacyanoferrate; children: 42 days, decreased by 43% with ferric hexacyanoferrate

Nonradioactive thallium: Biological: 8-10 days; with ferric hexacyanoferrate: 3 days

Excretion:

Cesium-137: Without ferric hexacyanoferrate: Urine (~80%); feces (~20%)

Thallium: Without ferric hexacyanoferrate: Fecal to urine excretion ration: 2:1

Ferric hexacyanoferrate: Feces (99%, unchanged)

Pharmacotherapy PearlsDetailed treatment information should be reported to the manufacturer; contact the manufacturer or the complete prescribing information for data collection forms. In case of thallium intoxication, elimination of thallium may also be increased by: Induced emesis followed by intubation and lavage; forced diuresis if urinary excretion is <1 mg/24 hours; charcoal hemoperfusion during the first 48 hours following ingestion; hemodialysis

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentConstipation is common; concurrent use with anticholinergic psychotropics (eg, clozapine or chlorpromazine) may produce additive effects. May cause hypokalemia; monitor potassium in patients receiving ziprasidone.

Index TermsFerric (III) Hexacyanoferrate (II); Insoluble Prussian Blue; Prussian Blue

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Feostat® may be confused with Feosol®

Pronunciation(FER us FYOO ma rate)

U.S. Brand NamesFemiron® [OTC]; Feostat® [OTC] [DSC]; Ferretts [OTC]; Ferro-Sequels® [OTC]; Hemocyte® [OTC]; Ircon® [OTC]; Nephro-Fer® [OTC]

Canadian Brand NamesPalafer®

Pharmacologic CategoryIron Salt

Use: Labeled IndicationsPrevention and treatment of iron-deficiency anemias

Dosing: Adults

Dietary Reference Intake: Dose is RDA presented as elemental iron unless otherwise noted:

19-50 years: Male: 8 mg/day; Female: 18 mg/day; Pregnant female: 27 mg/day; Lactating female: 9 mg/day

≥50 years: 8 mg/day

Doses expressed in terms of elemental iron; elemental iron content of ferrous fumarate is 33%.

Treatment of iron deficiency: Oral: Usual range: 150-200 mg elemental iron/day in divided doses; 60-100 mg elemental iron twice daily, up to 60 mg elemental iron 4 times/day

Prophylaxis of iron deficiency: Oral: 60-100 mg elemental iron/day

Note: To avoid GI upset, start with a single daily dose and increase by 1 tablet/day each week or as tolerated until desired daily dose is achieved

Dosing: Elderly200 mg elemental iron 3-4 times/day

Dosing: Pediatric

Dietary Reference Intake: Dose is RDA presented as elemental iron unless otherwise noted:

0-6 months: 0.27 mg/day (adequate intake)

7-12 months: 11 mg/day

1-3 years: 7 mg/day

4-8 years: 10 mg/day

9-13 years: 8 mg/day

14-18 years: Male: 11 mg/day; Female: 15 mg/day; Pregnant female: 27 mg/day; Lactating female: 10 mg/day

Doses expressed in terms of elemental iron; elemental iron content of ferrous fumarate is 33%.

Treatment of severe iron-deficiency anemia: Oral: 4-6 mg elemental iron/kg/day in 3 divided doses

Treatment of mild-to-moderate iron-deficiency anemia: Oral: 3 mg elemental iron/kg/day in 1-2 divided doses

Prophylaxis of iron deficiency: Oral: 1-2 mg elemental iron/kg/day

Administration: OralAdminister 2 hours prior to or 4 hours after antacids.

Dietary ConsiderationsShould be taken with water or juice on an empty stomach; may be administered with food to prevent irritation; however, not with cereals, dietary fiber, tea, coffee, eggs, or milk.

Elemental iron content of ferrous fumarate: 33%

Dietary sources of iron include beans, cereal (enriched), clams, beef, lentils, liver, oysters, shrimp, and turkey. Foods that enhance dietary absorption of iron include broccoli, grapefruit, orange juice, peppers and strawberries. Foods that decrease dietary absorption of iron include coffee, dairy products, soy products, spinach, and tea.

StorageIron is a leading cause of fatal poisoning in children. Store out of children's reach and in child-resistant containers.

ContraindicationsHypersensitivity to iron salts or any component of the formulation; hemochromatosis, hemolytic anemia

Allergy Considerations

- Iron Salt Allergy

Warnings/Precautions

Boxed warnings:

- Iron toxicity: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Iron toxicity: **[U.S. Boxed Warning]: Severe iron toxicity may occur in overdose, particularly when ingested by children; iron is a leading cause of fatal poisoning in children; store out of children's reach and in child-resistant containers.**

Disease-related concerns:

- Gastrointestinal disease: Avoid in patients with peptic ulcer, enteritis, or ulcerative colitis.

Special populations:

- Blood transfusion recipients: Avoid in patients receiving frequent blood transfusions.

- Elderly: Anemia in the elderly is often caused by “anemia of chronic disease” or associated with inflammation rather than blood loss. Iron stores are usually normal or increased, with a serum ferritin >50 ng/mL and a decreased total iron binding capacity. Hence, the “anemia of chronic disease” is not secondary to iron deficiency but the inability of the reticuloendothelial system to reclaim available iron stores.

- Premature infants: Avoid use in premature infants until the vitamin E stores, deficient at birth, are replenished.

Other warnings/precautions:

- Duration of therapy: Administration of iron for >6 months should be avoided except in patients with continuous bleeding or menorrhagia.

Geriatric ConsiderationsAnemia in the elderly is often caused by “anemia of chronic disease”, a result of aging changes in the bone marrow, or associated with inflammation rather than blood loss. Iron stores are usually normal or increased, with a serum ferritin >50 ng/mL and a decreased total iron binding capacity. Hence, the anemia is not secondary to iron deficiency but the inability of the reticuloendothelial system to use available iron stores. Timed release iron preparations should be avoided due to their erratic absorption. Products combined with a laxative or stool softener should not be used unless the need for the combination is demonstrated.

Pregnancy ConsiderationsIt is recommended that pregnant women meet the dietary requirements of iron with diet and/or supplements in order to prevent adverse events associated with iron deficiency anemia in pregnancy. Treatment of iron deficiency anemia in pregnant women is the same as in nonpregnant women and in most cases, oral iron preparations may be used. Except in severe cases of maternal anemia, the fetus achieves normal iron stores regardless of maternal concentrations.

LactationEnters breast milk

Breast-Feeding ConsiderationsIron is normally found in breast milk. Breast milk or iron-fortified formulas generally provide enough iron to meet the recommended dietary requirements of infants. The amount of iron in breast milk is generally not influenced by maternal iron status.

Adverse Reactions

>10%: Gastrointestinal: Stomach cramping, constipation, nausea, vomiting, dark stools

1% to 10%:

Gastrointestinal: Heartburn, diarrhea, staining of teeth

Genitourinary: Discoloration of urine

<1%: Contact irritation

Drug Interactions

Antacids: May decrease the absorption of Iron Salts. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Iron Salts may decrease the absorption of Bisphosphonate Derivatives. Only oral iron salts are of concern. **Exceptions:** Pamidronate; Zoledronic Acid. *Risk D: Consider therapy modification*

Cefdinir: Iron Salts may decrease the serum concentration of Cefdinir. Red-appearing, non-bloody stools may also develop due to the formation of an insoluble iron-cefdinir complex. Management: Avoid concurrent cefdinir and iron when possible. Separating doses by several hours may minimize interaction. Iron-containing infant formulas do not appear to interact with cefdinir. *Risk D: Consider therapy modification*

Dimercaprol: May enhance the nephrotoxic effect of Iron Salts. *Risk X: Avoid combination*

H2-Antagonists: May decrease the absorption of Iron Salts. *Risk C: Monitor therapy*

Levodopa: Iron Salts may decrease the absorption of Levodopa. Only applies to oral iron preparations. *Risk D: Consider therapy modification*

Methyldopa: Iron Salts may decrease the absorption of Methyldopa. Only oral iron salts are of concern. *Risk D: Consider therapy modification*

Penicillamine: Iron Salts may decrease the absorption of Penicillamine. Only oral iron salts are a concern. *Risk D: Consider therapy modification*

Phosphate Supplements: Iron Salts may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Proton Pump Inhibitors: May decrease the absorption of Iron Salts. *Risk C: Monitor therapy*

Quinolone Antibiotics: Iron Salts may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. *Risk D: Consider therapy modification*

Tetracycline Derivatives: Iron Salts may decrease the absorption of Tetracycline Derivatives. Only a concern with orally administered products. *Risk D: Consider therapy modification*

Trientine: May decrease the serum concentration of Iron Salts. Iron Salts may decrease the serum concentration of Trientine. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions Food: Cereals, dietary fiber, tea, coffee, eggs, and milk may decrease absorption.

Reference Range

Serum iron:

Male: 75-175 mcg/dL (SI: 13.4-31.3 µmol/L)

Female: 65-165 mcg/dL (SI: 11.6-29.5 µmol/L)

Total iron binding capacity: 230-430 mcg/dL

Transferrin: 204-360 mg/dL

Percent transferrin saturation: 20% to 50%

Iron levels >300 mcg/dL can be considered toxic, should be treated as an overdose

Patient Education May color stool black. Take between meals for maximum absorption; take with food if GI upset occurs. Do not take with milk or antacids. Keep out of reach of children.

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Tablet: 324 mg [elemental iron 106 mg]

Femiron®: 63 mg [elemental iron 20 mg]

Ferretts: 325 mg [elemental iron 106 mg]

Hemocyte®: 324 mg [elemental iron 106 mg]

Ircon®: 200 mg [elemental iron 66 mg]

Nephro-Fer®: 350 mg [elemental iron 115 mg; contains tartrazine]

Tablet, chewable (Feostat®): 100 mg [elemental iron 33 mg; chocolate flavor] [DSC]

Tablet, timed release (Ferro-Sequels®): 150 mg [elemental iron 50 mg; contains docusate sodium and sodium benzoate]

Generic Available Yes: Tablet

Mechanism of Action Replaces iron found in hemoglobin, myoglobin, and enzymes; allows the transportation of oxygen via hemoglobin

Pharmacodynamics/Kinetics

Onset of action: Hematologic response: Oral, parenteral iron salts: ~3-10 days

Peak effect: Reticulocytosis: 5-10 days; hemoglobin values increase within 2-4 weeks

Absorption: Iron is absorbed in the duodenum and upper jejunum; in persons with normal serum iron stores, 10% of an oral dose is absorbed, this is increased to 20% to 30% in persons with inadequate iron stores. Food and achlorhydria will decrease absorption.

Protein binding: To serum transferrin

Excretion: Urine, sweat, sloughing of intestinal mucosa, and menses

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Staining of teeth. Do not prescribe tetracyclines simultaneously with iron since GI tract absorption of both tetracycline and iron may be inhibited.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status None reported

Mental Health: Effects on Psychiatric Treatment Constipation is common; concurrent use with psychotropic agents may increase the risk

Index Terms Iron Fumarate

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(FER us GLOO koe nate)

U.S. Brand NamesFergon® [OTC]

Canadian Brand NamesApo-Ferrous Gluconate®; Novo-Ferrogluc

Pharmacologic CategoryIron Salt

Use: Labeled IndicationsPrevention and treatment of iron-deficiency anemias

Dosing: Adults

Dietary Reference Intake: Dose is RDA presented as elemental iron unless otherwise noted:

19-50 years: Male: 8 mg/day; Female: 18 mg/day; Pregnant female: 27 mg/day; Lactating female: 9 mg/day

≥50 years: 8 mg/day

Dose expressed in terms of elemental iron:

Treatment of iron deficiency anemia: Oral: 60 mg twice daily up to 60 mg 4 times/day

Prophylaxis of iron deficiency: Oral: 60 mg/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Dietary Reference Intake: Dose is RDA presented as elemental iron unless otherwise noted:

0-6 months: 0.27 mg/day (adequate intake)

7-12 months: 11 mg/day

1-3 years: 7 mg/day

4-8 years: 10 mg/day

9-13 years: 8 mg/day

14-18 years: Male: 11 mg/day; Female: 15 mg/day; Pregnant female: 27 mg/day; Lactating female: 10 mg/day

Dose expressed in terms of elemental iron:

Treatment of severe iron-deficiency anemia: Oral: 4-6 mg Fe/kg/day in 3 divided doses

Treatment of mild-to-moderate iron-deficiency anemia: Oral: 3 mg Fe/kg/day in 1-2 divided doses

Prophylaxis: Oral: 1-2 mg Fe/kg/day

Administration: OralAdminister 2 hours before or 4 hours after antacids. Administration of iron preparations to premature infants with vitamin E deficiency may cause increased red cell hemolysis and hemolytic anemia, therefore, vitamin E deficiency should be corrected if possible.

Dietary ConsiderationsShould be taken with water or juice on an empty stomach; may be administered with food to prevent irritation; however, not with cereals, dietary fiber, tea, coffee, eggs, or milk.

Elemental iron content of ferrous gluconate: 12%

Dietary sources of iron include beans, cereal (enriched), clams, beef, lentils, liver, oysters, shrimp, and turkey. Foods that enhance dietary absorption of iron include broccoli, grapefruit, orange juice, peppers and strawberries. Foods that decrease dietary absorption of iron include coffee, dairy products, soy products, spinach, and tea.

StorageIron is a leading cause of fatal poisoning in children. Store out of children's reach and in child-resistant containers.

ContraindicationsHypersensitivity to iron salts or any component of the formulation; hemochromatosis, hemolytic anemia

Allergy Considerations

- Iron Salt Allergy

Warnings/Precautions

Boxed warnings:

- Iron toxicity: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Iron toxicity: **[U.S. Boxed Warning]: Severe iron toxicity may occur in overdose, particularly when ingested by children; iron is a leading cause of fatal poisoning in children; store out of children's reach and in child-resistant containers.**

Disease-related concerns:

- Gastrointestinal disease: Avoid in patients with peptic ulcer, enteritis, or ulcerative colitis.

Special populations:

- Blood transfusion recipients: Avoid in patients receiving frequent blood transfusions.

- Elderly: Anemia in the elderly is often caused by “anemia of chronic disease” or associated with inflammation rather than blood loss. Iron stores are usually normal or increased, with a serum ferritin >50 ng/mL and a decreased total iron binding capacity. Hence, the “anemia of chronic disease” is not secondary to iron deficiency but the inability of the reticuloendothelial system to reclaim available iron stores.

- Premature infants: Avoid use in premature infants until the vitamin E stores, deficient at birth, are replenished.

Other warnings/precautions:

- Duration of therapy: Administration of iron for >6 months should be avoided except in patients with continuous bleeding or menorrhagia.

Geriatric ConsiderationsAnemia in the elderly is often caused by “anemia of chronic disease”, a result of aging changes in the bone marrow, or associated with inflammation rather than blood loss. Iron stores are usually normal or increased, with a serum ferritin >50 ng/mL and a decreased total iron binding capacity. Hence, the anemia is not secondary to iron deficiency but the inability of the reticuloendothelial system to use available iron stores. Timed release iron preparations should be avoided due to their erratic absorption. Products combined with a laxative or stool softener should not be used unless the need for the combination is demonstrated.

Pregnancy ConsiderationsIt is recommended that pregnant women meet the dietary requirements of iron with diet and/or supplements in order to prevent adverse events associated with iron deficiency anemia in pregnancy. Treatment of iron deficiency anemia in pregnant women is the same as in nonpregnant women and in most cases, oral iron preparations may be used. Except in severe cases of maternal anemia, the fetus achieves normal iron stores regardless of maternal concentrations.

LactationEnters breast milk

Breast-Feeding ConsiderationsIron is normally found in breast milk. Breast milk or iron fortified formulas generally provide enough iron to meet the recommended dietary requirements of infants. The amount of iron in breast milk is generally not influenced by maternal iron status.

Adverse Reactions

>10%: Gastrointestinal: Stomach cramping, constipation, nausea, vomiting, dark stools

1% to 10%:

Gastrointestinal: Heartburn, diarrhea, staining of teeth

Genitourinary: Discoloration of urine

<1%: Contact irritation

Drug Interactions

Antacids: May decrease the absorption of Iron Salts. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Iron Salts may decrease the absorption of Bisphosphonate Derivatives. Only oral iron salts are of concern. **Exceptions:** Pamidronate; Zoledronic Acid. *Risk D: Consider therapy modification*

Cefdinir: Iron Salts may decrease the serum concentration of Cefdinir. Red-appearing, non-bloody stools may also develop due to the formation of an insoluble iron-cefdinir complex. Management: Avoid concurrent cefdinir and iron when possible. Separating doses by several hours may minimize interaction. Iron-containing infant formulas do not appear to interact with cefdinir. *Risk D: Consider therapy modification*

Dimercaprol: May enhance the nephrotoxic effect of Iron Salts. *Risk X: Avoid combination*

H2-Antagonists: May decrease the absorption of Iron Salts. *Risk C: Monitor therapy*

Levodopa: Iron Salts may decrease the absorption of Levodopa. Only applies to oral iron preparations. *Risk D: Consider therapy modification*

Methyldopa: Iron Salts may decrease the absorption of Methyldopa. Only oral iron salts are of concern. *Risk D: Consider therapy modification*

Penicillamine: Iron Salts may decrease the absorption of Penicillamine. Only oral iron salts are a concern. *Risk D: Consider therapy modification*

Phosphate Supplements: Iron Salts may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Proton Pump Inhibitors: May decrease the absorption of Iron Salts. *Risk C: Monitor therapy*

Quinolone Antibiotics: Iron Salts may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. *Risk D: Consider therapy modification*

Tetracycline Derivatives: Iron Salts may decrease the absorption of Tetracycline Derivatives. Only a concern with orally administered products. *Risk D: Consider therapy modification*

Trientine: May decrease the serum concentration of Iron Salts. Iron Salts may decrease the serum concentration of Trientine. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsFood: Cereals, dietary fiber, tea, coffee, eggs, and milk may decrease absorption.

Test InteractionsFalse-positive for blood in stool by the guaiac test

Monitoring ParametersSerum iron, total iron binding capacity, reticulocyte count, hemoglobin

Reference RangeTherapeutic: Male: 75-175 mcg/dL (SI: 13.4-31.3 µmol/L); Female: 65-165 mcg/dL (SI: 11.6-29.5 µmol/L); serum iron level >300 mcg/dL usually requires treatment of overdose due to severe toxicity

Monitoring: Lab TestsSerum iron, total iron binding capacity, reticulocyte count, hemoglobin

Patient EducationMay color stool black. Take between meals for maximum absorption; take with food if GI upset occurs. Do not take with milk or antacids. Keep out of reach of children.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Tablet: 246 mg [elemental iron 28 mg]; 300 mg [elemental iron 34 mg] [DSC]; 325 mg [elemental iron 36 mg]

Fergon®: 240 mg [elemental iron 27 mg]

Generic AvailableYes

Mechanism of ActionReplaces iron found in hemoglobin, myoglobin, and enzymes; allows the transportation of oxygen via hemoglobin

Pharmacodynamics/KineticsOnset of action: Hematologic response: Oral: 3-10 days; peak reticulocytosis occurs in 5-10 days, and hemoglobin values increase in ~2-4 weeks

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Staining of teeth. Do not prescribe tetracyclines simultaneously with iron since GI tract absorption of both tetracycline and iron may be inhibited.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentConstipation is common; concurrent use with psychotropic agents may increase the risk

Pronunciation(FER us SUL fate & a SKOR bik AS id)

U.S. Brand NamesFero-Grad 500® [OTC]; Vitelle™ Irospan® [OTC] [DSC]

Pharmacologic CategoryIron Salt; Vitamin

Use: Labeled IndicationsTreatment of iron deficiency in nonpregnant adults; treatment and prevention of iron deficiency in pregnant adults

Dosing: AdultsIron deficiency: Oral: 1 tablet daily

Dosing: ElderlyRefer to adult dosing.

Dietary ConsiderationsShould be taken with water or juice on an empty stomach; may be administered with food to prevent irritation; however, not with cereals, dietary fiber, tea, coffee, eggs, or milk.

StorageIron is a leading cause of fatal poisoning in children Store out of children's reach and in child-resistant containers.

ContraindicationsBased on **ferrous sulfate** component: Hypersensitivity to iron salts or any component of the formulation; hemochromatosis, hemolytic anemia

Allergy Considerations

- Iron Salt Allergy

Warnings/Precautions

Boxed warnings:

- Iron toxicity: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Iron toxicity: **[U.S. Boxed Warning]: Severe iron toxicity may occur in overdose, particularly when ingested by children; iron is a leading cause of fatal poisoning in children; store out of children's reach and in child-resistant containers.**

Disease-related concerns:

- Gastrointestinal disease: Avoid ferrous sulfate in patients with peptic ulcer, enteritis, or ulcerative colitis.

Special populations:

- Blood transfusion recipients: Avoid in patients receiving frequent blood transfusions.

- Elderly: Anemia in the elderly is often caused by “anemia of chronic disease” or associated with inflammation rather than blood loss. Iron stores are usually normal or increased, with a serum ferritin >50 ng/mL and a decreased total iron binding capacity. Hence, the “anemia of chronic disease” is not secondary to iron deficiency but the inability of the reticuloendothelial system to reclaim available iron stores.

- Premature infants: Avoid use in premature infants until the vitamin E stores, deficient at birth, are replenished.

Other warnings/precautions:

- Duration of therapy: Administration of iron for >6 months should be avoided except in patients with continuous bleeding or menorrhagia.

Pregnancy ConsiderationsSee individual agents.

Breast-Feeding ConsiderationsSee individual agents.

Adverse ReactionsBased on **ferrous sulfate** component:

>10%: Gastrointestinal: GI irritation, epigastric pain, nausea, dark stools, vomiting, stomach cramping, constipation

1% to 10%:

Gastrointestinal: Heartburn, diarrhea

Genitourinary: Discoloration of urine

Miscellaneous: Liquid preparations may temporarily stain the teeth

<1%: Contact irritation

Drug Interactions

Aluminum Hydroxide: Ascorbic Acid may increase the absorption of Aluminum Hydroxide. *Risk D: Consider therapy modification*

Amphetamines: Gastrointestinal Acidifying Agents may decrease the serum concentration of Amphetamines. *Risk C: Monitor therapy*

Antacids: May decrease the absorption of Iron Salts. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Iron Salts may decrease the absorption of Bisphosphonate Derivatives. Only oral iron salts are of concern. **Exceptions:** Pamidronate; Zoledronic Acid. *Risk D: Consider therapy modification*

Cefdinir: Iron Salts may decrease the serum concentration of Cefdinir. Red-appearing, non-bloody stools may also develop due to the formation of an insoluble iron-cefdinir complex. Management: Avoid concurrent cefdinir and iron when possible. Separating doses by several hours may minimize interaction. Iron-containing infant formulas do not appear to interact with cefdinir. *Risk D: Consider therapy modification*

Deferoxamine: Ascorbic Acid may enhance the adverse/toxic effect of Deferoxamine. Left ventricular dysfunction is of particular concern. *Risk D: Consider therapy modification*

Dimercaprol: May enhance the nephrotoxic effect of Iron Salts. *Risk X: Avoid combination*

H2-Antagonists: May decrease the absorption of Iron Salts. *Risk C: Monitor therapy*

Levodopa: Iron Salts may decrease the absorption of Levodopa. Only applies to oral iron preparations. *Risk D: Consider therapy modification*

Levothyroxine: Ferrous Sulfate may decrease the serum concentration of Levothyroxine. *Risk D: Consider therapy modification*

Methyldopa: Iron Salts may decrease the absorption of Methyldopa. Only oral iron salts are of concern. *Risk D: Consider therapy modification*

Penicillamine: Iron Salts may decrease the absorption of Penicillamine. Only oral iron salts are a concern. *Risk D: Consider therapy modification*

Phosphate Supplements: Iron Salts may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Proton Pump Inhibitors: May decrease the absorption of Iron Salts. *Risk C: Monitor therapy*

Quinolone Antibiotics: Iron Salts may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. *Risk D: Consider therapy modification*

Tetracycline Derivatives: Iron Salts may decrease the absorption of Tetracycline Derivatives. Only a concern with orally administered products. *Risk D: Consider therapy modification*

Trientine: May decrease the serum concentration of Iron Salts. Iron Salts may decrease the serum concentration of Trientine. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsFood: Cereals, dietary fiber, tea, coffee, eggs, and milk may decrease absorption.

Special Alerts

Medication Safety Issue: Change in Concentration/Dosage of Fer-In-Sol® Pediatric Oral Iron Drops - November 2008

Mead Johnson Nutritionals, the maker of Enfamil® oral liquid iron supplement drops Fer-In-Sol®, has recently changed the concentration, and therefore, the dosing of its product. The new labeling indicates that the dose needed to deliver 15 mg of elemental iron has changed from 0.6 mL to 1 mL. Prior to this change, 0.6 mL of Fer-In-Sol® provided 15 mg of elemental iron. The markings on the provided dropper have changed to 0.5 mL and 1 mL instead of 0.3 mL and 0.6 mL to reflect the dosing change. Ferrous sulfate drops made by other manufacturers are still available as the 15 mg/0.6 mL concentration. Due to the concern for potential medication errors, healthcare providers need to be aware of this change and verify the concentration of iron in the actual product being dispensed (generics or unused inventory of Fer-In-Sol® manufactured prior to the change) to ensure the correct volume needed to provide the dose intended. It is recommended that prescribers write prescriptions using dose required, rather than mL needed, and pharmacists should clarify dose if a prescription is written as volume.

Medication Safety Issues

Sound-alike/look-alike issues:

Feosol® may be confused with Feostat®, Fer-In-Sol®

Fer-In-Sol® may be confused with Feosol®

Slow FE® may be confused with Slow-K®

Pronunciation(FER us SUL fate)

U.S. Brand NamesFeosol® [OTC]; Fer-Gen-Sol [OTC]; Fer-In-Sol® [OTC]; Fer-Iron® [OTC]; Feratab® [OTC]; MyKidz Iron 10™; Slow FE® [OTC]

Canadian Brand NamesApo-Ferrous Sulfate®; Fer-In-Sol®; Ferodan™

Pharmacologic CategoryIron Salt

Use: Labeled IndicationsPrevention and treatment of iron-deficiency anemias

Dosing: Adults

Dietary Reference Intake: Dose is RDA presented as elemental iron unless otherwise noted:

19-50 years: Male: 8 mg/day; Female: 18 mg/day; Pregnant female: 27 mg/day; Lactating female: 9 mg/day

≥50 years: 8 mg/day

Dose expressed in terms of ferrous sulfate:

Treatment of iron deficiency anemia: Oral: 300 mg twice daily up to 300 mg 4 times/day or 250 mg (extended release) 1-2 times/day

Prophylaxis of iron deficiency: Oral: 300 mg/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Dietary Reference Intake: Dose is RDA presented as elemental iron unless otherwise noted:

0-6 months: 0.27 mg/day (adequate intake)

7-12 months: 11 mg/day

1-3 years: 7 mg/day

4-8 years: 10 mg/day

9-13 years: 8 mg/day

14-18 years: Male: 11 mg/day; Female: 15 mg/day; Pregnant female: 27 mg/day; Lactating female: 10 mg/day

Dosage expressed in terms of elemental iron:

Treatment of severe iron-deficiency anemia: Oral: 4-6 mg Fe/kg/day in 3 divided doses

Treatment of mild-to-moderate iron-deficiency anemia: Oral: 3 mg Fe/kg/day in 1-2 divided doses

Prophylaxis: Oral: 1-2 mg Fe/kg/day up to a maximum of 15 mg/day

Dietary ConsiderationsShould be taken with water or juice on an empty stomach; may be administered with food to prevent irritation; however, not with cereals, dietary fiber, tea, coffee, eggs, or milk.

Elemental iron content of iron salts in ferrous sulfate is 20% (ie, 300 mg ferrous sulfate is equivalent to 60 mg ferrous iron)

Dietary sources of iron include beans, cereal (enriched), clams, beef, lentils, liver, oysters, shrimp, and turkey. Foods that enhance dietary absorption of iron include broccoli, grapefruit, orange juice, peppers and strawberries. Foods that decrease dietary absorption of iron include coffee, dairy products, soy products, spinach, and tea.

StorageIron is a leading cause of fatal poisoning in children. Store out of children's reach and in child-resistant containers.

ContraindicationsHypersensitivity to iron salts or any component of the formulation; hemochromatosis, hemolytic anemia

Allergy Considerations

- Iron Salt Allergy

Warnings/Precautions

Boxed warnings:

- Iron toxicity: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Iron toxicity: **[U.S. Boxed Warning]: Severe iron toxicity may occur in overdose, particularly when ingested by children; iron is a leading cause of fatal poisoning in children; store out of children's reach and in child-resistant containers.**

Disease-related concerns:

- Gastrointestinal disease: Avoid in patients with peptic ulcer, enteritis, or ulcerative colitis.

Special populations:

- Blood transfusion recipients: Avoid in patients receiving frequent blood transfusions.
- Elderly: Anemia in the elderly is often caused by “anemia of chronic disease” or associated with inflammation rather than blood loss. Iron stores are usually normal or increased, with a serum ferritin >50 ng/mL and a decreased total iron binding capacity. Hence, the “anemia of chronic disease” is not secondary to iron deficiency but the inability of the reticuloendothelial system to reclaim available iron stores.
- Premature infants: Avoid use in premature infants until the vitamin E stores, deficient at birth, are replenished.

Other warnings/precautions:

- Duration of therapy: Administration of iron for >6 months should be avoided except in patients with continuous bleeding or menorrhagia.

Geriatric ConsiderationsAnemia in the elderly is often caused by “anemia of chronic disease”, a result of aging changes in the bone marrow, or associated with inflammation rather than blood loss. Iron stores are usually normal or increased, with a serum ferritin >50 ng/mL and a decreased total iron binding capacity. Hence, the anemia is not secondary to iron deficiency but the inability of the reticuloendothelial system to use available iron stores. Timed release iron preparations should be avoided due to their erratic absorption. Products combined with a laxative or stool softener should not be used unless the need for the combination is demonstrated.

Pregnancy ConsiderationsIt is recommended that pregnant women meet the dietary requirements of iron with diet and/or supplements in order to prevent adverse events associated with iron deficiency anemia in pregnancy. Treatment of iron deficiency anemia in pregnant women is the same as in nonpregnant women and in most cases, oral iron preparations may be used. Except in severe cases of maternal anemia, the fetus achieves normal iron stores regardless of maternal concentrations.

LactationEnters breast milk

Breast-Feeding ConsiderationsIron is normally found in breast milk. Breast milk or iron fortified formulas generally provide enough iron to meet the recommended dietary requirements of infants. The amount of iron in breast milk is generally not influenced by maternal iron status.

Adverse Reactions

>10%: Gastrointestinal: GI irritation, epigastric pain, nausea, dark stools, vomiting, stomach cramping, constipation

1% to 10%:

Gastrointestinal: Heartburn, diarrhea

Genitourinary: Discoloration of urine

Miscellaneous: Liquid preparations may temporarily stain the teeth

<1%: Contact irritation

Drug Interactions

Antacids: May decrease the absorption of Iron Salts. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Iron Salts may decrease the absorption of Bisphosphonate Derivatives. Only oral iron salts are of concern. **Exceptions:** Pamidronate; Zoledronic Acid. *Risk D: Consider therapy modification*

Cefdinir: Iron Salts may decrease the serum concentration of Cefdinir. Red-appearing, non-bloody stools may also develop due to the formation of an insoluble iron-cefdinir complex. Management: Avoid concurrent cefdinir and iron when possible. Separating doses by several hours may minimize interaction. Iron-containing infant formulas do not appear to interact with cefdinir. *Risk D: Consider therapy modification*

Dimercaprol: May enhance the nephrotoxic effect of Iron Salts. *Risk X: Avoid combination*

H2-Antagonists: May decrease the absorption of Iron Salts. *Risk C: Monitor therapy*

Levodopa: Iron Salts may decrease the absorption of Levodopa. Only applies to oral iron preparations. *Risk D: Consider therapy modification*

Levothyroxine: Ferrous Sulfate may decrease the serum concentration of Levothyroxine. *Risk D: Consider therapy modification*

Methyldopa: Iron Salts may decrease the absorption of Methyldopa. Only oral iron salts are of concern. *Risk D: Consider therapy modification*

Penicillamine: Iron Salts may decrease the absorption of Penicillamine. Only oral iron salts are a concern. *Risk D: Consider therapy modification*

Phosphate Supplements: Iron Salts may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Proton Pump Inhibitors: May decrease the absorption of Iron Salts. *Risk C: Monitor therapy*

Quinolone Antibiotics: Iron Salts may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. *Risk D: Consider therapy modification*

Tetracycline Derivatives: Iron Salts may decrease the absorption of Tetracycline Derivatives. Only a concern with orally administered products. *Risk D: Consider therapy modification*

Trientine: May decrease the serum concentration of Iron Salts. Iron Salts may decrease the serum concentration of Trientine. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsFood: Cereals, dietary fiber, tea, coffee, eggs, and milk may decrease absorption.

Test InteractionsFalse-positive for blood in stool by the guaiac test

Monitoring ParametersSerum iron, total iron binding capacity, reticulocyte count, hemoglobin

Reference Range

Serum iron:

Male: 75-175 mcg/dL (SI: 13.4-31.3 µmol/L)

Female: 65-165 mcg/dL (SI: 11.6-29.5 µmol/L)

Total iron binding capacity: 230-430 mcg/dL

Transferrin: 204-360 mg/dL

Percent transferrin saturation: 20% to 50%

Nursing: Physical Assessment/MonitoringAssess therapeutic response and adverse effects. May cause GI irritation. Monitor GI function (observe for epigastric pain, nausea, dark stools, vomiting, stomach cramping, constipation).

Monitoring: Lab TestsSerum iron, total iron binding capacity, reticulocyte count, hemoglobin

Patient EducationMay color stool black. Take between meals for maximum absorption; take with food if GI upset occurs. Do not take with milk or antacids. You may experience constipation; increasing exercise, fluids, fruit/fiber may help. Keep out of reach of children.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Elixir: 220 mg/5 mL (480 mL) [elemental iron 44 mg/5 mL; contains alcohol]

Liquid, oral drops: 75 mg/0.6 mL (50 mL) [elemental iron 15 mg/0.6 mL]

Fer-Gen-Sol: 75 mg/0.6 mL (50 mL) [elemental iron 15 mg/0.6 mL]

Fer-In-Sol®: 75 mg/1 mL (50 mL) [elemental iron 15 mg/1 mL; contains alcohol 0.2% and sodium bisulfite]

Fer-Iron®: 75 mg/0.6 mL (50 mL) [elemental iron 15 mg/0.6 mL]

Suspension, oral [drops]:

MyKidz Iron 10™: 75 mg/1.5 mL [elemental iron 15 mg/1.5 mL] (118 mL) [contains propylene glycol; ethanol free, dye free; strawberry-banana flavor]

Tablet: 324 mg [elemental iron 65 mg]; 325 mg [elemental iron 65 mg]

Feratab®: 300 mg [elemental iron 60 mg]

Tablet, exsiccated (Feosol®): 200 mg [elemental iron 65 mg]

Tablet, exsiccated, timed release (Slow FE®): 160 mg [elemental iron 50 mg]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Elixir (Ferrous Sulfate)

220 (44 Fe) mg/5 mL (473): $12.99

Solution (Fer-In-Sol)

75 (15 Fe) mg/0.6 mL (50): $18.99

Tablets (Ferrous Sulfate)

325 (65 Fe) mg (100): $8.99

325 (65 Fe) mg (1000): $30.00

Mechanism of ActionReplaces iron, found in hemoglobin, myoglobin, and other enzymes; allows the transportation of oxygen via hemoglobin

Pharmacodynamics/Kinetics

Onset of action: Hematologic response: Oral: ~3-10 days

Peak effect: Reticulocytosis: 5-10 days; hemoglobin increases within 2-4 weeks

Absorption: Iron is absorbed in the duodenum and upper jejunum; in persons with normal serum iron stores, 10% of an oral dose is absorbed; this is increased to 20% to 30% in persons with inadequate iron stores. Food and achlorhydria will decrease absorption

Protein binding: To transferrin

Excretion: Urine, sweat, sloughing of the intestinal mucosa, and menses

Dental Health: Effects on Dental TreatmentDo not prescribe tetracyclines simultaneously with iron since GI tract absorption of both tetracycline and iron may be inhibited. Liquid preparations may temporarily stain the teeth.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentGI side effects are common; concomitant use with SSRIs, carbamazepine, valproic acid, and lithium may produce additive effects

Index Terms$FeSO_4$; Iron Sulfate

Medication Safety Issues

Sound-alike/look-alike issues:

Feridex I.V.® may be confused with Fertinex®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(fer yoo MOX ides)

U.S. Brand NamesFeridex I.V.®

Pharmacologic CategoryRadiological/Contrast Media (Nonionic, Low Osmolality); Radiological/Contrast Media, Paramagnetic Agent

Use: Labeled IndicationsFor I.V. administration as an adjunct to MRI (in adult patients) to enhance the T2 weighted images used in the detection and evaluation of lesions of the liver

Dosing: AdultsAdjunct to MRI: I.V.: 0.56 mg of iron (0.05 mL Feridex I.V.®)/kg body weight diluted in 100 mL of 5% dextrose and infused over 30 minutes; a 5-micron filter is recommended; do not administer undiluted

Dosing: ElderlyRefer to adult dosing.

StorageStore at 2°C to 30°C; do not freeze. If there are indications that package has been frozen, do not use.

ContraindicationsHypersensitivity to parenteral iron, parenteral dextran, parenteral iron dextran, parenteral iron-polysaccharide preparations, or any component of the formulation

Allergy Considerations

- Contrast Agent, Iodinated, Allergy/Hypersensitivity
- Iron Salt Allergy

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic effects were observed in animal studies.

LactationExcretion in breast milk unknown/not recommended

Drug Interactions

Aldesleukin: Contrast Media (Non-ionic) may enhance the potential for allergic or hypersensitivity reactions to Aldesleukin. *Risk C: Monitor therapy*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: Iron 11.2 mg/mL (5 mL) [contains mannitol 61.3 mg/mL]

Generic AvailableNo

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

International Brand NamesEndorem (AT, CH, DE, ES, FI, FR, IT, NO); Feridex (AR); Lumirem (IT)

Special Alerts

Toviaz™ (Fesoterodine) Product Availability

Toviaz™ was approved by the U.S. Food and Drug Administration (FDA) in November 2008. It is expected to be available in the first half of 2009. No specific release date has been announced.

Medication Safety Issues

Sound-alike/look-alike issues:

Fesoterodine may be confused with fexofenadine, tolterodine

Pronunciation(fes oh TER oh deen)
U.S. Brand NamesToviaz™
Pharmacologic CategoryAnticholinergic Agent
Use: Labeled IndicationsTreatment of patients with an overactive bladder with symptoms of urinary frequency, urgency, or urge incontinence.
Dosing: Adults**Overactive bladder:** Oral: 4 mg once daily; dose may be increased to 8 mg once daily based on individual response and tolerability

Dosing adjustment for concomitant CYP3A4 inhibitors: Maximum dose: 4 mg/day when administered concomitantly with potent CYP3A4 inhibitors including (but not limited to) ketoconazole, itraconazole, and clarithromycin. Concurrent therapy of weak or moderate CYP3A4 inhibitors and fesoterodine should be limited to 4 mg/day and increased to 8 mg/day after assessing tolerability.

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal Impairment
Mild-to-moderate renal impairment (Cl_{cr} 30-80 mL/minute): No dose adjustment is recommended.

Severe renal impairment (Cl_{cr} <30 mL/minute): Maximum dose: 4 mg.

Dosing: Hepatic Impairment

Moderate hepatic impairment (Child-Pugh class B): No dose adjustment is recommended.

Severe hepatic impairment (Child-Pugh class C): Use is not recommended; not studied in severe impairment.

Calculations

- Creatinine Clearance: Adults

Administration: OralMay be administered with or without food. Swallow whole; do not chew, crush, or divide.
Dietary ConsiderationsMay be taken with or without food.
StorageStore at 20°C to 25°C (68°F to 77°F); excursions permitted between 15°C to 30°C (59°F to 86°F). Protect from moisture.
ContraindicationsHypersensitivity to fesoterodine or any component of the formulation; urinary retention; gastric retention; uncontrolled narrow-angle glaucoma
Warnings/Precautions

Concerns related to adverse effects:

- CNS effects: Anticholinergics may cause drowsiness and/or blurred vision, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Heat prostration: May occur in the presence of increased environmental temperature; use caution in hot weather and/or exercise.

Disease-related concerns:

- Bladder flow obstruction: Use with caution in patients with bladder flow obstruction; may increase the risk of urinary retention.

- Gastrointestinal obstructive disorders: Use with caution in patients with decreased GI motility or gastrointestinal obstructive disorders (ie, pyloric stenosis); may increase the risk of gastric retention.

- Glaucoma: Use with caution in patients with controlled (treated) narrow-angle glaucoma.

- Hepatic impairment: No dosing adjustments recommended for patients with mild or moderate hepatic impairment. No studies have been performed in patients with severe hepatic impairment (Child-Pugh class C); use is not recommended in this population.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis.

- Renal impairment: Use with caution in patients with renal impairment. Dose adjustment recommended in patients with severe renal impairment (Cl_{cr} <30 mL/minute). There are no dosing adjustments for patients with mild-to-moderate renal impairment.

Concurrent drug therapy issues:

- High potential for interactions: Doses >4 mg are not recommended in patients receiving potent CYP3A4 inhibitors. Concurrent therapy of weak or moderate CYP3A4 inhibitors and fesoterodine should be limited to 4 mg and increased to 8 mg after assessing tolerability.

Special populations:

- Elderly: Use caution in elderly patients (>75 years of age); risk of adverse effects may be increased.

- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic effects were observed in some animal studies. There are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if the potential benefit to the mother outweighs the possible risk to the fetus.

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

>10%: Gastrointestinal: Xerostomia (19% to 35%; dose related)

1% to 10%:

Central nervous system: Insomnia (1%)

Dermatological: Rash (1%)

Gastrointestinal: Constipation (4% to 6%), dyspepsia (2%), nausea (1% to 2%), abdominal pain (1%)

Genitourinary: Urinary tract infection (3% to 4%), dysuria (1% to 2%), urinary retention (1%)

Hepatic: ALT increased (1%), GGT increased (1%)

Neuromuscular & skeletal: Back pain (1% to 2%)

Ocular: Dry eyes (1% to 4%)

Respiratory: Upper respiratory tract infection (2% to 3%), cough (1% to 2%), dry throat (1% to 2%)

Miscellaneous: Peripheral edema (1%)

<1%: Angina, blurred vision, chest pain, diverticulitis, gastroenteritis, heart rate increased (dose related), heat prostration, irritable bowel syndrome, QT_c prolongation

Drug Interactions

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Adverse effects may be potentiated

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, extended release:

Toviaz™: 4 mg, 8 mg

Generic AvailableNo

ManufacturerSchwarz Pharma

Mechanism of ActionFesoterodine acts as a prodrug and is converted to an active metabolite, 5-hydroxymethyl tolterodine (5-HMT); 5-HMT is responsible for fesoterodine’s antimuscarinic activity and acts as a competitive antagonist of muscarinic receptors.

Urinary bladder contractions are mediated by muscarinic receptors; fesoterodine inhibits the receptors in the bladder preventing symptoms of urgency and frequency.

Pharmacodynamics/Kinetics

Absorption: Well absorbed

Distribution: I.V.: 5-HMT: V_d: 169 L

Protein binding: 5-HMT: ~50% (primarily to albumin and alpha$_1$-acid glycoprotein)

Metabolism: Fesoterodine is rapidly and extensively metabolized to its active metabolite (5-hydroxymethyl tolterodine; 5-HMT) by nonspecific esterases; 5-HMT is further metabolized via CYP2D6 and CYP3A4 to inactive metabolites.

Bioavailability: 5-HMT: 52%

Half-life elimination: ~7 hours

Time to peak, plasma: 5-HMT: ~5 hours; C_{max} higher in poor CYP2D6 metabolizers

Excretion: Urine (~70%; 16% as 5-HMT, ~53% as inactive metabolites); feces (7%)

Index Terms FESO; Fesoterodine Fumarate

Medication Safety Issues

Sound-alike/look-alike issues:

Allegra-D® may be confused with Viagra®

Pronunciation(feks oh FEN a deen & soo doe e FED rin)

U.S. Brand NamesAllegra-D® 12 Hour; Allegra-D® 24 Hour

Canadian Brand NamesAllegra-D®

Pharmacologic CategoryAlpha/Beta Agonist; Histamine H_1 Antagonist; Histamine H_1 Antagonist, Second Generation

Use: Labeled IndicationsRelief of symptoms associated with seasonal allergic rhinitis in adults and children ≥12 years of age

Dosing: AdultsAllergic symptoms and nasal congestion: Oral:

Allegra-D® 12 Hour: One tablet twice daily

Allegra-D® 24 Hour: One tablet once daily

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricChildren ≥12 years: Refer to adult dosing.

Dosing: Renal Impairment

Allegra-D® 12 Hour: Cl_{cr} <80 mL/minute (based on fexofenadine component): One tablet once daily.

Allegra-D® 24 Hour: Avoid use.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralTablets should be swallowed whole; do not crush or chew. Administer with water.

ContraindicationsHypersensitivity to fexofenadine, pseudoephedrine, or any component of the formulation; narrow-angle glaucoma; urinary retention; during or within 14 days of MAO inhibitor therapy; severe hypertension or coronary heart disease

Warnings/Precautions

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease); contraindicated with severe disease.
- Diabetes: Use with caution in patients with diabetes mellitus.
- Increased intraocular pressure: Use with caution in patients with increased intraocular pressure.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Renal impairment: Use with caution in patients with renal impairment.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal studies using this combination showed reduced fetal weight, delayed ossification, and decreased survival. Also refer to individual monographs.

LactationEnters breast milk/use caution (AAP rates “compatible”)

Breast-Feeding ConsiderationsPseudoephedrine is excreted in breast milk; excretion of fexofenadine is not known. Also refer to individual monographs. The AAP considers both agents to be usually “compatible” with breast-feeding.

Adverse ReactionsSee individual agents.

Metabolism/Transport EffectsFexofenadine: **Substrate** of CYP3A4 (minor); **Inhibits** CYP2D6 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Antacids: May decrease the serum concentration of Fexofenadine. Management: No specific recommendations concerning the time required between their administration are provided. Separate administration of each agent by as much time as possible to decrease the risk of an interaction. **Exceptions:** Calcium Carbonate; Magaldrate; Sodium Bicarbonate. *Risk D: Consider therapy modification*

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the tachycardic effect of Alpha-/Beta-Agonists. Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor) may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Erythromycin: May increase the serum concentration of Fexofenadine. *Risk C: Monitor therapy*

Grapefruit Juice: May decrease the serum concentration of Fexofenadine. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Ketoconazole: May increase the serum concentration of Fexofenadine. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Rifampin: May decrease the serum concentration of Fexofenadine. *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Verapamil: May increase the bioavailability of Fexofenadine. *Risk C: Monitor therapy*

Nursing: Physical Assessment/MonitoringSee individual agents.
Patient EducationSee individual agents.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, extended release:

Allegra-D® 12 Hour: Fexofenadine hydrochloride 60 mg [immediate release] and pseudoephedrine hydrochloride 120 mg [extended release]

Allegra-D® 24 Hour: Fexofenadine hydrochloride 180 mg [immediate release] and pseudoephedrine hydrochloride 240 mg [extended release]

Generic AvailableNo
Pricing: U.S. (www.drugstore.com)

Tablet, 12-hour (Allegra-D 12 Hour)

60-120 mg (30): $68.66

U.S. Brand NamesAllegra®; Allegra® ODT

Canadian Brand NamesAllegra®

Pharmacologic CategoryHistamine H_1 Antagonist; Histamine H_1 Antagonist, Second Generation

Use: Labeled IndicationsRelief of symptoms associated with seasonal allergic rhinitis; treatment of chronic idiopathic urticaria

Dosing: Adults

Allergic rhinitis, idiopathic urticaria: Oral: 60 mg twice daily **or** 180 mg once daily

Dosing: ElderlyChronic idiopathic urticaria, seasonal allergic rhinitis: Starting dose: 60 mg once daily; adjust for renal impairment.

Dosing: Pediatric

Chronic idiopathic urticaria: Oral:

Children 6 months to <2 years: 15 mg twice daily

Children 2-11 years: 30 mg twice daily

Children ≥12 years: Refer to adult dosing.

Allergic rhinitis: Oral:

Children 2-11 years: Oral: 30 mg twice daily

Children ≥12 years: Refer to adult dosing.

Dosing: Renal ImpairmentCl_{cr} <80 mL/minute:

Children 6 months to <2 years: Initial: 15 mg once daily

Children 2-11 years: Initial: 30 mg once daily

Children ≥12 years and Adults: Initial: 60 mg once daily

Not effectively removed by hemodialysis

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: Oral

Suspension, tablet: Administer with water only; do not administer with fruit juices. Shake suspension well before use.

Orally disintegrating tablet: Take on an empty stomach. Do not remove from blister pack until administered. Using dry hands, place immediately on tongue. Tablet will dissolve within seconds, and may be swallowed with or without liquid. Do not split or chew.

Dietary Considerations Allegra® ODT 30 mg contains phenylalanine 5.3 mg/tablet.

StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F). Protect from excessive moisture.

ContraindicationsHypersensitivity to fexofenadine or any component of the formulation

Warnings/Precautions

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment recommended.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <6 months of age; orally disintegrating tablet not recommended for use in children <6 years of age.

Dosage form specific issues:

- Orally disintegrating tablet: Contains phenylalanine.

Geriatric ConsiderationsPlasma levels in the elderly are generally higher than those observed in other age groups. Once daily dosing is recommended when starting therapy in elderly patients or patients with decreased renal function.
Pregnancy Risk FactorC
Pregnancy ConsiderationsDecreased fetal weight gain and survival were observed in animal studies. There are no adequate and well-controlled studies in pregnant women; use during pregnancy only if potential benefit to mother outweighs possible risk to fetus.
LactationExcretion in breast milk unknown/use caution (AAP rates “compatible”)
Adverse Reactions

>10%:

Central nervous system: Headache (5% to 11%)

Gastrointestinal: Vomiting (children 6 months to 5 years: 4% to 12%)

1% to 10%:

Central nervous system: Fatigue (1% to 3%), somnolence (1% to 3%), dizziness (2%), fever (2%), pain (2%), drowsiness (1%)

Endocrine & metabolic: Dysmenorrhea (2%)

Gastrointestinal: Dyspepsia (1% to 2%), diarrhea (3% to 4%), nausea (2%)

Neuromuscular & skeletal: Myalgia (3%), back pain (2% to 3%), pain in extremities (2%)

Otic: Otitis media (2% to 4%)

Respiratory: Upper respiratory tract infection (3% to 4%), cough (2% to 4%), rhinorrhea (1% to 2%)

Miscellaneous: Viral infection (3%)

<1%, postmarketing, and/or case reports: Hypersensitivity reactions (anaphylaxis, angioedema, chest tightness, dyspnea, flushing, pruritus, rash, urticaria); insomnia, nervousness, sleep disorders, paroniria

Metabolism/Transport Effects**Substrate** of CYP3A4 (minor); **Inhibits** CYP2D6 (weak)
Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Antacids: May decrease the serum concentration of Fexofenadine. Management: No specific recommendations concerning the time required between their administration are provided. Separate administration of each agent by as much time as possible to decrease the risk of an interaction. **Exceptions:** Calcium Carbonate; Magaldrate; Sodium Bicarbonate. *Risk D: Consider therapy modification*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Erythromycin: May increase the serum concentration of Fexofenadine. *Risk C: Monitor therapy*

Grapefruit Juice: May decrease the serum concentration of Fexofenadine. *Risk C: Monitor therapy*

Ketoconazole: May increase the serum concentration of Fexofenadine. *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Rifampin: May decrease the serum concentration of Fexofenadine. *Risk C: Monitor therapy*

Verapamil: May increase the bioavailability of Fexofenadine. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (although limited with fexofenadine, may increase risk of sedation).

Food: Fruit juice (apple, grapefruit, orange) may decrease bioavailability of fexofenadine by ~36%.

Herb/Nutraceutical: St John's wort may decrease fexofenadine levels.

Monitoring ParametersRelief of symptoms

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor effectiveness of therapy and adverse reactions at beginning of therapy and periodically with long-term use. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationTake as directed; do not exceed recommended dose. Store at room temperature in a dry place. If taking antacids, separate administration of antacid and this medication. Avoid use of other depressants, alcohol, or sleep-inducing medications unless approved by prescriber. You may experience mild drowsiness or dizziness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or nausea (small frequent meals, frequent mouth care, chewing gum, or sucking hard candy may help). Report persistent sedation or drowsiness, menstrual irregularities, or lack of improvement or worsening or condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Suspension, oral, as hydrochloride:

Allegra®: 6 mg/mL (30 mL [DSC], 300 mL) [contains propylene glycol; raspberry cream]

Tablet, oral, as hydrochloride: 30 mg, 60 mg, 180 mg

Allegra®: 30 mg [DSC], 60 mg, 180 mg

Tablet, orally disintegrating, oral, as hydrochloride:

Allegra® ODT: 30 mg [contains phenylalanine 5.3 mg/tablet; orange cream flavor]

Generic AvailableYes: Excludes orally disintegrating tablet and suspension

Pricing: U.S. (www.drugstore.com)

Suspension (Allegra)

30 mg/5 mL (300): $68.67

Tablet, orally-disintegrating (Allegra ODT)

30 mg (60): $109.99

Tablets (Allegra)

30 mg (60): $51.99

60 mg (60): $99.00

180 mg (30): $79.99

Mechanism of ActionFexofenadine is an active metabolite of terfenadine and like terfenadine it competes with histamine for H_1-receptor sites on effector cells in the gastrointestinal tract, blood vessels and respiratory tract; it appears that fexofenadine does not cross the blood brain barrier to any appreciable degree, resulting in a reduced potential for sedation

Pharmacodynamics/Kinetics

Onset of action: 60 minutes

Duration: Antihistaminic effect: ≥12 hours

Protein binding: 60% to 70%, primarily albumin and alpha_1-acid glycoprotein

Metabolism: Minimal (~5%)

Half-life elimination: 14.4 hours (31% to 72% longer in renal impairment)

Time to peak, serum: ODT: 2 hours (4 hours with high-fat meal); Tablet: ~2.6 hours; Suspension: ~1 hour

Excretion: Feces (~80%) and urine (~11%) as unchanged drug

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness or dizziness

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsFexofenadine Hydrochloride

Fibrin Sealant Kit

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(FI brin SEEL ent kit)
U.S. Brand NamesEvicel™; Tisseel® VH
Canadian Brand NamesTisseel® VH
Pharmacologic CategoryHemostatic Agent
Use: Labeled Indications

Evicel™: Adjunct to hemostasis in surgery when control of bleeding by conventional surgical techniques is ineffective or impractical

Tisseel® VH: Adjunct to hemostasis in cardiopulmonary bypass surgery and splenic injury (due to blunt or penetrating trauma to the abdomen) when the control of bleeding by conventional surgical techniques is ineffective or impractical; adjunctive sealant for closure of colostomies; hemostatic agent in heparinized patients undergoing cardiopulmonary bypass

Dosing: AdultsAdjunct to hemostasis: Apply topically in an even, thin layer (do not inject directly into circulatory system); actual dose is based on size of surface to be covered:

Evicel™: Spray or drop onto surface of bleeding tissue in short bursts (0.1-0.2 mL); if hemostatic effect is not complete, apply a second layer. To cover a layer of 1 mm thickness:

Maximum area to be sealed: 20 cm^2

Required size of Evicel™ kit: 2 mL

Maximum area to be sealed: 40 cm^2

Required size of Evicel™ kit: 4 mL

Maximum area to be sealed: 100 cm^2

Required size of Evicel™ kit: 10 mL

Tisseel® VH: Adults: Apply in thin layers to avoid excess formation of granulation tissue and slow absorption of the sealant. Following application, hold the sealed parts in the desired position for 3-5 minutes. To prevent sealant from adhering to gloves or surgical instruments, wet them with saline prior to contact.

Maximum area to be sealed: 8 cm^2

Required package size of Tisseel® VH: 2 mL

Maximum area to be sealed: 16 cm^2

Required package size of Tisseel® VH: 4 mL

Maximum area to be sealed: 40 cm^2

Required package size of Tisseel® VH: 10 mL

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricAdjunct to hemostasis: Topical (Evicel™): Refer to adult dosing.
Administration: Topical

Evicel™: Solution should be sprayed or dripped on the tissue to produce an even, thin layer. Application with provided device allows for the simultaneous application of both solutions. Apply spray with provided air tube; distance between nozzle and tissue surface should be 10-15 cm. Apply drops keeping applicator close to, but not touching tissue surface; do not inject directly into circulatory system.

Tisseel® VH: Apply in thin layers to avoid excess formation of granulation tissue and slow absorption of the sealant. Following application, hold the sealed parts in the desired position for 3-5 minutes. To prevent sealant from adhering to gloves or surgical instruments, wet them with saline prior to contact.

Storage

Evicel™: Store frozen at or below -18°C; unopened vials may be stored at 2°C to 8°C (35°F to 46°F) for up to 30 days or up to 24 hours at room temperature. Vials should be thawed prior to use; do not refreeze; if thawed at room temperature, do not re-refrigerate; do not exceed 10 minutes at 37°F.

Tisseel® VH, freeze dried: Store at 2°C to 25°C (35°F to 77°F); do not freeze.

Tisseel® VH, prefilled syringe: Store frozen at or below -20°C. Unopened pouches may be stored for up to 48 hours at room temperature. Do not expose to temperatures >37°C. Do not microwave. Do not refrigerate or refreeze.

Reconstitution

Evicel™: Thaws within 1 day under refrigeration at 2°C to 8°C (35°F to 46°F); within 1 hour at room temperature (20°C to 25°C) or within 10 minutes at 37°F (do not exceed 37°F; do not exceed 10 minutes at 37°F). Draw up equal volumes of each vial into application device.

Tisseel® VH, freeze dried: Solution may be prepared by reconstituting the freeze-dried sealer protein concentrate using the Fibrinotherm® (preferred method), a water bath, or an incubator. The thrombin solution is prepared separately. The two solutions are then transferred to the sterile field and applied to the affected area using the Duploject® syringe system. Application must be done within 4 hours of preparing the solution. Total reconstitution time may take up to 40 minutes.

To reconstitute the sealer protein: Fibrinotherm® method: The Fibrinotherm® is a combined heating and stirring device that can be obtained from the manufacturer. After removing the caps from the sealer concentrate and the fibrinolysis inhibitor solution, disinfect with a germicidal solution that does **not** contain iodine. Turn on the stirring switch of the Fibrinotherm® and insert each vial into the appropriate openings. Turn on the heating switch. The vials will automatically preheat at 37°C for 10 minutes. Transfer the fibrinolysis inhibitor solution into the vial of sealer protein concentrate. Use the adapter to insert the vial into the largest opening of the Fibrinotherm®. Stir contents for 8-10 minutes. If total dissolution has not occurred within 20 minutes, discard and prepare a fresh kit. If not used promptly, keep the solution at 37°C. Stir again shortly before drawing up solution.

Preparation of thrombin solution: After removing the caps from the calcium chloride and thrombin vials, disinfect with a germicidal solution that does **not** contain iodine. Add the calcium chloride to the thrombin vial. Swirl briefly. Keep the prepared solution at 37°C until use.

Note: Prior to application, the sealer protein solution and the thrombin solution should be transferred to a sterile field. To do this, the scrub nurse should withdraw the solution into the provided syringes, while the circulating nurse holds the vials. Withdraw solutions slowly to reduce the possible formation of large air bubbles.

Preparation of the final solution: The two resulting solutions are then placed into the Duploject® system, comprised of two identical disposable syringes, provided in the kit. The syringes have a common plunger, which allows equal volumes of both solutions to be fed through a joining piece, mixed, and ejected through a common application needle. Both syringes should contain equal volumes of solution. Do not expel any air bubbles (may clog). If the application process is interrupted, immediately prior to resuming application, replace the needle with one of the three spare needles provided in the kit. Discard any remaining solution.

Tisseel® VH, prefilled syringe: Thaw in water bath or incubator, following manufacturer guidelines; do not remove protective syringe cap until fully thawed and warmed. Application must be completed within 4 hours of preparing the solution.

Contraindications

Evicel™: Anaphylactic or severe systemic reaction to human blood products; severe or brisk arterial bleeding

Tisseel® VH: Hypersensitivity to bovine protein or aprotinin; direct injection into blood vessels

Warnings/Precautions

Dosage form specific issues:

- Human plasma: Components of the kit made from human plasma may potentially transmit disease. Any infection suspected of being transmitted by this product should be reported to the manufacturer.
- Tisseel® VH: Do not apply to wound surface containing alcohol, iodine, or heavy-metal ions. Do not use with oxycellulose-containing preparations. May contain bovine source fibrinolysis inhibitor solution (aprotinin). Use caution when applying with pressurized gas, may cause air embolism, tissue rupture or gas entrapment with compression. Safety and efficacy in neurologic procedures (or other procedures within a confined space) have not been established. Safety and efficacy in pediatric patients have not been established.

Other warnings/precautions:

- Administration: For topical use only; do not inject into a vessel or tissue; intravascular administration may result in serious or life-threatening thromboembolic or allergic/anaphylactoid reaction.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted. There are no adequate and well-controlled studies in pregnant women.

Adverse ReactionsMay be related to aprotinin contained in some products. Frequency may vary by product.

Cardiovascular: Bradycardia (≤10%)

<1%, postmarketing and/or case reports: Hypersensitivity including anaphylactoid or anaphylactic reactions (0.5/100,000 exposures), dyspnea, flushing, hypotension, nausea, paralysis, pruritus, shock, thromboembolic complications, urticaria

Drug InteractionsThere are no known significant interactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Kit:

Evicel™ [preservative free; each 2 mL kit contains]:

Solution, topical: Fibrinogen 55-85 mg/mL (1 mL) [human derived]

Solution, topical: Thrombin 800-1200 int. units/mL [human derived] and calcium chloride 5.6-6.2 mg/mL (1 mL) [contains albumin]

[each kit also contains a spray application device]

Evicel™ [preservative free; each 4 mL kit contains]:

Solution, topical: Fibrinogen 55-85 mg/mL (2 mL) [human derived]

Solution, topical: Thrombin 800-1200 int. units/mL [human derived] and calcium chloride 5.6-6.2 mg/mL (2 mL) [contains albumin]

[each kit also contains a spray application device]

Evicel™ [preservative free; each 10 mL kit contains]:

Solution, topical: Fibrinogen 55-85 mg/mL (5 mL) [human derived]

Solution, topical: Thrombin 800-1200 int. units/mL [human derived] and calcium chloride 5.6-6.2 mg/mL (5 mL) [contains albumin]

[each kit also contains a spray application device]

Tisseel VH [each 2 mL, 4 mL, or 10 mL kit contains]:

Powder, for solution, topical: Fibrinogen 67-106 mg/mL [human derived; contains polysorbate 80]

Powder, for solution, topical: Thrombin 400-625 int. units/mL [human derived]

Solution, topical: Calcium chloride 36-44 µmol/mL [for thrombin reconstitution]

Solution, topical: Aprotinin 2250-3750 KIU/mL [fibrinolysis inhibitor; synthetic or bovine derived; for fibrinogen reconstitution]

[packaged with Duploject system or Duploject Easyprep]

Tisseel VH [each dual-chamber 2 mL, 4 mL, or 10 mL prefilled syringe contains]:

Solution, topical:

Sealer protein chamber: Fibrinogen 67-106 mg/mL [human derived; contains polysorbate 80] and aprotinin 2250-3750 KIU/mL [fibrinolysis inhibitor; synthetic or bovine derived]

Thrombin chamber: Thrombin 400-625 int. units/mL [human derived] and calcium chloride 36-44 µmol/mL

[packaged with accessory devices]

Generic AvailableNo

Mechanism of ActionFormation of a biodegradable adhesive is done by duplicating the last step of the coagulation cascade, the formation of fibrin from fibrinogen. Fibrinogen is the main component of the sealant solution. The solution also contains thrombin, which transforms fibrinogen from the sealer protein solution into fibrin, and fibrinolysis inhibitor (aprotinin), which prevents the premature degradation of fibrin. When mixed as directed, a viscous solution forms that sets into an elastic coagulum.

Pharmacodynamics/KineticsOnset of action: Tisseel® VH: Time to hemostasis: 5 minutes (65% of patients); Final prepared sealant: 70% strength: ~10 minutes; Full strength: ~2 hours

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsFibrin Sealant (Human); FS

Fibrinogen Concentrate (Human)

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(fi BRIN o gin KON suhn trate HYU man)

U.S. Brand NamesRiaSTAP™

Pharmacologic CategoryBlood Product Derivative

Use: Labeled IndicationsTreatment of acute bleeding episodes in patients with congenital fibrinogen deficiency (afibrinogenemia and hypofibrinogenemia)

Dosing: Adults**Congenital fibrinogen deficiency:** I.V.: **Note:** Adjust dose based on laboratory values and condition of patient. Maintain a target fibrinogen level of 100 mg/dL until hemostasis is achieved.

> When baseline fibrinogen level is known:
>
> > Dose (mg/kg) = [Target level (mg/dL) - measured level (mg/dL)] **divided by** 1.7 (mg/dL per mg/kg body weight)
>
> When baseline fibrinogen level is not known: 70 mg/kg

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Congenital fibrinogen deficiency:** I.V.: Refer to adult dosing.

Administration: I.V.For I.V. administration only; infuse at ≤5 mL/minute

StorageStore at 2°C to 25°C (36°F to 77°F) in original carton; do not freeze. Protect from light. Stable for 24 hours after reconstitution when stored at 20°C to 25°C (68°F to 77°F). Discard partially used vials.

ReconstitutionTransfer sterile water for injection 50 mL into vial. Gently swirl until dissolved; do not shake.

ContraindicationsSevere hypersensitivity reactions to fibrinogen concentrate or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Hypersensitivity: Hypersensitivity reactions (eg, urticaria, hives, wheezing, hypotension, anaphylaxis) may occur. In the event of hypersensitivity reactions, treatment should be discontinued immediately.

- Thrombotic events: Thrombosis may occur in patients with congenital fibrinogen deficiency with or without fibrinogen replacement therapy. Consider potential risk of thrombosis with use.

Dosage form specific issues:

- Human plasma: Product of human plasma; may potentially contain infectious agents which could transmit disease. Screening of donors, as well as testing and/or inactivation or removal of certain viruses, reduces the risk. Infections thought to be transmitted by this product should be reported to the manufacturer.

Other warnings/precautions:

- Appropriate use: Dysfibrinogenemia: Not for the treatment of dysfibrinogenemia.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. Increased pregnancy loss is associated with untreated congenital fibrinogen disorders.

Breast-Feeding ConsiderationsThe use of fibrinogen concentrate has not been studied in nursing women with congenital fibrinogen deficiency.

Adverse Reactions

>1%: Central nervous system: Fever, headache

Postmarketing and/or case reports: Allergic reactions, anaphylaxis, arterial thrombosis, chills, DVT, dyspnea, MI, nausea, pulmonary embolism, rash, thromboembolism, vomiting

Drug Interactions

Antifibrinolytic Agents: May enhance the adverse/toxic effect of Fibrinogen Concentrate (Human). Specifically, the risk for thrombosis may be increased. Fibrinogen Concentrate (Human) may enhance the adverse/toxic effect of Antifibrinolytic Agents. Specifically, the risk for thrombosis may be increased. *Risk C: Monitor therapy*

Monitoring ParametersSigns and symptoms of hypersensitivity, thrombosis; fibrinogen level

Reference RangeA target fibrinogen level of 100 mg/dL should be maintained until hemostasis occurs and wound healing is complete.

Normal fibrinogen levels: 200-450 mg/dL

Monitoring: Lab TestsFibrinogen level

Product AvailabilityRiaSTAP™: FDA approved January 2009; availability currently undetermined

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Injection, powder for reconstitution:

RiaSTAP™: 900-1300 mg [contains albumin (human); exact potency labeled on vial]

Generic AvailableNo

ManufacturerCSL Behring

Mechanism of ActionFibrinogen (coagulation factor I), a protein found in normal plasma, is required to clot blood. Fibrinogen concentrate made from pooled human plasma replaces this protein which is missing or reduced in patients with a congenital fibrinogen deficiency.

Pharmacodynamics/Kinetics

Distribution: V_d: 45-60 mL/kg (range 36-68 mL/kg)

Half-life elimination: 61-97 hours (range 56-117 hours); may be decreased in children <16 years of age

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsCoagulation Factor I

Medication Safety Issues

Sound-alike/look-alike issues:

Neupogen® may be confused with Epogen®, Neumega®, Neupro®, Nutramigen®

Pronunciation(fil GRA stim)
U.S. Brand NamesNeupogen®
Canadian Brand NamesNeupogen®
Pharmacologic Category[Colony Stimulating Factor]
Use: Labeled IndicationsStimulation of granulocyte production in chemotherapy-induced neutropenia (nonmyeloid malignancies, acute myeloid leukemia, and bone marrow transplantation); severe chronic neutropenia (SCN); moblilization of hematopoietic progenitor cells in patients undergoing peripheral blood progenitor cell (PBPC) collection
Use: Unlabeled/InvestigationalTreatment of anemia in myelodysplastic syndrome; treatment of drug-induced (nonchemotherapy) agranulocytosis in the elderly
Dosing: AdultsDetails concerning dosing in combination regimens and institution protocols should also be consulted.

Note: Dosing should be based on actual body weight (even in morbidly obese patients). Rounding doses to the nearest vial size often enhances patient convenience and reduces costs without compromising clinical response.

Chemotherapy-induced neutropenia I.V., SubQ: 5 mcg/kg/day; doses may be increased by 5 mcg/kg according to the duration and severity of the neutropenia; continue for up to 14 days or until the ANC reaches 10,000/mm^3

Bone marrow transplantation: I.V., SubQ: 10 mcg/kg/day; adjust the dose according to the duration and severity of neutropenia; recommended steps based on neutrophil response:

When ANC >1000/mm^3 for 3 consecutive days: Reduce filgrastim dose to 5 mcg/kg/day.

If ANC remains >1000/mm^3 for 3 more consecutive days: Discontinue filgrastim.

If ANC decreases to <1000/mm^3: Resume at 5 mcg/kg/day.

If ANC decreases <1000/mm^3 during the 5 mcg/kg/day dose: Increase filgrastim to 10 mcg/kg/day and follow the above steps.

Peripheral blood progenitor cell (PBPC) collection: SubQ: 10 mcg/kg daily in donors, usually for 6-7 days. Begin at least 4 days before the first leukopheresis and continue until the last leukopheresis; consider dose adjustment for WBC >100,000/mm^3

Hematopoietic stem cell mobilization (in combination with plerixafor, for autologous transplantation in patients with non-Hodgkin's lymphoma and multiple myeloma): SubQ: 10 mcg/kg once daily; begin 4 days before initiation of plerixafor; continue G-CSF on each day prior to apheresis

Severe chronic neutropenia: SubQ:

Congenital: 6 mcg/kg twice daily; adjust the dose based on ANC and clinical response

Idiopathic/cyclic: 5 mcg/kg/day; adjust the dose based on ANC and clinical response

Anemia in myelodysplastic syndrome (unlabeled use - in combination with epoetin): SubQ: 0.3-3 mcg/kg daily **or** 30-150 mcg daily **or** 1-2 mcg/kg 2-3 times weekly

Dosing: ElderlyRefer to adult dosing.

Drug-induced agranulocytosis (nonchemotherapy) in the elderly (unlabeled use): SubQ: 300 mcg daily until ANC >1500/mm^3

Dosing: PediatricChildren: Refer to adult dosing.
Dosing: Combination Regimens

Breast cancer: AC/Paclitaxel (Sequential)

Leukemia, acute myeloid:

FLAG

FLAG-IDA

Lymphoma, non-Hodgkin's:

CODOX-M/IVAC

ICE (Lymphoma, non-Hodgkin's)

RICE

Lymphoma, non-Hodgkin's (Burkitt's): CODOX-M/IVAC

Prostate cancer: Cyclophosphamide + Doxorubicin

Sarcoma, soft tissue: AI

Oncology: Bone Marrow - High Dose5-10 mcg/kg/day
Calculations

- ANC: Absolute Neutrophil Count

Administration: I.V.May be administered by I.V. bolus over 15-30 minutes in D_5W, or by continuous SubQ or I.V. infusion. Do not administer earlier than 24 hours after or in the 24 hours prior to cytotoxic chemotherapy.
Administration: I.V. DetailpH: 4
Administration: OtherMay be administered SubQ.
Dietary ConsiderationsSolution for injection contains sodium 0.035 mg/mL and sorbitol.
StorageIntact vials and prefilled syringes should be stored under refrigeration at 2°C to 8°C (36°F to 46°F) and protected from direct sunlight. Filgrastim should be protected from freezing and temperatures >30°C to avoid aggregation. If inadvertently frozen, thaw in a refrigerator and use within 24 hours; do not use if frozen >24 hours or frozen more than once. Do not shake.

Filgrastim vials and prefilled syringes are stable for 24 hours at 9°C to 30°C (47°F to 86°F).

Undiluted filgrastim is stable for 24 hours at 15°C to 30°C (59°F to 86°F) and for up to 14 days at 2°C to 8°C (36°F to 46°F) (data on file, Amgen Medical Information) in BD tuberculin syringes; however, sterility has only been assessed and maintained for up to 7 days when prepared under strict aseptic conditions (Singh, 1994; Jacobson, 1996). The manufacturer recommends using syringes within 24 hours due to the potential for bacterial contamination.

Filgrastim diluted with D_5W or D_5W with albumin for I.V. infusion (5-15 mcg/mL) is stable for 7 days at 2°C to 8°C (36°F to 46°F), however, should be used within 24 hours due to the possibility for bacterial contamination.

Reconstitution**Do not dilute with saline at any time; product may precipitate.** Filgrastim may be diluted with D_5W or with D_5W with albumin to a concentration of 5-15 mcg/mL for I.V. infusion administration (minimum concentration: 5 mcg/mL). Dilution to <5 mcg/mL is not recommended. Concentrations 5-15 mcg/mL require addition of albumin (final concentration of 2 mg/mL) to prevent adsorption to plastics.
CompatibilityStable in D_5W; **incompatible** with NS.

Y-site administration: Compatible: Acyclovir, allopurinol, amikacin, aminophylline, ampicillin, ampicillin/sulbactam, aztreonam, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, cefazolin, cefotetan, ceftazidime, chlorpromazine, cimetidine, cisplatin, co-trimoxazole, cyclophosphamide, cytarabine, dacarbazine, daunorubicin HCl, dexamethasone sodium phosphate, diphenhydramine, doxorubicin HCl, doxycycline, droperidol, enalaprilat, famotidine, floxuridine, fluconazole, fludarabine, gallium nitrate, ganciclovir, granisetron, haloperidol lactate, hydrocortisone sodium succinate, hydromorphone, hydroxyzine HCl, idarubicin, ifosfamide, leucovorin calcium, lorazepam, mechlorethamine, melphalan, meperidine, mesna, methotrexate, metoclopramide, mitoxantrone, morphine, nalbuphine, ondansetron, potassium chloride, promethazine, ranitidine, sodium bicarbonate, streptozocin, ticarcillin/clavulanate, tobramycin, vancomycin, vinblastine, vincristine, vinorelbine, zidovudine. **Incompatible:** Amphotericin B, cefepime, cefotaxime, cefoxitin, ceftizoxime, ceftriaxone, cefuroxime, clindamycin, dactinomycin, etoposide, fluorouracil, furosemide, heparin, mannitol, methylprednisolone sodium succinate, metronidazole, mitomycin, piperacillin, prochlorperazine edisylate, thiotepa. **Variable (consult detailed reference):** Gentamicin, imipenem/cilastatin.

ContraindicationsHypersensitivity to filgrastim, *E. coli*-derived proteins, or any component of the formulation
Warnings/Precautions

Concerns related to adverse reactions:

- Allergic reactions: Rash, urticaria, wheezing, dyspnea, tachycardia, and/or hypotension have occurred with first or later doses. Reactions tended to occur more frequently with intravenous administration and within 30 minutes of administration.

- Alveolar hemorrhage: Reports of alveolar hemorrhage, manifested as pulmonary infiltrates and hemoptysis, have occurred in healthy donors undergoing PBPC collection (not FDA approved for use in healthy donors); hemoptysis resolved upon discontinuation.

- Cutaneous vasculitis: Has been reported, generally occurring in SCN patients on long-term therapy; dose reductions may improve symptoms to allow for continued therapy.

- Respiratory distress syndrome: Rare cases of acute respiratory distress syndrome have been reported; patients must be instructed to report respiratory distress.

- Splenic rupture: Rare cases of splenic rupture have been reported; patients must be instructed to report left upper quadrant pain or shoulder tip pain.

Disease-related concerns:

- Sickle cell disease: May precipitate sickle cell crises in patients with sickle cell disease; carefully evaluate potential risks and benefits.

Concurrent drug therapy issues:

- Cytotoxic chemotherapy: Do not use filgrastim in the period 24 hours before to 24 hours after administration of cytotoxic chemotherapy because of the potential sensitivity of rapidly dividing myeloid cells to cytotoxic chemotherapy.

- Plerixafor: Increases circulating leukocytes when used in conjunction with plerixafor for stem cell mobilization; monitor WBC; use with caution in patients with neutrophil count >50,000/mm^3. May also release tumor cells from marrow which could be collected in leukapheresis product; potential effect of tumor cell re-infusion is unknown.

Special populations:

- Myelosuppressing chemotherapy recipients: Safety and efficacy have not been established with patients receiving chemotherapy associated with delayed myelosuppression (eg, nitrosoureas, mitomycin C).

- Radiation therapy recipients: Safety and efficacy have not been established with patients receiving radiation therapy.

- Severe congenital neutropenia: Cytogenetic abnormalities, transformation to AML and MDS have been observed in patients treated with filgrastim for congenital neutropenia; a longer duration of treatment and poorer ANC response appear to increase the risk.

Dosage form specific issues:

- Latex: The packaging of some dosage forms may contain latex.

Other warnings/precautions:

- Tumor growth factor: May potentially act as a growth factor for any tumor type, particularly myeloid malignancies; precaution should be exercised when using in any malignancy with myeloid characteristics.

Geriatric ConsiderationsNo specific data available for the elderly.
Pregnancy Risk FactorC
Pregnancy ConsiderationsAnimal studies have demonstrated adverse effects and fetal loss. Filgrastim has been shown to cross the placenta in humans. There are no adequate and well-controlled studies in pregnant women. Use only if potential benefit to mother justifies risk to the fetus.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions

>10%:

Central nervous system: Fever (12%)

Dermatologic: Petechiae (17%), rash (12%)

Gastrointestinal: Splenomegaly (severe chronic neutropenia: 30%; rare in other patients)

Hepatic: Alkaline phosphatase increased (21%)

Neuromuscular & skeletal: Bone pain (22% to 33%), commonly in the lower back, posterior iliac crest, and sternum

Respiratory: Epistaxis (9% to 15%)

1% to 10%:

Cardiovascular: Hyper-/hypotension (4%), S-T segment depression (3%), myocardial infarction/arrhythmias (3%)

Central nervous system: Headache (7%)

Gastrointestinal: Nausea (10%), vomiting (7%), peritonitis (2%)

Hematologic: Leukocytosis (2%)

Miscellaneous: Transfusion reaction (10%)

<1%, postmarketing, and/or case reports: Acute respiratory distress syndrome, allergic reactions, alopecia, alveolar hemorrhage, arthralgia, capillary leak syndrome, cerebral hemorrhage, cutaneous vasculitis, dyspnea, edema (facial), erythema nodosum, hematuria, hemoptysis, hepatomegaly, hypersensitivity reaction, injection site reaction, osteoporosis, pericarditis, proteinuria, psoriasis exacerbation, pulmonary infiltrates, renal insufficiency, sickle cell crisis, splenic rupture, Sweet's syndrome (acute febrile dermatosis), tachycardia, thrombocytopenia (in PBPC mobilization), thrombophlebitis, transient supraventricular arrhythmia, urticaria, wheezing

Oncology: VesicantNo
Oncology: Emetic PotentialLow (10% to 30%)
Drug Interactions

Topotecan: Filgrastim may enhance the adverse/toxic effect of Topotecan. *Risk D: Consider therapy modification*

Test InteractionsMay interfere with bone imaging studies; increased hematopoietic activity of the bone marrow may appear as transient positive bone imaging changes
Monitoring ParametersCBC with differential prior to treatment and twice weekly during filgrastim treatment for chemotherapy-induced neutropenia (3 times a week following marrow transplantation). For severe chronic neutropenia, monitor CBC with differential twice weekly during the first month of therapy and for 2 weeks following dose adjustments; monthly thereafter. In PBPC mobilization, monitor platelets.
Reference RangeNo clinical benefit seen with ANC >10,000/mm^3
Nursing: Physical Assessment/MonitoringAssess for hypersensitivity to *E. coli* products prior to beginning therapy. Assess potential for

interactions with pharmacological agents the patient may be taking that may potentiate the release of neutrophils. Assess results of laboratory tests prior to therapy and as indicated in Laboratory Monitoring. Monitor therapeutic effectiveness and signs/symptoms of adverse reactions at beginning of therapy and periodically throughout therapy (eg, allergic-type reactions have occurred in patients receiving G-CSF with first or later doses). If self-administered, teach patient (or caregiver) proper storage, administration, and syringe/needle disposal. Teach patient (or caregiver) possible side effects/appropriate interventions and adverse symptoms to report (including upper quadrant pain, shoulder tip pain, or respiratory distress - splenic rupture and adult respiratory distress have been reported).

Monitoring: Lab TestsCBC with differential prior to treatment and twice weekly during filgrastim treatment for chemotherapy-induced neutropenia (3 times a week following marrow transplantation). For severe chronic neutropenia, monitor CBC with differential twice weekly during the first month of therapy and for 2 weeks following dose adjustments; monthly thereafter. In PBPC mobilization, monitor platelets.

Patient EducationDo not take any new prescription or over-the-counter medications or herbal products during therapy unless approved by prescriber. If self-administered, follow directions for proper storage and administration of SubQ medication. Never reuse syringes or needles. May cause bone pain (request analgesic); nausea or vomiting (small, frequent meals may help); hair loss (reversible); or sore mouth (frequent mouth care with soft toothbrush or cotton swab may help). Report immediately any respiratory difficulty or pain in left shoulder, chest, or back. Report unusual fever or chills; unhealed sores; severe bone pain; pain, redness, or swelling at injection site; unusual swelling of extremities; or chest pain and palpitations. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

Neupogen®: 300 mcg/mL (1 mL, 1.6 mL) [vial; contains sodium 0.035 mg/mL and sorbitol]

Injection, solution [preservative free]:

Neupogen®: 600 mcg/mL (0.5 mL, 0.8 mL) [prefilled Singleject® syringe; contains sodium 0.035 mg/mL and sorbitol; needle cover contains latex]

Generic AvailableNo

ManufacturerAmgen Inc

Pricing: U.S. (www.drugstore.com)

Solution (Neupogen)

300 mcg/0.5 mL (5): $2653.63

300 mcg/mL (1): $234.62

480 mcg/0.8 mL (8): $4364.06

480 mcg/1.6 mL (16): $3547.96

Mechanism of ActionStimulates the production, maturation, and activation of neutrophils; filgrastim activates neutrophils to increase both their migration and cytotoxicity.

Pharmacodynamics/Kinetics

Onset of action: ~24 hours; plateaus in 3-5 days

Duration: ANC decreases by 50% within 2 days after discontinuing filgrastim; white counts return to the normal range in 4-7 days; peak plasma levels can be maintained for up to 12 hours

Absorption: SubQ: 100%

Distribution: V_d: 150 mL/kg; no evidence of drug accumulation over a 11- to 20-day period

Metabolism: Systemically degraded

Half-life elimination: 1.8-3.5 hours

Time to peak, serum: SubQ: 2-8 hours

Medication Safety Issues

Sound-alike/look-alike issues:

Proscar® may be confused with ProSom®, Prozac®, Psorcon®

Pronunciation(fi NAS teer ide)

U.S. Brand NamesPropecia®; Proscar®

Canadian Brand NamesPropecia®; Proscar®

Pharmacologic Category5 Alpha-Reductase Inhibitor

Use: Labeled Indications

Propecia®: Treatment of male pattern hair loss in **men only**. Safety and efficacy were demonstrated in men between 18-41 years of age.

Proscar®: Treatment of symptomatic benign prostatic hyperplasia (BPH); can be used in combination with an alpha-blocker, doxazosin

Use: Unlabeled/InvestigationalAdjuvant monotherapy after radical prostatectomy in the treatment of prostatic cancer; female hirsutism

Dosing: Adults

Benign prostatic hyperplasia (Proscar®): Oral: 5 mg/day as a single dose; clinical responses occur within 12 weeks to 6 months of initiation of therapy; long-term administration is recommended for maximal response

Male pattern baldness (Propecia®): Oral: 1 mg daily

Female hirsutism (unlabeled use): Oral: 5 mg/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNo adjustment is necessary.

Dosing: Hepatic ImpairmentUse with caution in patients with liver function abnormalities because finasteride is metabolized extensively in the liver

Administration: OralAdministration with food may delay the rate and reduce the extent of oral absorption. Women of childbearing age should not touch or handle broken tablets.

StorageStore below 30°C (86°F). Protect from light.

ContraindicationsHypersensitivity to finasteride or any component of the formulation; pregnancy; not for use in children

Allergy Considerations

- Dutasteride Allergy
- Finasteride Allergy

Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.
- Women/pregnancy: Women can absorb the active ingredient through the skin and should always use caution whenever handling. Pregnant women or women trying to conceive should not handle the product; finasteride may negatively impact fetal development.

Disease-related concerns:

- Diminished urinary flow: Carefully monitor patients with a large residual urinary volume or severely diminished urinary flow for obstructive uropathy; these patients may not be candidates for finasteride therapy.
- Hepatic impairment: Use with caution in patients with hepatic impairment.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: Other urological diseases including cancer should be ruled out before initiating.
- Duration of therapy: A minimum of 6 months of treatment may be necessary to determine whether an individual will respond to finasteride.
- PSA monitoring: Reduces prostate specific antigen (PSA) by 50%; in patients treated for ≥6 months the PSA should be doubled when comparing to normal ranges in untreated patients.

Geriatric ConsiderationsClearance of finasteride is decreased in the elderly, but no dosage reductions are necessary.
Pregnancy Risk FactorX
Pregnancy ConsiderationsAbnormalities of external male genitalia were reported in animal studies. Pregnant women are advised to avoid contact with crushed or broken tablets.
LactationExcretion in breast milk unknown/contraindicated
Breast-Feeding ConsiderationsNot indicated for use in women.
Adverse Reactions**Note:** “Combination therapy” refers to finasteride and doxazosin.

>10%:

Endocrine & metabolic: Impotence (19%; combination therapy 23%), libido decreased (10%; combination therapy 12%)

Neuromuscular & skeletal: Weakness (5%; combination therapy 17%)

1% to 10%:

Cardiovascular: Postural hypotension (9%; combination therapy 18%), edema (1%; combination therapy 3%)

Central nervous system: Dizziness (7%; combination therapy 23%), somnolence (2%; combination therapy 3%)

Genitourinary: Ejaculation disturbances (7%; combination therapy 14%), decreased volume of ejaculate

Endocrine & metabolic: Gynecomastia (2%)

Respiratory: Dyspnea (1%; combination therapy 2%), rhinitis (1%; combination therapy 2%)

<1%, postmarketing, and/or case reports: Hypersensitivity (pruritus, rash, urticaria, swelling of face/lips); breast tenderness, breast enlargement, breast cancer (males), prostate cancer (high grade), testicular pain

Oncology: Emetic PotentialVery low (<10%)
Metabolism/Transport Effects**Substrate** of CYP3A4 (minor)
Drug InteractionsThere are no known significant interactions.
Ethanol/Nutrition/Herb Interactions

Herb/Nutraceutical: St John's wort may decrease finasteride levels. Avoid saw palmetto (concurrent use has not been adequately studied).

Monitoring ParametersObjective and subjective signs of relief of benign prostatic hyperplasia, including improvement in urinary flow, reduction in symptoms of urgency, and relief of difficulty in micturition
Nursing: Physical Assessment/MonitoringAssess potential for interactions with pharmacological agents or herbal products patient may be taking. Assess urinary pattern prior to therapy and periodically during therapy (obstructive uropathy). Assess therapeutic effectiveness and signs/symptoms of adverse reactions. Teach patient proper use (eg, a minimum of 6 months of treatment may be necessary to evaluate response), possible side effects/appropriate interventions, and adverse symptoms to report. **Pregnancy risk factor X** - instruct patient on absolute need for barrier contraceptives. Women of childbearing age should not touch or handle broken tablets.
Monitoring: Lab TestsFinasteride does not interfere with free PSA levels.
Patient EducationDo not take any new medication during therapy unless approved by prescriber. Results of therapy may take several months. Take with or without meals. May cause decreased libido or impotence during therapy. Report any changes in urinary pattern (significant increase or decrease in volume or voiding patterns). Report changes in breast condition (pain, lumps, or nipple discharge) in male and female patients. **Pregnancy precautions:** This drug will cause fetal abnormalities - use barrier contraceptives and do not allow women of childbearing age to touch or handle broken or crushed tablets.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 5 mg

Propecia®: 1 mg

Proscar®: 5 mg

Generic AvailableYes
ManufacturerMerck & Co
Pricing: U.S. (www.drugstore.com)

Tablets (Proscar)

5 mg (30): $95.99

Mechanism of ActionFinasteride is a competitive inhibitor of both tissue and hepatic 5-alpha reductase. This results in inhibition of the conversion of testosterone to dihydrotestosterone and markedly suppresses serum dihydrotestosterone levels
Pharmacodynamics/Kinetics

Onset of action: 3-6 months of ongoing therapy

Duration:

After a single oral dose as small as 0.5 mg: 65% depression of plasma dihydrotestosterone levels persists 5-7 days

After 6 months of treatment with 5 mg/day: Circulating dihydrotestosterone levels are reduced to castrate levels without significant effects on circulating testosterone; levels return to normal within 14 days of discontinuation of treatment

Distribution: V_{dss}: 76 L

Protein binding: 90%

Metabolism: Hepatic via CYP3A4; two active metabolites (<20% activity of finasteride)

Bioavailability: Mean: 63%

Half-life elimination, serum: Elderly: 8 hours; Adults: 6 hours (3-16)

Time to peak, serum: 2-6 hours

Excretion: Feces (57%) and urine (39%) as metabolites

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Anesthesia and Critical Care Concerns/Other ConsiderationsFinasteride may be useful in men with moderately symptomatic BPH who either refuse prostatectomy or are poor surgical candidates. Currently, there is no way to predict which men will respond to finasteride. Treatment with finasteride does not alter the ratio of free to total PSA, which is used to detect prostatic cancer.

Flavocoxid

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(fla vo KOKS id)
U.S. Brand NamesLimbrel™
Pharmacologic CategoryAnti-inflammatory Agent
Use: Labeled IndicationsClinical dietary management of osteoarthritis, including associated inflammation
Dosing: Adults**Management of osteoarthritis:** Oral: 250 mg every 8-12 hours
Dosing: ElderlyRefer to adult dosing.
Dietary ConsiderationsTake on an empty stomach at least 1 hour before or after meals.
StorageStore at 15°C to 30°C (59°F to 86°F).
ContraindicationsHypersensitivity to flavocoxid or any component of the formulation.
Warnings/Precautions

Disease-related concerns:

- Gastrointestinal disease: Use with caution in patients with a history of gastrointestinal disorders; may cause gastrointestinal bleeding or ulceration.

Concurrent drug therapy issues:

- NSAIDs: Avoid concomitant use with NSAIDs.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Experienced physician: Should only be used under the close supervision of a healthcare provider.

Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women.
LactationExcretion in breast milk unknown/not recommended
Adverse Reactions≥2%:

Cardiovascular: Hypertension, varicose veins

Dermatologic: Psoriasis

Gastrointestinal: Occult stools (statistically similar to placebo)

Neuromuscular & skeletal: Fluid on the knee

Metabolism/Transport Effects **Inhibits** CYP1A2 (weak), 2C9 (weak), 2C19 (weak), 2D6 (weak), 3A4 (weak)
Drug InteractionsThere are no known significant interactions.
Nursing: Physical Assessment/MonitoringEvaluate for history of gastrointestinal disorders prior to prescribing. Teach patient proper use and potential side effects/appropriate interventions, and adverse symptoms to report.
Patient EducationTake on an empty stomach 1 hour before or after meals. Do not take other medications (especially aspirin or other nonsteroidal anti-inflammatory medications) without consulting prescriber. Report change in color of stools (black or tarry) blood in vomitus, or persistent abdominal pain.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Limbrel™: 250 mg, 500 mg [gluten free]

Generic AvailableNo
ManufacturerPharmaFab®
Pricing: U.S. (www.drugstore.com)

Capsules (Limbrel)

250 mg (60): $85.99

500 mg (60): $99.97

Mechanism of ActionExerts anti-inflammatory properties through nonspecific inhibition of cyclooxygenase (COX) and lipoxygenase (5-LOX) pathways; may also possess general analgesic and antioxidant/anticytokine properties
Pharmacodynamics/Kinetics

Onset of action: 1-2 hours

Metabolism: Primarily via glucuronidation and sulfation

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported. May enhance risk of bleeding associated with NSAIDs.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentLithium concentrations may be increased with flavocoxid via decreased renal lithium clearance; dose adjustment may be needed

Index TermsFlavan; Flavonoid

Flavoxate

Medication Safety Issues

Sound-alike/look-alike issues:

Flavoxate may be confused with fluvoxamine

Urispas® may be confused with Urised®

Pronunciation(fla VOKS ate)

U.S. Brand NamesUrispas®

Canadian Brand NamesApo-Flavoxate®; Urispas®

Pharmacologic CategoryAntispasmodic Agent, Urinary

Use: Labeled IndicationsAntispasmodic to provide symptomatic relief of dysuria, nocturia, suprapubic pain, urgency, and incontinence due to detrusor instability and hyper-reflexia in elderly with cystitis, urethritis, urethrocystitis, urethrotrigonitis, and prostatitis

Dosing: AdultsUrinary spasms: Oral: 100-200 mg 3-4 times/day; reduce the dose when symptoms improve.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricChildren >12 years: Refer to adult dosing.

Administration: OralShould be administered with water on an empty stomach.

Dietary ConsiderationsShould be taken with water on an empty stomach.

ContraindicationsHypersensitivity to flavoxate; pyloric or duodenal obstruction; GI hemorrhage; GI obstruction; ileus; achalasia; obstructive uropathies of lower urinary tract (BPH)

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Ocular disturbances: May cause ocular disturbances; patients must be advised of potential effects.
- Vertigo: May cause vertigo; patients must be advised of potential effects.

Disease-related concerns:

- Glaucoma: Use with caution in patients with suspected glaucoma.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Geriatric ConsiderationsCaution should be used in the elderly due to anticholinergic activity (eg, confusion, constipation, blurred vision, and tachycardia).

Pregnancy Risk FactorB

LactationExcretion in breast milk unknown

Adverse ReactionsFrequency not defined.

Cardiovascular: Tachycardia, palpitation

Central nervous system: Drowsiness, confusion (especially in the elderly), nervousness, fatigue, vertigo, headache, hyperpyrexia

Dermatologic: Rash. urticaria

Gastrointestinal: Constipation, nausea, vomiting, xerostomia, dry throat

Genitourinary: Dysuria

Hematologic: Leukopenia

Ocular: Increased intraocular pressure, blurred vision

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Cannabinoids: Anticholinergic Agents may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

Potassium Chloride: Anticholinergic Agents may enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Secretin: Anticholinergic Agents may diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).

Monitoring ParametersMonitor I & O closely

Nursing: Physical Assessment/MonitoringAssess kidney function, voiding pattern, incontinent episodes, frequency, urgency/retention, and ophthalmic assessment for glaucoma prior to starting therapy and periodically with long-term therapy. Assess knowledge/teach patient appropriate use, possible side effects/interventions, and adverse symptoms to report.

Patient EducationTake exactly as directed, with water, preferably on an empty stomach, 1 hour before or 2 hours after meals. Do not use alcohol or OTC medications without consulting prescriber. You may experience mild drowsiness, nervousness, or dizziness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, dry mouth (small frequent meals, frequent oral care, chewing gum, or sucking hard candy may help); decreased ability to perspire (avoid extremes of heat); or constipation (increased exercise, fluids, fruit, or fiber may help). Report vision changes (blurred vision); rapid heartbeat; or unresolved nausea, vomiting, or constipation.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as hydrochloride: 100 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Urispas)

100 mg (28): $51.99

Mechanism of ActionSynthetic antispasmotic with similar actions to that of propantheline; it exerts a direct relaxant effect on smooth muscles via phosphodiesterase inhibition, providing relief to a variety of smooth muscle spasms; it is especially useful for the treatment of bladder spasticity, whereby it produces an increase in urinary capacity

Pharmacodynamics/Kinetics

Onset of action: 55-60 minutes

Metabolism: To methyl; flavone carboxylic acid active

Excretion: Urine (10% to 30%) within 6 hours

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation), and dry throat.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness is common; may cause nervousness

Mental Health: Effects on Psychiatric TreatmentNone reported

Flecainide

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Flecainide may be confused with fluconazole

Tambocor™ may be confused with tamoxifen

Pronunciation(fle KAY nide)

U.S. Brand NamesTambocor™

Canadian Brand NamesApo-Flecainide®; Tambocor™

Pharmacologic CategoryAntiarrhythmic Agent, Class Ic

Use: Labeled IndicationsPrevention and suppression of documented life-threatening ventricular arrhythmias (eg, sustained ventricular tachycardia); controlling symptomatic, disabling supraventricular tachycardias in patients without structural heart disease in whom other agents fail

Dosing: Adults

Life-threatening ventricular arrhythmias: Oral:

Initial: 100 mg every 12 hours; increase by 50-100 mg/day (given in 2 doses/day) every 4 days; maximum: 400 mg/day

For patients receiving 400 mg/day who are not controlled and have trough concentrations <0.6 mcg/mL, dosage may be increased to 600 mg/day.

Prevention of paroxysmal supraventricular arrhythmias: Oral: (**Note:** In patients with disabling symptoms but no structural heart disease): Initial: 50 mg every 12 hours; increase by 50 mg twice daily at 4-day intervals; maximum: 300 mg/day

Paroxysmal atrial fibrillation: Outpatient: "Pill-in-the-pocket" dose (unlabeled dose): Oral: 200 mg (weight <70 kg), 300 mg (weight ≥70 kg). May not repeat in ≤24 hours. **Note:** An initial inpatient conversion trial should have been successful before sending patient home on this approach. Patient must be taking an AV nodal-blocking agent (eg, beta-blocker, nondihydropyridine calcium channel blocker) prior to initiation of antiarrhythmic.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Life-threatening ventricular arrhythmias: Oral: Children:

Initial: 3 mg/kg/day or 50-100 mg/m^2/day in 3 divided doses

Usual maintenance: 3-6 mg/kg/day or 100-150 mg/m^2/day in 3 divided doses; up to 11 mg/kg/day or 200 mg/m^2/day for uncontrolled patients with subtherapeutic levels

Dosing: Renal ImpairmentGFR ≤50 mL/minute: Decrease dose by 50%; dose increases should be made cautiously at intervals >4 days and serum levels monitored frequently.

Hemodialysis: No supplemental dose recommended.

Peritoneal dialysis: No supplemental dose recommended.

Dosing: Hepatic ImpairmentMonitoring of plasma levels is recommended because half-life is significantly increased. When transferring from another antiarrhythmic agent, allow for 2-4 half-lives of the agent to pass before initiating flecainide therapy.

Calculations

- Body Surface Area: Pediatrics
- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralAdminister around-the-clock to promote less variation in peak and trough serum levels.

Extemporaneously PreparedA 5 mg/mL suspension compounded from tablets and an oral flavored commercially available diluent (Roxane®) was stable for up to 45 days when stored at 5°C or 25°C in amber glass bottles. Flecainide 20 mg/mL was found stable for up to 60 days at 5°C and 25°C in a 1:1 preparation of Ora-Sweet® and Ora-Plus®, in Ora-Sweet® SF and Ora-Plus® and in cherry syrup

Allen LV and Erickson III MA, "Stability of Baclofen, Captopril, Diltiazem, Hydrochloride, Dipyridamole, and Flecainide Acetate in Extemporaneously Compounded Oral Liquids," *Am J Health Syst Pharm*, 53:2179-84.

Wiest DB, Garner SS, and Pagacz LR, “Stability of Flecainide Acetate in an Extemporaneously Compounded Oral Suspension,” *Am J Hosp Pharm*, 1992, 49(6):1467-70.

ContraindicationsHypersensitivity to flecainide or any component of the formulation; pre-existing second- or third-degree AV block or with right bundle branch block when associated with a left hemiblock (bifascicular block) (except in patients with a functioning artificial pacemaker); cardiogenic shock; coronary artery disease (based on CAST study results); concurrent use of ritonavir or amprenavir

Warnings/Precautions

Boxed warnings:

- Atrial flutter: Appropriate use: See “Disease-related concerns” below.
- CAST trial: See “Other warnings/precautions” below.
- Proarrhythmic effects: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Proarrhythmic effects: **[U.S. Boxed Warning]: Watch for proarrhythmic effects;** monitor and adjust dose to prevent QT_c prolongation. Not recommended for patients with chronic atrial fibrillation.

Disease-related concerns:

- Atrial flutter: Appropriate use: **[U.S. Boxed Warning]: When treating atrial flutter, 1:1 atrioventricular conduction may occur; pre-emptive negative chronotropic therapy (eg, digoxin, beta-blockers) may lower the risk.**
- Conduction disturbances: Use with caution in patients with sick sinus syndrome; dose-related increases in PR and QRS intervals occur.
- Electrolyte imbalance: Correct electrolyte disturbances, especially hypokalemia or hypomagnesemia, prior to use and throughout therapy.
- Heart failure (HF): Use with caution in patients with HF; may precipitate or exacerbate condition.
- Hepatic impairment: Use with caution in patients with significant hepatic impairment.

Other warnings/precautions:

- CAST trial: **[U.S. Boxed Warning]: In the Cardiac Arrhythmia Suppression Trial (CAST), recent (>6 days but <2 years ago) myocardial infarction patients with asymptomatic, non-life-threatening ventricular arrhythmias did not benefit and may have been harmed by attempts to suppress the arrhythmia with flecainide or encainide.** An increased mortality or nonfatal cardiac arrest rate (7.7%) was seen in the active treatment group compared with patients in the placebo group (3%). The applicability of the CAST results to other populations is unknown. The risks of class 1C agents and the lack of improved survival make use in patients without life-threatening arrhythmias generally unacceptable.
- Pacemakers: Use with caution in patients with permanent pacemakers or temporary pacing wires; can increase endocardial pacing thresholds.

Geriatric ConsiderationsDecreased clearance and, therefore, prolonged half-life is possible; however, studies have shown no difference in response to usual doses in the elderly despite slight decrease in clearance; calculate or measure GFR since elderly patients may have GFR ≤50 mL/minute.

Pregnancy Risk FactorC

LactationEnters breast milk/compatible

Adverse Reactions

>10%:

Central nervous system: Dizziness (19% to 30%)

Ocular: Visual disturbances (16%)

Respiratory: Dyspnea (~10%)

1% to 10%:

Cardiovascular: Palpitation (6%), chest pain (5%), edema (3.5%), tachycardia (1% to 3%), proarrhythmic (4% to 12%), sinus node dysfunction (1.2%), syncope

Central nervous system: Headache (4% to 10%), fatigue (8%), nervousness (5%) additional symptoms occurring at a frequency between 1% and 3%: fever, malaise, hypoesthesia, paresis, ataxia, vertigo, somnolence, tinnitus, anxiety, insomnia, depression

Dermatologic: Rash (1% to 3%)

Gastrointestinal: Nausea (9%), constipation (1%), abdominal pain (3%), anorexia (1% to 3%), diarrhea (0.7% to 3%)

Neuromuscular & skeletal: Tremor (5%), weakness (5%), paresthesia (1%)

Ocular: Diplopia (1% to 3%), blurred vision

<1% (Limited to important or life-threatening): Bradycardia, paradoxical increase in ventricular rate in atrial fibrillation/flutter, heart block, increased P-R, QRS duration, ventricular arrhythmia, CHF, flushing, AV block, angina, hyper-/hypotension, amnesia, confusion, decreased libido, depersonalization, euphoria, apathy, nervousness, twitching, neuropathy, weakness, taste disturbance, urticaria, exfoliative dermatitis, pruritus, alopecia, flatulence, xerostomia, blood dyscrasias, possible hepatic dysfunction, paresthesia, eye pain,

photophobia, bronchospasm, pneumonitis, swollen lips/tongue/mouth, arthralgia, myalgia, polyuria, urinary retention, leukopenia, granulocytopenia, thrombocytopenia, metallic taste, alters pacing threshold

Postmarketing and/or case reports: Tardive dyskinesia, corneal deposits

Metabolism/Transport Effects**Substrate** of CYP1A2 (minor), 2D6 (major); **Inhibits** CYP2D6 (weak)
Drug Interactions

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Amiodarone: May decrease the metabolism of Flecainide. *Risk D: Consider therapy modification*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Flecainide. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Ritonavir: May decrease the metabolism of Flecainide. *Risk X: Avoid combination*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Tipranavir: May increase the serum concentration of Flecainide. *Risk X: Avoid combination*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsFood: Clearance may be decreased in patients following strict vegetarian diets due to urinary pH ≥8. Dairy products (milk, infant formula, yogurt) may interfere with the absorption of flecainide in infants; there is one case report of a neonate (GA 34 weeks PNA >6 days) who required extremely large doses of oral flecainide when administered every 8 hours with feedings (“milk feeds”); changing the feedings from “milk feeds” to 5% glucose feeds alone resulted in a doubling of the flecainide serum concentration and toxicity.
Monitoring ParametersECG, blood pressure, pulse, periodic serum concentrations, especially in patients with renal or hepatic impairment
Reference RangeTherapeutic: 0.2-1 mcg/mL; pediatric patients may respond at the lower end of the recommended therapeutic range
Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Monitor cardiac status. Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions when beginning therapy, when titrating dosage, and periodically during long-term therapy. **Note:** Flecainide has a low toxic:therapeutic ratio and overdose may easily produce severe and life-threatening reactions. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.
Monitoring: Lab TestsPeriodic serum concentrations, especially in patients with renal or hepatic impairment
Patient EducationTake exactly as directed, around-the-clock. Do not discontinue without consulting prescriber. You will require frequent monitoring while taking this medication. You may experience lightheadedness, nervousness, dizziness, visual disturbances (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or nausea, vomiting, or loss of appetite (small frequent meals may help). Report palpitations, chest pain, excessively slow or rapid heartbeat; acute nervousness, headache, or fatigue; unusual weight gain; unusual cough; respiratory difficulty; swelling of hands or ankles; or muscle tremor, numbness, or weakness. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as acetate: 50 mg, 100 mg, 150 mg

Generic AvailableYes
Manufacturer3M Pharmaceuticals
Pricing: U.S. (www.drugstore.com)

Tablets (Flecainide Acetate)

50 mg (60): $57.99

100 mg (60): $83.98

150 mg (60): $114.98

Tablets (Tambocor)

50 mg (60): $146.26

100 mg (60): $229.24

150 mg (60): $324.83

Mechanism of ActionClass Ic antiarrhythmic; slows conduction in cardiac tissue by altering transport of ions across cell membranes; causes slight prolongation of refractory periods; decreases the rate of rise of the action potential without affecting its duration; increases electrical stimulation threshold of ventricle, His-Purkinje system; possesses local anesthetic and moderate negative inotropic effects

Pharmacodynamics/Kinetics

Absorption: Oral: Rapid

Distribution: Adults: V_d: 5-13.4 L/kg

Protein binding: Alpha$_1$ glycoprotein: 40% to 50%

Metabolism: Hepatic

Bioavailability: 85% to 90%

Half-life elimination: Infants: 11-12 hours; Children: 8 hours; Adults: 7-22 hours, increased with congestive heart failure or renal dysfunction; End-stage renal disease: 19-26 hours

Time to peak, serum: ~1.5-3 hours

Excretion: Urine (80% to 90%, 10% to 50% as unchanged drug and metabolites)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsFlecainide is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution.

Mental Health: Effects on Mental StatusDizziness is common; may cause sedation; may rarely cause nervousness

Mental Health: Effects on Psychiatric TreatmentUse beta-blockers with caution; may produce additive negative inotropic effect; use caution with TCAs; may affect cardiac conduction; CYP2D6 substrate; use caution with the SSRIs

Cardiovascular ConsiderationsFlecainide is a Class Ic antiarrhythmic with a very narrow therapeutic index and with considerable proarrhythmic properties. The CAST trial, evaluating flecainide in the treatment of asymptomatic ventricular extrasystoles after myocardial infarction, showed a significant increase in mortality. In lower doses, flecainide has sometimes been used for maintenance of sinus rhythm in patients with severe refractory atrial fibrillation, without structural heart disease.

"Pill-in-the Pocket" administration approach: Patients with a history of palpitations with an abrupt onset, were hemodynamically stable, and had 1-12 episodes of atrial fibrillation within the previous year (and no other cardiac symptoms) were candidates for a clinical trial evaluating flecainide or propafenone for conversion of their rhythm (Alboni P, 2004). Patients had to have minimal, if any, heart disease. Only 12% of all patients evaluated for this trial were eligible for inclusion, thus this type of treatment is only for select patients meeting both inclusion and exclusion criteria. However, patients who had met inclusion criteria and were given either flecainide or propafenone in the hospital phase of the trial and converted to normal sinus rhythm were then enrolled into the ambulatory phase of the trial. Patients in this outpatient trial were to take either flecainide or propafenone at the first onset of palpitations. The doses were as follows: Flecainide 300 mg for patients ≥70 kg and 200 mg for patients <70 kg; propafenone 600 mg for patients ≥70 kg and 450 mg for patients <70 kg. Patients were instructed to sit or lie down after taking either drug until palpitations had stopped or for at least 4 hours. If palpitations had not subsided after 6–8 hours, then the patients were instructed to go to the emergency room. They were not to take more than one dose in a 24-hour period. This treatment regimen demonstrated that 94% of episodes in the 165 patients studied were successfully treated with a mean time to symptom resolution of 113 minutes. Adverse events were reported in 12 patients. One patient developed atrial flutter with a rapid ventricular response that required an emergency room visit. The other 11 patients complained of noncardiac side effects (eg, nausea, weakness, and vertigo). This therapy demonstrated a significant reduction in emergency room visits and hospitalization.

Selected patients with infrequent paroxysmal atrial fibrillation may be candidates for the “Pill-in-the-Pocket” regimen. Many patients may not be appropriate candidates for this regimen, based on previous clinical studies – CAST, CAST 2, CASH; a number of exclusion criteria define the potential harm of these agents.

Anesthesia and Critical Care Concerns/Other ConsiderationsBased on adverse outcomes noted with flecainide in the CAST trial, the FDA recommends that use of flecainide be limited to patients with life-threatening ventricular arrhythmias.

Index TermsFlecainide Acetate

Floctafenine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(flok ta FEN een)
Canadian Brand NamesApo-Floctafenine®
Pharmacologic CategoryNonsteroidal Anti-inflammatory Drug (NSAID), Oral
Use: Labeled IndicationsShort-term management of acute, mild-to-moderate pain
Dosing: AdultsPain management: Oral: 200-400 mg every 6-8 hours as needed, up to a maximum of 1200 mg/day
Dosing: ElderlyElderly/debilitated: Initiate therapy with lower than usual adult starting dose; adjust dose when necessary under close observation
Dosing: PediatricDosage not established; use not recommended
Dosing: Renal ImpairmentAlthough no specific recommendations are given, initial doses should be lower than usual adult starting doses; individual adjustments to dose should be made when necessary and under close supervision.
Dosing: Hepatic ImpairmentUse with caution and under close supervision.
Administration: OralAdminister after food or meal with glass of water.
Dietary ConsiderationsShould be taken with food.
StorageStore at room temperature. Protect from light.
RestrictionsNot available in U.S.
ContraindicationsHypersensitivity to floctafenine, aspirin, other NSAIDS, or any component of the formulation; active peptic ulcer or a history of ulcerative disease; inflammatory gastrointestinal disease; severe cardiac insufficiency or ischemic cardiomyopathy; significant hepatic impairment or active liver disease; severely impaired (Cl_{cr} <30 mL/minute) or deteriorating renal function; concurrent use with other NSAIDS; severe heart failure, coronary heart disease; concurrent use with beta-blockers; nasal polyp syndrome (complete or partial); patients who experience “aspirin triad” (bronchial asthma, rhinitis complicated by polyps, aspirin intolerance) with aspirin or NSAID therapy
Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid reactions: Even in patients without prior exposure anaphylactoid reactions may occur; patients with "aspirin triad" (bronchial asthma, aspirin intolerance, rhinitis) may be at increased risk. Do not use in patients who experience bronchospasm, asthma, rhinitis, or urticaria with NSAID or aspirin therapy.

- Aseptic meningitis: Symptoms of aseptic meningitis have been observed with NSAID therapy; patients with autoimmune disorders may be more predisposed.

- Bleeding/hemostasis: Platelet adhesion and aggregation may be decreased; may prolong bleeding time; patients with coagulation disorders or who are receiving anticoagulants should be monitored closely. Anemia may occur; patients on long-term NSAID therapy should be monitored for anemia.

- Cardiovascular events: NSAIDs are associated with an increased risk of adverse cardiovascular events, including MI, stroke, and new onset or worsening of pre-existing hypertension. Risk may be increased with duration of use or pre-existing cardiovascular risk factors or disease. Carefully evaluate individual cardiovascular risk profiles prior to prescribing. Use caution with fluid retention, heart failure, or hypertension. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of cardiovascular events; alternate therapies should be considered for patients at high risk. Use is contraindicated with severe cardiac insufficiency.

- Gastrointestinal events: NSAIDs may increase risk of gastrointestinal irritation, inlammation, ulceration, bleeding, and perforation. These events can sometimes be severe and occasionally fatal and may occur at any time during therapy and without warning. Use caution with concurrent aspirin, anticoagulant and/or corticosteroid therapy, smoking, use of alcohol, the elderly or debilitated patients. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of GI adverse events; alternate therapies should be considered for patients at high risk. Use is contraindicated in patients with active peptic ulcer, history of ulcer disease, or inflammatory GI disease.

- Skin reactions: NSAIDs may cause serious skin adverse events including exfoliative dermatitis, Stevens-Johnson syndrome (SJS), and toxic epidermal necrolysis (TEN); discontinue use at first sign of skin rash or hypersensitivity.

Disease-related concerns:

- Asthma: Do not administer to patients with aspirin-sensitive asthma; severe bronchospasm may occur. Use caution in patients with other forms of asthma.

- Coronary artery bypass graft surgery: Use of NSAIDs is not recommended for treatment of perioperative pain in the setting of coronary artery bypass graft (CABG) surgery. Risk of MI and stroke may be increased with use following CABG surgery.

- Hepatic impairment: Use with caution in patients with decreased hepatic function; contraindicated in patients with severe or active impairment. Closely monitor patients with any abnormal LFT. Severe hepatic reactions (eg, fulminant hepatitis, liver failure) have occurred with NSAID use, rarely; discontinue if signs or symptoms of liver disease develop, or if systemic manifestations occur.

- Renal impairment: NSAID use may compromise existing renal function; dose-dependent decreases in prostaglandin synthesis may result from NSAID use, reducing renal blood flow which may cause renal decompensation. Patients with impaired renal function, dehydration, heart failure, liver dysfunction, those taking diuretics, and ACE inhibitors, and the elderly are at greater risk of renal toxicity. Rehydrate patient before starting therapy; monitor renal function closely. Contraindicated in patients with deteriorating function or severe impairment (Cl_{cr} <30 mL/minute). Long-term NSAID use may result in renal papillary necrosis.

Special populations:

- Elderly: The elderly are at increased risk for adverse effects (especially peptic ulceration, CNS effects, renal toxicity) from NSAIDs even at low doses.
- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Surgical/dental procedures: Withhold for at least 4-6 half-lives prior to surgical or dental procedures.

Pregnancy Risk FactorRisk factor not assigned. Floctafenic acid (active metabolite) crosses the placenta; therefore, the benefits of use must be weighed against risk to mother and fetus.

Pregnancy ConsiderationsIn late pregnancy, NSAIDs may cause premature closure of the ductus arteriosus.

LactationEnters breast milk/not recommended

Adverse ReactionsFrequency not defined.

Cardiovascular: Edema, flushing, tachycardia

Central nervous system: Depression, dizziness, drowsiness, fatigue, headache, insomnia, irritability, malaise, nervousness, vertigo

Dermatologic: Angioedema, pruritus, rash, urticaria

Endocrine & metabolic: Fluid retention, hyperkalemia

Gastrointestinal: Abdominal pain, bitter taste, constipation, diarrhea, dyspepsia, flatulence, gastrointestinal bleeding, gastrointestinal ulcer, gross bleeding with perforation, heartburn, nausea, vomiting, xerostomia

Hematologic: Agranulocytosis, aplastic anemia, bleeding, leukopenia, neutropenia, thrombocytopenia

Hepatic: Hepatotoxicity, liver enzymes increased

Ocular: Blurred and/or diminished vision

Otic: Tinnitus

Renal: Burning micturition, cystitis, dysuria, hematuria, interstitial nephritis, polyuria, reversible acute renal insufficiency with or without oliguria/anuria, strong smelling urine, urethritis

Respiratory: Asthmatic-type dyspnea

Miscellaneous: Anaphylaxis, diaphoresis, thirst

Drug Interactions

ACE inhibitors: Antihypertensive effects may be decreased by concurrent therapy with NSAIDs; monitor blood pressure. Concomitant use may increase risk of renal dysfunction.

Aminoglycosides: Gentamicin and amikacin serum concentrations may be increased by indomethacin in premature infants. Results may apply to other aminoglycosides and NSAIDs.

Angiotensin II receptor blockers: Antihypertensive effects may be decreased by concurrent therapy with NSAIDs; monitor blood pressure. Concomitant use may increase risk of renal dysfunction.

Anticoagulants (warfarin, heparin, LMWHs): In combination with NSAIDs, may increase the risk of bleeding.

Antidepressants, tricyclic, tertiary amine (amitriptyline, clomipramine, doxepin, imipramine, trimipramine): May enhance the antiplatelet effect of non selective NSAIDs.

Antiplatelet drugs (eg, clopidogrel, dipyridamole, eptifibatide): May increase the risk of bleeding.

Beta-blockers: NSAIDs may decrease the antihypertensive effect of beta-blockers; monitor.

Bile acid sequestrants (cholestyramine, colestipol): May decrease the absorption of NSAIDs. Separate administration by at least 2 hours.

Bisphosphonate derivatives (eg, alendronate): NSAIDs (nonselective) may enhance the adverse/toxic effect of bisphosphonate derivatives, an increased incidence of gastrointestinal ulceration is of concern.

Corticosteroids (systemic): May increase the risk of GI ulceration.

Cyclosporine: NSAIDs may enhance the nephrotoxic effect of cyclosporine and may increase the levels/effects of cyclosporine; monitor cyclosporine levels and renal function carefully.

Hydralazine: NSAIDs may diminish the antihypertensive effect of hydralazine.

Lithium: NSAIDs may increase the levels/effects of lithium; avoid concurrent use if possible or monitor lithium levels and adjust dose. Sulindac may have the least effect. When NSAID is stopped, lithium will need adjustment again.

Loop diuretics (eg, bumetanide, furosemide): NSAIDs may diminish the diuretic effect of loop diuretics; patients with heart failure may be more sensitive to alterations in fluid balance, consider avoiding the concomitant use of NSAIDs and loop diuretics; cirrhotic patients with ascites may also be at increased risk.

Methotrexate: NSAIDs may increase the levels/effects of methotrexate. Severe bone marrow suppression, aplastic anemia, and GI toxicity have been reported with concomitant NSAID therapy. Avoid use during moderate or high-dose methotrexate (increased and prolonged methotrexate levels). NSAID use during low-dose treatment of rheumatoid arthritis has not been fully evaluated; extreme caution is warranted.

Pemetrexed: NSAIDs may increase the levels/effects of pemetrexed. In patients with decreased renal function, avoid floctafenine use for 2-5 days before, the day of, and 2 days following a dose of pemetrexed.

Probenecid: May increase levels/effects of NSAIDs.

Quinolone antibiotics: NSAIDs may enhance the neuroexcitatory and/or seizure-potentiating effect of quinolone antibiotics.

Salicylates: NSAIDs (nonselective) may diminish the cardioprotective effect of acetylated salicylates. Avoid regular use of NSAIDs if possible; consider alternatives (eg, acetaminophen). If ibuprofen is used occasionally, give 30 minutes to 2 hours after aspirin. NSAIDs (nonselective) may enhance the antiplatelet effect of salicylates. Salicylates may decrease the levels/effects of NSAID (nonselective).

Selective serotonin reuptake inhibitors (SSRIs): May enhance the antiplatelet effect of NSAID (nonselective).

Thiazide diuretics: NSAIDs may diminish the antihypertensive effect of thiazide diuretics.

Treprostinil: May enhance the adverse/toxic effect of NSAIDs; bleeding may occur.

Vancomycin: NSAIDs may increase the levels/effects of vancomycin.

Warfarin: NSAIDs (nonselective) may enhance the anticoagulant effect of coumarin derivatives; monitor INR closely.

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may enhance gastric mucosal irritation).

Herb/Nutraceutical: Avoid alfalfa, anise, bilberry, bladderwrack, bromelain, cat's claw, celery, chamomile, coleus, cordyceps, dong quai, evening primrose, fenugreek, feverfew, garlic, ginger, ginkgo biloba, ginseng (American, Panax, Siberian), grapeseed, green tea, guggul, horse chestnut seed, horseradish, licorice, prickly ash, red clover, reishi, SAMe (S-adenosylmethionine), sweet clover, turmeric, white willow (all have additional antiplatelet activity).

Monitoring ParametersCBC, liver function tests, renal function (including bun and creatinine); edema; GI effects (eg, abdominal pain, dyspepsia, bleeding); vision

Monitoring: Lab TestsCBC, liver function tests, renal function (bun and creatinine)

Patient EducationIf self-administered, take exactly as directed; do not increase dose or frequency. Take with food or milk to avoid GI irritation. Maintain adequate hydration (2-3 L/day of fluid) unless instructed to restrict fluid intake. Do not use alcohol, aspirin, or aspirin-containing medication without consulting prescriber. You may experience drowsiness or dizziness (use caution when driving or engaging in tasks requiring alertness until response to drug is known), nausea, vomiting, gastric discomfort (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). GI bleeding, ulceration, and perforation can occur with or without pain. Stop taking medication and report occurrence immediately. Report ringing in ears, changes in hearing or vision, unresolved nausea or vomiting, difficulty breathing or shortness of breath, cramping or stomach pain, unusual bruising or bleeding (blood in urine, stool, mouth, or vomitus), unusual swelling of extremities or weight gain (>3-5 pounds/week), chest pain, rapid heartbeat, or skin rash. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Tablet:

Apo-Floctafenine® [CAN]: 200 mg, 400 mg [not available in the U.S.]

Generic AvailableYes

Mechanism of ActionReversibly inhibits cyclooxygenase-1 and 2 (COX-1 and 2) enzymes, which result in decreased formation of prostaglandin precursors; has antipyretic, analgesic, and anti-inflammatory properties

Pharmacodynamics/Kinetics

Duration: 6-8 hours

Absorption: Rapid, well absorbed

Metabolism: Hepatic

Half-life elimination: Initial phase (distribution): 1 hour; second phase (elimination): 8 hours

Time to peak, plasma: 1-2 hours

Excretion: Feces and bile (60%); urine (40%)

Pharmacotherapy PearlsNo interactions have been noted with concomitant administration of antacids.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation), bitter taste.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause depression, dizziness, drowsiness, insomnia, irritability, malaise, or nervousness

Mental Health: Effects on Psychiatric TreatmentMay decrease the clearance of lithium resulting in elevated serum levels and potential toxicity; monitor serum lithium levels. Concomitant use with SSRIs may increase the risk of bleeding; monitor.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Floxuridine may be confused with Fludara®, fludarabine

FUDR® may be confused with Fludara®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(floks YOOR i deen)

U.S. Brand NamesFUDR®

Canadian Brand NamesFUDR®

Pharmacologic CategoryAntineoplastic Agent, Antimetabolite (Pyrimidine Analog)

Use: Labeled IndicationsManagement of hepatic metastases of colorectal and gastric cancers

Dosing: AdultsRefer to individual protocols.

Colorectal or gastric metastases:

Intra-arterial: Primarily by an implantable pump: 0.1-0.6 mg/kg/day continuous intra-arterial administration for 14 days then heparinized saline is given for 14 days; toxicity requires dose reduction.

I.V.: (unlabeled use) Many regimens in use, examples:

0.15 mg/kg/day for 7-14 days

0.5-1 mg/kg/day for 6-15 days

30 mg/kg/day for 5 days, then 15 mg/kg/day every other day, up to 11 days

Dosing: ElderlyAdjust dose since elderly patients are prone to toxicity.

Dosing: Renal ImpairmentThe FDA-approved labeling does not contain dosing adjustment guidelines; use with extreme caution.

Dosing: Hepatic ImpairmentThe FDA-approved labeling does not contain dosing adjustment guidelines; use with extreme caution. The following guidelines have been used by some clinicians (Floyd, 2006):

Serum bilirubin 1.2 times ULN or alkaline phosphatase 1.2 times ULN: Administer 80% of dose

Serum bilirubin 1.5 times ULN; ALT/AST 3 times baseline or alkaline phosphatase 1.5 times ULN: Administer 50% of dose

Serum bilirubin 2 times ULN; ALT/AST >3 times baseline or alkaline phosphatase 2 times ULN: No recommendation is available

Administration: I.V.Continuous intra-arterial or I.V. infusion (unlabeled use)

Administration: I.V. DetailpH: 4.0-5.5

StorageStore intact vials at room temperature of 15°C to 30°C (59°F to 86°F). Reconstituted vials are stable for up to 2 weeks under refrigeration at 2°C to 8°C (36°C to 46°C). Further dilution in 500-1000 mL D_5W or NS is stable for 2 weeks at room temperature. Solutions in 0.9% sodium chloride are stable in some ambulatory infusion pumps for up to 21 days.

ReconstitutionReconstitute with 5 mL SWI for a final concentration of 100 mg/mL. Further dilute in 500-1000 mL D_5W or NS for I.V. infusion.

CompatibilityStable in D_5W, NS, sterile water for injection.

Y-site administration: Compatible: Amifostine, aztreonam, etoposide phosphate, filgrastim, fludarabine, gemcitabine, granisetron, melphalan, ondansetron, paclitaxel, piperacillin/tazobactam, sargramostim, teniposide, thiotepa, vinorelbine. **Incompatible:** Allopurinol, cefepime.

Compatibility when admixed: Compatible: Carboplatin, cisplatin, cisplatin with etoposide, cisplatin with leucovorin, etoposide, fluorouracil, leucovorin.

ContraindicationsHypersensitivity to floxuridine, fluorouracil, or any component of the formulation; pregnancy

Warnings/Precautions

Boxed warnings:

- Experienced physician: See “Other warnings/precautions” below.
- Initiation of therapy: See “Other warnings/precautions” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Toxicity: Discontinue if intractable vomiting, diarrhea, precipitous fall in leukocyte or platelet counts, myocardial ischemia, hemorrhage, gastrointestinal ulcer, or stomatitis occur.

Disease-related concerns:

- Bone marrow suppression: Use with caution in patients with depressed (leukocyte count <5000/mm^3 or platelet count <100,000/mm^3) bone marrow function.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Infection: Use with caution in patients with potentially serious infections.
- Renal impairment: Use with caution in patients with renal impairment.

Concurrent drug therapy issues:

- Alkylating agents: Use with caution in patients who have had previous use of alkylating agents.

Special populations:

- Pelvic radiation recipients: Use with caution in patients who have had high-dose pelvic radiation.
- Poor nutritional status: Use with caution in patients with poor nutritional status.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**
- Initiation of therapy: **[U.S. Boxed Warning]: Patients should be hospitalized for initiation of the first course of therapy due to the risk for severe toxic reactions.**

Pregnancy Risk FactorD
LactationExcretion in breast milk unknown/contraindicated
Adverse Reactions

>10%:

Gastrointestinal: Stomatitis, diarrhea; may be dose limiting

Hematologic: Myelosuppression, may be dose limiting; leukopenia, thrombocytopenia, anemia

Onset: 4-7 days

Nadir: 5-9 days

Recovery: 21 days

1% to 10%:

Dermatologic: Alopecia, photosensitivity, hyperpigmentation of the skin, localized erythema, dermatitis

Gastrointestinal: Anorexia

Hepatic: Biliary sclerosis, cholecystitis, jaundice

<1%: Nausea, vomiting, intrahepatic abscess

Oncology: VesicantNo
Oncology: Emetic PotentialVery low (<10%)
Drug Interactions

Cardiac Glycosides: Antineoplastic Agents may decrease the absorption of Cardiac Glycosides. This may only affect digoxin tablets. **Exceptions:** Digitoxin. *Risk C: Monitor therapy*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Strong) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Phenytoin: Floxuridine may increase the serum concentration of Phenytoin. *Risk D: Consider therapy modification*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vitamin K Antagonists (eg, warfarin): Antineoplastic Agents may enhance the anticoagulant effect of Vitamin K Antagonists. Antineoplastic Agents may diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (due to GI irritation).

Nursing: Physical Assessment/MonitoringUse caution with impaired liver or kidney function. Assess potential for interactions with other pharmacological agents or herbal products patient may be taking. See Administration for infusion specifics. Assess results of laboratory tests, therapeutic effectiveness, and adverse response (eg, CNS changes, acute gastrointestinal reactions [intractable vomiting or diarrhea may be dose limiting]) on a regular basis throughout therapy. Teach patient (caregiver) use and care of implantable pump, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsCBC, platelet count, liver function

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This drug can only be administered by infusion. Follow instructions of prescriber for care of implantable pump. Avoid alcohol. It is important to maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake, and nutrition (small, frequent meals may help). You will be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). May cause nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); loss of hair (reversible); diarrhea (buttermilk, boiled milk, or yogurt may help reduce diarrhea); mouth sores (use a soft toothbrush or cotton swabs for oral care); or sterility. Increased emotional or physical stress will adversely affect the response to this medication. Notify prescriber if you are experiencing unusual or elevated levels of stress. Report extreme fatigue; pain or numbness in extremities; severe GI upset or diarrhea; bleeding or bruising; fever, chills, or sore throat; vaginal discharge; or signs of fluid retention (eg, swelling extremities, respiratory difficulty, unusual weight gain). **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication and for 1 month following therapy. Consult prescriber for appropriate barrier contraceptives. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution: 500 mg

Generic AvailableYes

Mechanism of ActionMechanism of action and pharmacokinetics are very similar to fluorouracil; floxuridine is the deoxyribonucleotide of fluorouracil. Floxuridine is a fluorinated pyrimidine antagonist which inhibits DNA and RNA synthesis and methylation of deoxyuridylic acid to thymidylic acid.

Pharmacodynamics/Kinetics

Metabolism: Hepatic; Active metabolites: Floxuridine monophosphate (FUDR-MP) and fluorouracil; Inactive metabolites: Urea, CO_2, α-fluoro-β-alanine, α-fluoro-β-guanidopropionic acid, α-fluoro-β-ureidopropionic acid, and dihydrofluorouracil

Excretion: Urine: Fluorouracil, urea, α-fluoro-β-alanine, α-fluoro-β-guanidopropionic acid, α-fluoro-β-ureidopropionic acid, and dihydrofluorouracil; exhaled gases (CO_2)

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Stomatitis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness

Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine and carbamazepine

Medication Safety Issues

Sound-alike/look-alike issues:

Fluconazole may be confused with flecainide

Diflucan® may be confused with diclofenac, Diprivan®, disulfiram

International issues:

Canesten® [Great Britain]: Brand name for clotrimazole in multiple international markets

Pronunciation(floo KOE na zole)

U.S. Brand NamesDiflucan®

Canadian Brand NamesApo-Fluconazole®; Co-Fluconazole; Diflucan®; Dom-Fluconazole; Fluconazole Injection; Fluconazole Omega; Gen-Fluconazole; GMD-Fluconazole; Novo-Fluconazole; PHL-Fluconazole; PMS-Fluconazole; Pro-Fluconazole; Riva-Fluconazole; Taro-Fluconazole; Zym-Fluconazole

Pharmacologic CategoryAntifungal Agent, Oral; Antifungal Agent, Parenteral

Use: Labeled IndicationsTreatment of candidiasis (vaginal, oropharyngeal, esophageal, urinary tract infections, peritonitis, pneumonia, and systemic infections); cryptococcal meningitis; antifungal prophylaxis in allogeneic bone marrow transplant recipients

Use: DentalTreatment of susceptible fungal infections in the oral cavity including candidiasis, oral thrush, and chronic mucocutaneous candidiasis treatment of esophageal and oropharyngeal candidiasis caused by *Candida* species; treatment of severe, chronic mucocutaneous candidiasis caused by *Candida* species

Dosing: AdultsThe daily dose of fluconazole is the same for both oral and I.V. administration

Usual dosage range: 200-800 mg daily; duration and dosage depends on severity of infection

Indication-specific dosing:

Candidiasis:

Candidemia (neutropenic and non-neutropenic): 400-800 mg/day for 14 days after last positive blood culture and resolution of signs/symptoms

Chronic, disseminated: 400-800 mg/day for 3-6 months

Oropharyngeal (long-term suppression): 200 mg/day; chronic therapy is recommended in immunocompromised patients with history of oropharyngeal candidiasis (OPC)

Osteomyelitis: 400-800 mg/day for 6-12 months

Esophageal: 200 mg on day 1, then 100-200 mg/day for 2-3 weeks after clinical improvement

Prophylaxis in bone marrow transplant: 400 mg/day; begin 3 days before onset of neutropenia and continue for 7 days after neutrophils >1000 cells/mm^3

Urinary: 200 mg/day for 1-2 weeks

Vaginal: 150 mg as a single dose

Coccidiomycosis (unlabeled use, IDSA guideline): 400 mg/day; doses of 800-1000 mg/day have been used for meningeal disease; usual duration of therapy ranges from 3-6 months for primary uncomplicated infections and up to 1 year for pulmonary (chronic and diffuse) infection

Endocarditis, prosthetic valve, early (unlabeled use, IDSA guideline): 400-800 mg/day for 6 weeks after valve replacement; long-term suppression in absence of valve replacement: 200-400 mg/day

Endophthalmitis: 400-800 mg/day for 6-12 weeks after surgical intervention.

Meningitis, cryptococcal: Amphotericin 0.7-1 mg/kg +/- 5-FC for 2 weeks then fluconazole 400 mg/day for at least 10 weeks (consider life-long in HIV-positive); maintenance (HIV-positive): 200-400 mg/day life-long

Pneumonia, cryptococcal (mild-to-moderate) (unlabeled use, IDSA guideline): 200-400 mg/day for 6-12 months (consider life-long in HIV-positive patients)

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricThe daily dose of fluconazole is the same for oral and I.V. administration

Usual dosage ranges:

Neonates: First 2 weeks of life, especially premature neonates: Same dose as older children every 72 hours

Children: Loading dose: 6-12 mg/kg; maintenance: 3-12 mg/kg/day; duration and dosage depends on severity of infection

Indication-specific dosing:

Candidiasis:

Oropharyngeal: Loading dose: 6 mg/kg; maintenance: 3 mg/kg/day for 2 weeks

Esophageal: Loading dose: 6 mg/kg; maintenance: 3-12 mg/kg/day for 21 days and at least 2 weeks following resolution of symptoms

Systemic infection: 6 mg/kg every 12 hours for 28 days

Meningitis, cryptococcal: Loading dose: 12 mg/kg; maintenance: 6-12 mg/kg/day for 10-12 weeks following negative CSF culture; relapse suppression (HIV-positive): 6 mg/kg/day

Dosing: Renal Impairment

No adjustment for vaginal candidiasis single-dose therapy

For multiple dosing, administer usual load then adjust daily doses as follows:

Cl_{cr} ≤50 mL/minute (no dialysis): Administer 50% of recommended dose or administer every 48 hours.

Hemodialysis: 50% is removed by hemodialysis; administer 100% of daily dose (according to indication) after each dialysis treatment.

Continuous renal replacement therapy (CRRT): Drug clearance is highly dependent on the method of renal replacement, filter type, and flow rate. Appropriate dosing requires close monitoring of pharmacologic response, signs of adverse reactions due to drug accumulation, as well as drug levels in relation to target trough (if appropriate). The following are general recommendations only (based on dialysate flow/ultrafiltration rates of 1 L/hour) and should not supersede clinical judgment:

CVVH: 200-400 mg every 24 hours

CVVHD/CVVHDF: 400-800 mg every 24 hours

Note: Higher daily doses of 400 mg (CVVH) and 800 mg (CVVHD/CVVHDF) should be considered when treating resistant organisms and/or when employing combined ultrafiltration and dialysis flow rates of ≥2 L/hour for CVVHD/CVVHDF (Trotman, 2005).

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.M.For I.V. only; do not administer I.M. or SubQ

Administration: I.V.Infuse over approximately 1-2 hours.

Administration: I.V. DetailDo not use if cloudy or precipitated. Do not exceed 200 mg/hour when administering by I.V. infusion.

pH: 4-8 (sodium chloride diluent); 3.5-6.5 (dextrose)

Administration: OralMay be administered with or without food.

Dietary ConsiderationsTake with or without regard to food.

Storage

Powder for oral suspension: Store dry powder at ≤30°C (86°F). Following reconstitution, store at 5°C to 30°C (41°F to 86°F). Discard unused portion after 2 weeks. Do not freeze.

Injection: Store injection in glass at 5°C to 30°C (41°F to 86°F). Store injection in Viaflex® at 5°C to 25°C (41°F to 77°F). Do not freeze. Do not unwrap unit until ready for use.

CompatibilityStable in D_5W, LR, NS.

Y-site administration: Compatible: Acyclovir, aldesleukin, allopurinol, amifostine, amikacin, aminophylline, ampicillin/sulbactam, aztreonam, benztropine, cefazolin, cefepime, cefotetan, cefoxitin, cefpirome, chlorpromazine, cimetidine, cisatracurium, dexamethasone sodium phosphate, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin liposome, droperidol, etoposide phosphate, famotidine, filgrastim, fludarabine, foscarnet, ganciclovir, gatifloxacin, gemcitabine, gentamicin, granisetron, heparin, hydrocortisone sodium phosphate, immune globulin intravenous, leucovorin, linezolid, lorazepam, melphalan, meperidine, meropenem, metoclopramide, metronidazole, midazolam, morphine, nafcillin, nitroglycerin, ondansetron, oxacillin, paclitaxel, pancuronium, penicillin G potassium, phenytoin, piperacillin/tazobactam, prochlorperazine edisylate, promethazine, propofol, ranitidine, remifentanil, sargramostim, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin/clavulanate, tobramycin, vancomycin, vecuronium, vinorelbine, zidovudine. **Incompatible:** Amphotericin B, amphotericin B cholesteryl sulfate complex, ampicillin, calcium gluconate, cefotaxime, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, clindamycin, co-trimoxazole, diazepam, digoxin, erythromycin lactobionate, furosemide, haloperidol, hydroxyzine, imipenem/cilastatin, pentamidine, piperacillin, ticarcillin.

Compatibility when admixed: Compatible: Acyclovir, amikacin, amphotericin B, cefazolin, ceftazidime, clindamycin, gentamicin, heparin, meropenem, metronidazole, morphine, piperacillin, potassium chloride, ranitidine with ondansetron, theophylline. **Incompatible:** Co-trimoxazole.

ContraindicationsHypersensitivity to fluconazole, other azoles, or any component of the formulation; concomitant administration with cisapride

Allergy Considerations

- Azole Antifungal Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Skin reactions: Rare exfoliative skin disorders have been observed; monitor closely if rash develops.

Disease-related concerns:

- Arrhythmias: The manufacturer reports rare cases of QT_c prolongation and TdP associated with fluconazole use and advises caution in patients with concomitant medications or conditions which are arrhythmogenic. However, given the limited number of cases and the presence of multiple confounding variables, the likelihood that fluconazole causes conduction abnormalities appears remote.

- Hepatic impairment: Serious (and rarely fatal) hepatic toxicity (eg, hepatitis, cholestasis, fulminant failure) has been observed with azole therapy. Use with caution in patients with pre-existing hepatic impairment; monitor liver function closely and dosage adjustment may be warranted; discontinue if symptoms consistent with liver disease develop.

- Renal impairment: Use with caution in patients with renal impairment.

Geriatric ConsiderationsHas not been specifically studied in the elderly.

Pregnancy Risk FactorC

Pregnancy ConsiderationsWhen used in high doses, fluconazole is teratogenic in animal studies. Following exposure during the first trimester, case reports have noted similar malformations in humans when used in higher doses (400 mg/day) over extended periods of time. Use of lower doses (150 mg as a single dose or 200 mg/day) may have less risk; however, additional data is needed. Use during pregnancy only if the potential benefit to the mother outweighs any potential risk to the fetus.

LactationEnters breast/not recommended (AAP rates “compatible”)

Breast-Feeding ConsiderationsFluconazole is found in breast milk at concentration similar to plasma.

Adverse ReactionsFrequency not always defined.

Cardiovascular: Angioedema, pallor, QT prolongation (rare, case reports), torsade de pointes (rare, case reports)

Central nervous system: Headache (2% to 13%), seizure, dizziness

Dermatologic: Rash (2%), alopecia, toxic epidermal necrolysis, Stevens-Johnson syndrome

Endocrine & metabolic: Hypercholesterolemia, hypertriglyceridemia, hypokalemia

Gastrointestinal: Nausea (4% to 7%), vomiting (2%), abdominal pain (2% to 6%), diarrhea (2% to 3%), taste perversion, dyspepsia

Hematologic: Agranulocytosis, leukopenia, neutropenia, thrombocytopenia

Hepatic: Alkaline phosphatase increased, ALT increased, AST increased, cholestasis, hepatic failure (rare), hepatitis, jaundice

Respiratory: Dyspnea

Miscellaneous: Anaphylactic reactions (rare)

Oncology: VesicantNo

Oncology: Emetic PotentialVery low (<10%)

Metabolism/Transport Effects**Inhibits** CYP1A2 (weak), 2C9 (strong), 2C19 (strong), 3A4 (moderate)

Drug Interactions

Alfentanil: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Alfentanil. *Risk D: Consider therapy modification*

Alfentanil: Fluconazole may decrease the metabolism of Alfentanil. *Risk D: Consider therapy modification*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Antacids: May decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). *Risk D: Consider therapy modification*

Aprepitant: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Aprepitant. *Risk C: Monitor therapy*

Benzodiazepines (metabolized by oxidation): Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Benzodiazepines (metabolized by oxidation). **Exceptions:** Quazepam. *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Fluconazole may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Bosentan: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Bosentan. *Risk C: Monitor therapy*

BusPIRone: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of BusPIRone. *Risk D: Consider therapy modification*

Busulfan: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Busulfan. *Risk C: Monitor therapy*

Calcium Channel Blockers: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Calcium Channel Blockers. **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

Calcium Channel Blockers: Fluconazole may decrease the metabolism of Calcium Channel Blockers. **Exceptions:** Clevidipine. *Risk C: Monitor therapy*

CarBAMazepine: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of CarBAMazepine. *Risk C: Monitor therapy*

CarBAMazepine: Fluconazole may decrease the metabolism of CarBAMazepine. *Risk C: Monitor therapy*

Cardiac Glycosides: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Cardiac Glycosides. *Risk D: Consider therapy modification*

Cilostazol: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Cilostazol. *Risk D: Consider therapy modification*

Cinacalcet: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Cinacalcet. *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Cisapride: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Cisapride. *Risk X: Avoid combination*

Conivaptan: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Conivaptan. *Risk X: Avoid combination*

Corticosteroids (Orally Inhaled): Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Corticosteroids (Orally Inhaled). **Exceptions:** Beclomethasone; Flunisolide; Triamcinolone. *Risk C: Monitor therapy*

Corticosteroids (Systemic): Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Corticosteroids (Systemic): Fluconazole may decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CycloSPORINE: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

CycloSPORINE: Fluconazole may decrease the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

CYP2C19 Substrates: CYP2C19 Inhibitors (Strong) may decrease the metabolism of CYP2C19 Substrates. *Risk D: Consider therapy modification*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Strong) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Didanosine: May decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). Enteric coated didanosine capsules are not expected to affect these antifungals. *Risk D: Consider therapy modification*

Docetaxel: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Docetaxel. *Risk D: Consider therapy modification*

Dofetilide: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Dofetilide. *Risk X: Avoid combination*

Eletriptan: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Eletriptan. *Risk D: Consider therapy modification*

Eletriptan: Fluconazole may decrease the metabolism of Eletriptan. *Risk C: Monitor therapy*

Eplerenone: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Eplerenone. *Risk D: Consider therapy modification*

Eplerenone: Fluconazole may decrease the metabolism of Eplerenone. *Risk C: Monitor therapy*

Erlotinib: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Erlotinib. *Risk C: Monitor therapy*

Eszopiclone: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Eszopiclone. *Risk C: Monitor therapy*

FentaNYL: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Fosaprepitant: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Fosaprepitant. Specifically, concentrations of aprepitant are likely to be increased. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Gefitinib: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Gefitinib. *Risk C: Monitor therapy*

Grapefruit Juice: May increase the metabolism of Antifungal Agents (Azole Derivatives, Systemic). This specifically applies to oral antifungal administration. *Risk D: Consider therapy modification*

H2-Antagonists: May decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). *Risk D: Consider therapy modification*

HMG-CoA Reductase Inhibitors: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of HMG-CoA Reductase Inhibitors. **Exceptions:** Fluvastatin; Rosuvastatin. *Risk D: Consider therapy modification*

HMG-CoA Reductase Inhibitors: Fluconazole may decrease the metabolism of HMG-CoA Reductase Inhibitors. **Exceptions:** Pravastatin; Rosuvastatin. *Risk D: Consider therapy modification*

Imatinib: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Imatinib. *Risk C: Monitor therapy*

Irbesartan: Fluconazole may decrease the metabolism of Irbesartan. *Risk C: Monitor therapy*

Irinotecan: Antifungal Agents (Azole Derivatives, Systemic) may enhance the adverse/toxic effect of Irinotecan. *Risk D: Consider therapy modification*

Losartan: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Losartan. *Risk C: Monitor therapy*

Losartan: Fluconazole may decrease the metabolism of Losartan. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Antifungal Agents (Azole Derivatives, Systemic). Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Macrolide Antibiotics. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Methadone: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Methadone. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

Phenytoin: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Phenytoin. Phenytoin may decrease the serum concentration of Antifungal Agents (Azole Derivatives, Systemic). *Risk D: Consider therapy modification*

Phenytoin: Fluconazole may decrease the metabolism of Phenytoin. *Risk D: Consider therapy modification*

Phosphodiesterase 5 Inhibitors: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Phosphodiesterase 5 Inhibitors. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Pimozide: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Pimozide. *Risk X: Avoid combination*

Protease Inhibitors: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Protease Inhibitors. Protease Inhibitors may increase the serum concentration of Antifungal Agents (Azole Derivatives, Systemic). Management: Limit indinavir to 600mg every 8 hours with itraconazole or ketoconazole. When used with ritonavir, limit ketoconazole to 200mg/day. Tipranavir labeling recommends limiting fluconazole, itraconazole, and ketoconazole to 200mg with tipranavir/ritonavir. *Risk D: Consider therapy modification*

Proton Pump Inhibitors: May decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). *Risk D: Consider therapy modification*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

QuiNIDine: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of QuiNIDine. Management: Itraconazole, voriconazole, and posaconazole are specifically contraindicated with quinidine. Use of quinidine with any azole antifungal may require quinidine dose adjustment and should be done with caution and close monitoring. *Risk X: Avoid combination*

QuiNIDine: Fluconazole may decrease the metabolism of QuiNIDine. *Risk C: Monitor therapy*

Ramelteon: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Ramelteon. *Risk C: Monitor therapy*

Ramelteon: Fluconazole may decrease the metabolism of Ramelteon. *Risk C: Monitor therapy*

Ranolazine: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Ranolazine. *Risk X: Avoid combination*

Repaglinide: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Repaglinide. Management: Concurrent use of an azole antifungal with both repaglinide and gemfibrozil should be avoided. *Risk C: Monitor therapy*

Rifamycin Derivatives: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Rifamycin Derivatives. Only rifabutin appears to be affected. Rifamycin Derivatives may decrease the serum concentration of Antifungal Agents (Azole Derivatives, Systemic). *Risk D: Consider therapy modification*

Rifamycin Derivatives: Fluconazole may decrease the metabolism of Rifamycin Derivatives. This appears only affect rifabutin. Rifamycin Derivatives may increase the metabolism of Fluconazole. *Risk C: Monitor therapy*

Saccharomyces boulardii: Antifungal Agents may diminish the therapeutic effect of Saccharomyces boulardii. *Risk D: Consider therapy modification*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Sirolimus: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Sirolimus. Management: Sirolimus dose reductions of up to 50-90% may be necessary when starting an azole antifungal. Use of sirolimus with the azole antifungals voriconazole and posaconazole is contraindicated. *Risk D: Consider therapy modification*

Solifenacin: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Solifenacin. *Risk D: Consider therapy modification*

Sucralfate: May decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). *Risk C: Monitor therapy*

Sulfonylureas: Fluconazole may increase the serum concentration of Sulfonylureas. *Risk C: Monitor therapy*

Sunitinib: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Sunitinib. *Risk D: Consider therapy modification*

Tacrolimus: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Tacrolimus. *Risk D: Consider therapy modification*

Tacrolimus: Fluconazole may decrease the metabolism of Tacrolimus. *Risk D: Consider therapy modification*

Temsirolimus: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Temsirolimus. Concentrations of the active metabolite, sirolimus, are likely to be increased more substantially than those of the parent temsirolimus. *Risk D: Consider therapy*

modification

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Tolterodine: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Tolterodine. This is likely only of concern in CYP2D6-deficient patients (ie, "poor metabolizers") *Risk D: Consider therapy modification*

Tolterodine: Fluconazole may decrease the metabolism of Tolterodine. This is likely only of concern in CYP2D6-deficient patients (ie, "poor metabolizers") *Risk C: Monitor therapy*

VinCRIStine: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of VinCRIStine. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Fluconazole may decrease the metabolism of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Zidovudine: Fluconazole may decrease the metabolism of Zidovudine. *Risk C: Monitor therapy*

Ziprasidone: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Ziprasidone. *Risk C: Monitor therapy*

Zolpidem: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Zolpidem. *Risk D: Consider therapy modification*

Monitoring ParametersPeriodic liver function tests (AST, ALT, alkaline phosphatase) and renal function tests, potassium

Nursing: Physical Assessment/MonitoringAssess results of cultures/sensitivity and patient's allergy history prior to beginning therapy. Assess potential for interactions with other pharmacological agents patient may be taking (eg, potential for toxicities). See Administration specifics for I.V. use. Assess results of laboratory tests (renal and hepatic function), therapeutic effectiveness (resolution of fungal infection), and adverse response (eg, hepatotoxicity [jaundice], skin disorders, abdominal pain) on a regular basis throughout therapy. Teach patient use (full course of therapy may require weeks or months after symptoms resolve), possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsCulture prior to beginning therapy, periodic liver function (AST, ALT, alkaline phosphatase) and renal function, potassium

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take as directed, around-the-clock. Take full course of medication as ordered. Take with or without food. Follow good hygiene measures to prevent reinfection. Frequent blood tests may be required. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause headache, dizziness, drowsiness (use caution when driving or engaging in tasks that require alertness until response to drug is known); or nausea, vomiting, or diarrhea (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Report skin rash, redness, or irritation; persistent GI upset; urinary pattern changes; excessively dry eyes or mouth; or changes in color of stool or urine. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Infusion [premixed in sodium chloride or dextrose]: 200 mg (100 mL); 400 mg (200 mL)

Diflucan® [premixed in sodium chloride or dextrose]: 200 mg (100 mL); 400 mg (200 mL)

Powder for oral suspension: 10 mg/mL (35 mL); 40 mg/mL (35 mL)

Diflucan®: 10 mg/mL (35 mL); 40 mg/mL (35 mL) [contains sodium benzoate; orange flavor]

Tablet: 50 mg, 100 mg, 150 mg, 200 mg

Diflucan®: 50 mg, 100 mg, 150 mg, 200 mg

Generic AvailableYes

ManufacturerPfizer U.S. Pharmaceuticals Group

Pricing: U.S. (www.drugstore.com)

Suspension (reconstituted) (Diflucan)

10 mg/mL (35): $45.53

40 mg/mL (35): $157.16

Suspension (reconstituted) (Fluconazole)

10 mg/mL (35): $25.99

40 mg/mL (35): $109.98

Tablets (Diflucan)

50 mg (15): $109.99

100 mg (15): $171.86

150 mg (1): $25.99

200 mg (4): $76.37

Tablets (Fluconazole)

100 mg (15): $54.99

150 mg (12): $167.19

200 mg (4): $39.77

Mechanism of ActionInterferes with fungal cytochrome P450 activity (lanosterol 14-α-demethylase), decreasing ergosterol synthesis (principal sterol in fungal cell membrane) and inhibiting cell membrane formation

Pharmacodynamics/Kinetics

Distribution: Widely throughout body with good penetration into CSF, eye, peritoneal fluid, sputum, skin, and urine

Relative diffusion blood into CSF: Adequate with or without inflammation (exceeds usual MICs)

CSF:blood level ratio: Normal meninges: 70% to 80%; Inflamed meninges: >70% to 80%

Protein binding, plasma: 11% to 12%

Bioavailability: Oral: >90%

Half-life elimination: Normal renal function: ~30 hours

Time to peak, serum: Oral: 1-2 hours

Excretion: Urine (80% as unchanged drug)

Related Information

- Antifungal Agents
- Treatment of Sexually-Transmitted Infections
- USPHS / IDSA Guidelines for the Prevention of Opportunistic Infections in Persons Infected With HIV

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Abnormal taste.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness and seizures

Mental Health: Effects on Psychiatric TreatmentNone reported; CYP3A4 inhibitor; use caution with triazolam, alprazolam, and midazolam

Cardiovascular ConsiderationsFluconazole is contraindicated in patients taking cisapride due to increased risk for significant cardiotoxicity, particularly proarrhythmia.

Anesthesia and Critical Care Concerns/Other ConsiderationsDo not use if cloudy or precipitated. If administered by I.V. infusion, give over 1-2 hours.

Flucytosine

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Flucytosine may be confused with fluorouracil

Ancobon® may be confused with Oncovin®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(floo SYE toe seen)

U.S. Brand NamesAncobon®

Canadian Brand NamesAncobon®

Pharmacologic CategoryAntifungal Agent, Oral

Use: Labeled IndicationsAdjunctive treatment of systemic fungal infections (eg, septicemia, endocarditis, UTI, meningitis, or pulmonary) caused by susceptible strains of *Candida* or *Cryptococcus*

Dosing: Adults

Endocarditis: Oral: 25-37.5 mg/kg every 6 hours (with amphotericin B) for at least 6 weeks after valve replacement

Meningoencephalitis, cryptococcal: Induction: Oral: 25 mg/kg/dose (with amphotericin B) every 6 hours for 2 weeks; if clinical improvement, may discontinue both amphotericin and flucytosine and follow with an extended course of fluconazole (400 mg/day); alternatively, may continue flucytosine for 6-10 weeks (with amphotericin B) without conversion to fluconazole treatment

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricUnlabeled use. Refer to adult dosing.

Dosing: Renal ImpairmentUse lower initial dose:

Cl_{cr} 20-40 mL/minute: Administer 37.5 mg/kg every 12 hours

Cl_{cr} 10-20 mL/minute: Administer 37.5 mg/kg every 24 hours

Cl_{cr} <10 mL/minute: Administer 37.5 mg/kg every 24-48 hours, but monitor drug concentrations frequently

Hemodialysis: Dialyzable (50% to 100%); administer dose posthemodialysis

Peritoneal dialysis: Adults: Administer 0.5-1 g every 24 hours

Continuous arteriovenous or venovenous hemodiafiltration effects: Change dosing frequency to every 12-24 hours (monitor serum concentrations and adjust)

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralAdminister around-the-clock to promote less variation in peak and trough serum levels. To avoid nausea and vomiting, administer a few capsules at a time over 15 minutes until full dose is taken.

StorageStore at room temperature of 15°C to 30°C (59°F to 86°F). Protect from light.

Extemporaneously PreparedFlucytosine oral liquid has been prepared by using the contents of ten 500 mg capsules triturated in a mortar and pestle with a small amount of distilled water; the mixture was transferred to a 500 mL volumetric flask; the mortar was rinsed several times with a small amount of distilled water and the fluid added to the flask; sufficient distilled water was added to make a total volume of 500 mL of a 10 mg/mL liquid; oral liquid was stable for 70 days when stored in glass or plastic prescription bottles at 4°C or for up to 14 days at room temperature.

Wintermeyer SM and Nahata MC, “Stability of Flucytosine in an Extemporaneously Compounded Oral Liquid,” *Am J Health Syst Pharm*, 1996, 53:407-9.

ContraindicationsHypersensitivity to flucytosine or any component of the formulation

Warnings/Precautions

Boxed warnings:

- Monitoring: See “Other warnings/precautions” below.

- Renal impairment: See “Disease-related concerns” below.

Disease-related concerns:

- Hematologic disease: Use with caution in patients with bone marrow depression, hematologic disease or who have been treated with radiation or drugs that suppress the bone marrow; bone marrow toxicity can be irreversible.

- Hepatic impairment: Use with caution in patients with hepatic impairment; hepatotoxicity may occur.

- Renal impairment: **[U.S. Boxed Warning]: Use with extreme caution in patients with renal dysfunction;** dosage adjustment required.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Monitoring: **[U.S. Boxed Warning]: Closely monitor hematologic, renal, and hepatic status.** Hepatotoxicity and bone marrow toxicity appear to be dose related; monitor levels closely and adjust dose accordingly.

- Monotherapy: Avoid use as monotherapy; resistance rapidly develops.

Geriatric ConsiderationsAdjust for renal function.
Pregnancy Risk FactorC
Pregnancy ConsiderationsTeratogenic in some animal studies, however, there are no adequate and well-controlled studies in pregnant women.
LactationExcretion in breast milk unknown/not recommended
Adverse ReactionsFrequency not defined.

Cardiovascular: Cardiac arrest, myocardial toxicity, ventricular dysfunction, chest pain

Central nervous system: Ataxia, confusion, dizziness, drowsiness, fatigue, hallucinations, headache, parkinsonism, psychosis, pyrexia, sedation, seizure, vertigo

Dermatologic: Rash, photosensitivity, pruritus, toxic epidermal necrolysis, urticaria

Endocrine & metabolic: Hypoglycemia, hypokalemia

Gastrointestinal: Abdominal pain, diarrhea, dry mouth, duodenal ulcer, hemorrhage, loss of appetite, nausea, ulcerative colitis, vomiting

Hematologic: Agranulocytosis, anemia, aplastic anemia, eosinophilia, leukopenia, pancytopenia, thrombocytopenia

Hepatic: Acute hepatic injury, bilirubin increased, hepatic dysfunction, jaundice, liver enzymes increased

Neuromuscular & skeletal: Paresthesia, peripheral neuropathy, weakness

Otic: Hearing loss

Renal: Azotemia, BUN increased, crystalluria, renal failure, serum creatinine increased

Respiratory: Dyspnea, respiratory arrest

Miscellaneous: Allergic reaction

Oncology: Emetic PotentialVery low (<10%)
Drug Interactions

Cytarabine: May diminish the therapeutic effect of Flucytosine. *Risk D: Consider therapy modification*

Saccharomyces boulardii: Antifungal Agents may diminish the therapeutic effect of Saccharomyces boulardii. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsFood: Food decreases the rate, but not the extent of absorption.
Test InteractionsFlucytosine causes markedly false elevations in serum creatinine values when the Ektachem® analyzer is used. The Jaffé reaction is recommended for determining serum creatinine.
Monitoring Parameters

Pretreatment: Electrolytes (especially potassium), CBC with differential, BUN, renal function, blood culture

During treatment: CBC with differential, and LFTs (eg, alkaline phosphatase, AST/ALT) frequently, serum flucytosine concentration, renal function

Reference Range

Therapeutic: Trough: 25–50 mcg/mL; peak: 50–100 mcg/mL; peak levels should not exceed 100 mcg/mL to avoid toxic bone marrow depressive and hepatic effects

Trough: Draw just prior to dose administration

Peak: Draw 2 hours after an oral dose administration

Nursing: Physical Assessment/MonitoringSee Warnings/Precautions for use cautions (eg, renal dysfunction, bone marrow depression, hematologic disease). Assess potential for interactions with other pharmacological agents patient may be taking (see Drug Interactions). Assess results of laboratory tests prior to and during treatment. Hematologic, renal, and hepatic status must be closely monitored; dose adjustments may be necessary. Assess therapeutic effectiveness (resolution of fungal infection) and adverse response (eg, cardiac incidents, CNS changes, bone marrow suppression, jaundice, skin reactions, hearing loss) on a regular basis throughout therapy. Teach patient use (full course of therapy may require some time after symptoms resolve), possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab Tests

Pretreatment: Electrolytes (especially potassium), CBC with differential, BUN, renal function, blood culture

During treatment: CBC with differential, and LFTs (eg, alkaline phosphatase, AST/ALT) frequently, serum flucytosine concentration, renal function

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take capsules one at a time over a few minutes with food to reduce GI upset. Take full course of medication as ordered. Do not discontinue without consulting prescriber. Practice good hygiene measures to prevent reinfection. Frequent blood tests may be required. May cause nausea and vomiting (small, frequent meals may help). Report rash; respiratory difficulty; CNS changes (eg, confusion, hallucinations, ataxia, acute headache); yellowing of skin or eyes; changes in color or frequency of stool or urine; unresolved diarrhea or anorexia; or unusual bleeding, fatigue, or weakness. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 250 mg, 500 mg

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Capsules (Ancobon)

250 mg (100): $1018.66

500 mg (30): $668.84

Mechanism of ActionPenetrates fungal cells and is converted to fluorouracil which competes with uracil interfering with fungal RNA and protein synthesis

Pharmacodynamics/Kinetics

Absorption: 76% to 89%

Distribution: Into CSF, aqueous humor, joints, peritoneal fluid, and bronchial secretions; V_d: 0.6 L/kg

Protein binding: 3% to 4%

Metabolism: Minimally hepatic; deaminated, possibly via gut bacteria, to 5-fluorouracil

Half-life elimination:

Normal renal function: 2-5 hours

Anuria: 85 hours (range: 30-250)

End stage renal disease: 75-200 hours

Time to peak, serum: ~1-2 hours

Excretion: Urine (>90% as unchanged drug)

Related Information

- Antifungal Agents

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay rarely cause drowsiness, confusion, or hallucinations

Mental Health: Effects on Psychiatric TreatmentMay cause bone marrow suppression; use caution with clozapine and carbamazepine

Index Terms5-FC; 5-Fluorocytosine; 5-Flurocytosine

Regimen UseLeukemia, chronic lymphocytic

Index TermsCyclophosphamide-Fludarabine; FC

RegimenNOTE: Multiple variations are listed below.

Variation 1:

Fludarabine: I.V.: 25 mg/m^2/day days 1, 2, and 3

[total dose/cycle = 75 mg/m^2]

Cyclophosphamide: I.V.: 250 mg/m^2/day days 1, 2, and 3

[total dose/cycle = 750 mg/m^2]

Repeat cycle every 4 weeks for up to 6 cycles

Variation 2:

Fludarabine: I.V.: 30 mg/m^2/day days 1, 2, and 3

[total dose/cycle = 90 mg/m^2]

Cyclophosphamide: I.V.: 250 mg/m^2/day days 1, 2, and 3

[total dose/cycle = 750 mg/m^2]

Repeat cycle every 4 weeks for up to 6 cycles

Variation 3:

Cyclophosphamide: I.V.: 600 mg/m^2 day 1 only

[total dose/cycle = 600 mg/m^2]

Fludarabine: I.V.: 20 mg/m^2/day days 1 to 5

[total dose/cycle = 100 mg/m^2]

Repeat cycle every 4 weeks for up to 6 cycles

Variation 4:

Fludarabine: I.V.: 30 mg/m^2/day days 1, 2, and 3

[total dose/cycle = 90 mg/m^2]

Cyclophosphamide: I.V.: 300 mg/m^2/day days 1, 2, and 3

[total dose/cycle = 900 mg/m^2]

Repeat cycle every 4 weeks for up to 6 cycles

Variation 5:

Fludarabine: I.V.: 30 mg/m^2/day days 1, 2, and 3

[total dose/cycle = 90 mg/m^2]

Cyclophosphamide: I.V.: 300 mg/m^2/day days 1, 2, and 3

[total dose/cycle = 900 mg/m^2]

Repeat cycle every 4-6 weeks for up to 6 cycles

RegimenNOTE: Multiple variations are listed below.

Consider pretherapy cytoreduction with cyclophosphamide 200 mg/m^2/day for 3-5 days for patients with high tumor burden and/or lymphocytes >20,000/mm^3

Variation 1:

Rituximab: I.V.: 375 mg/m^2/dose day 1

[total dose/cycle = 375 mg/m^2]

Fludarabine: I.V.: 25 mg/m^2/day days 2, 3, and 4

[total dose/cycle = 75 mg/m^2]

Cyclophosphamide: I.V.: 200 mg/m^2/day days 2, 3, and 4

[total dose/cycle = 600 mg/m^2]

Mitoxantrone: I.V.: 8 mg/m^2/dose day 2

[total dose/cycle = 8 mg/m^2]

Repeat cycle every 28 days for total of 4 cycles

Variation 2 (with maintenance rituximab):

Rituximab: I.V.: 375 mg/m^2/dose day 1

[total dose/cycle = 375 mg/m^2]

Fludarabine: I.V.: 25 mg/m^2/day days 2, 3, and 4

[total dose/cycle = 75 mg/m^2]

Cyclophosphamide: I.V.: 200 mg/m^2/day days 2, 3, and 4

[total dose/cycle = 600 mg/m^2]

Mitoxantrone: I.V.: 8 mg/m^2/dose day 2

[total dose/cycle = 8 mg/m^2]

Repeat cycle every 28 days for total of 4 cycles

followed by:

Maintenance rituximab (begin 3 months after completion of cycle 4):

Rituximab: I.V.: 375 mg/m^2/dose day 1, 8, 15, and 22

[total dose/cycle = 1500 mg/m^2]

Repeat maintenance cycle (once) in 6 months

Index TermsFNDR (NHL); Rituximab-Fludarabine-Mitoxantrone-Dexamethasone
Regimen

Cycle 1:

Rituximab: I.V.: 375 mg/m^2/day days 1 and 8

[total dose/cycle = 750 mg/m^2]

Fludarabine: I.V.: 25 mg/m^2/day days 1, 2, and 3

[total dose/cycle = 75 mg/m^2]

Mitoxantrone: I.V.: 10 mg/m^2/dose day 1

[total dose/cycle = 10 mg/m^2]

Dexamethasone: I.V. or Oral: 20 mg/m^2/day days 1 to 5

[total dose/cycle = 100 mg/m^2]

Treatment cycle is 28 days

Cycles 2-5:

Rituximab: I.V.: 375 mg/m^2 day 1

[total dose/cycle = 375 mg/m^2]

Fludarabine: I.V.: 25 mg/m^2/day days 2, 3, and 4

[total dose/cycle = 75 mg/m^2]

Mitoxantrone: I.V.: 10 mg/m^2/dose day 2

[total dose/cycle = 10 mg/m^2]

Dexamethasone: I.V. or Oral: 20 mg/m^2/day days 1 to 5

[total dose/cycle = 100 mg/m^2]

Repeat cycle every 28 days

Cycles 6-8:

Fludarabine: I.V.: 25 mg/m^2/day days 1, 2, and 3

[total dose/cycle = 75 mg/m^2]

Mitoxantrone: I.V.: 10 mg/m^2/dose day 1

[total dose/cycle = 10 mg/m^2]

Dexamethasone: I.V. or Oral: 20 mg/m^2/day days 1 to 5

[total dose/cycle = 100 mg/m^2]

Repeat cycle every 28 days

followed by:

Interferon maintenance:

Interferon alfa-2b: SubQ: 3 million units/m^2 days 1 to 14

[total dose/cycle = 42 million units/m^2]

Dexamethasone: Oral: 8 mg/day days 1, 2, and 3

[total dose/cycle = 24 mg]

Repeat cycle every month for 1 year

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Fludarabine may be confused with floxuridine, Flumadine®

Fludara® may be confused with FUDR®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(floo DARE a been)

U.S. Brand NamesFludara®

Canadian Brand NamesBeneflur®; Fludara®

Pharmacologic CategoryAntineoplastic Agent, Antimetabolite (Purine Antagonist)

Use: Labeled Indications

U.S. labeling: I.V.: Treatment of chronic lymphocytic leukemia (CLL) (including refractory CLL)

Canadian labeling:

I.V.: Treatment of chronic lymphocytic leukemia (CLL) (including refractory CLL); treatment of low-grade, refractory non-Hodgkin’s lymphoma (NHL)

Oral (formulation not available in U.S.): Treatment of CLL

Use: Unlabeled/InvestigationalTreatment of non-Hodgkin's lymphoma (NHL); refractory acute leukemias and solid tumors (in pediatric patients); Waldenström's macroglobulinemia (WM); reduced-intensity conditioning regimens prior to allogeneic hematopoietic stem cell transplantation (generally administered in combination with busulfan and antithymocyte globulin or lymphocyte immune globulin, or in combination with melphalan and alemtuzumab)

Dosing: Adults

Chronic lymphocytic leukemia (CLL):

I.V.: 25 mg/m^2/day for 5 days every 28 days

Oral: **Note:** Formulation available in Canada; not available in U.S.: 40 mg/m^2 once daily for 5 days every 28 days

Non-Hodgkin's lymphoma, WM (unlabeled uses): I.V.: 25 mg/m^2 for 5 days every 28 days

Reduced-intensity conditioning regimens prior to allogeneic hematopoietic stem cell transplantation (unlabeled use): I.V.: 120-150 mg/m^2 administered in divided doses over 4-5 days

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Refractory acute leukemia (unlabeled use): I.V.: 10 mg/m^2 bolus over 15 minutes followed by continuous infusion of 30.5 mg/m^2/day for 5 days **or**

10.5 mg/m^2 bolus over 15 minutes followed by 30.5 mg/m^2/day for 48 hours

Refractory solid tumors (unlabeled use): I.V.: 7 mg/m^2 bolus followed by 20 mg/m^2/day continuous infusion for 5 days

Dosing: Renal Impairment

FDA-approved labeling contains the following adjustment recommendations:

Cl_{cr} 30-70 mL/minute: Administer 80% of dose.

Cl_{cr} <30 mL/minute: Avoid use.

Canadian labeling contains the following adjustment recommendations:

Cl_{cr} 30-70 mL/minute: Administer 50% of dose.

Cl_{cr} <30 mL/minute: Use is contraindicated.

The following guidelines have been used by some clinicians:

Aronoff, 2007:

Children:

Cl_{cr} 30-50 mL/minute: Administer 80% of dose.

Cl_{cr} <30 mL/minute: Not recommended.

Hemodialysis: Administer 25% of dose

Continuous ambulatory peritoneal dialysis (CAPD): Not recommended.

Continuous renal replacement therapy (CRRT): Administer 80% of dose.

Adults:

Cl_{cr} 10-50 mL/minute: Administer 75% of dose.

Cl_{cr} <10 mL/minute: Administer 50% of dose.

Hemodialysis: Administer after dialysis

Continuous ambulatory peritoneal dialysis (CAPD): Administer 50% of dose.

Continuous renal replacement therapy (CRRT): Administer 75% of dose.

Kintzel, 1995:

Cl_{cr} 46-60 mL/minute: Administer 80% of dose.

Cl_{cr} 31-45 mL/minute: Administer 75% of dose.

Cl_{cr} <30 mL/minute: Administer 65% of dose.

Dosing: Combination Regimens

Leukemia, acute lymphocytic: FIS-HAM

Leukemia, acute myeloid:

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics
- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.Administer I.V. over 30 minutes or continuous infusion.

Administration: I.V. DetailpH: 7.2-8.2

Administration: OralTablet (formulation not available in U.S.) may be administered with or without food; should be swallowed whole; do not chew, break, or crush.

Storage

I.V.: Store intact vials under refrigeration at 2°C to 8°C (36°F to 46°F). Reconstituted vials are stable for 16 days at room temperature of 15°C to 30°C (59°F to 86°F) or refrigerated, although the manufacturer recommends use within 8 hours. Solutions diluted in saline or dextrose are stable for 48 hours at room temperature or under refrigeration.

Tablet (formulation not available in U.S.): Store between 15°C to 30°C (59°F to 86°F); should be kept within packaging until use.

ReconstitutionReconstitute vials with SWI, NS, or D_5W to a concentration of 10-25 mg/mL. Standard I.V. dilution: 100-125 mL D_5W or NS.

CompatibilityStable in D_5W, NS, sterile water for injection.

Y-site administration: Compatible: Allopurinol, amifostine, amikacin, aminophylline, ampicillin, ampicillin/sulbactam, amsacrine, aztreonam, bleomycin, butorphanol, carboplatin, carmustine, cefazolin, cefepime, cefoperazone, cefotaxime, cefotetan, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, cimetidine, cisplatin, clindamycin, co-trimoxazole, cyclophosphamide, cytarabine, dacarbazine, dactinomycin, dexamethasone sodium phosphate, diphenhydramine, doxorubicin, doxycycline, droperidol, etoposide, etoposide phosphate, famotidine, filgrastim, floxuridine, fluconazole, fluorouracil, furosemide, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hydrocortisone sodium phosphate, hydrocortisone sodium succinate, hydromorphone, ifosfamide, imipenem/cilastatin, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, mesna, methotrexate, methylprednisolone sodium succinate, metoclopramide, minocycline, mitoxantrone, morphine, multivitamins, nalbuphine, netilmicin, ondansetron, pentostatin, piperacillin, piperacillin/tazobactam, potassium chloride, promethazine, ranitidine, sodium bicarbonate, teniposide, thiotepa, ticarcillin, ticarcillin/clavulanate, tobramycin, vancomycin, vinblastine, vincristine, vinorelbine, zidovudine. **Incompatible:** Acyclovir, amphotericin B, chlorpromazine, daunorubicin, ganciclovir, hydroxyzine, prochlorperazine edisylate.

Contraindications

Hypersensitivity of fludarabine or any component of the formulation

Canadian labeling: Additional contraindications (not in U.S. labeling): Severe renal impairment (Cl_{cr} <30 mL/minute); decompensated hemolytic anemia; pregnancy; women who are breast-feeding; concurrent use with pentostatin

Warnings/Precautions

Boxed warnings:

- Autoimmune effects: See “Concerns related to adverse effects” below.
- Bone marrow suppression: See “Concerns related to adverse effects” below.
- Experienced physician: See “Concerns related to adverse effects” below.
- Neurologic toxicity: See “Concerns related to adverse effects” below.
- Pentostatin: See “Concurrent drug therapy issues” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Autoimmune effects: **[U.S. Boxed Warning]: Life-threatening (and sometimes fatal) autoimmune effects, including hemolytic anemia, autoimmune thrombocytopenia/thrombocytopenic purpura (ITP), Evans syndrome, and acquired hemophilia have occurred;** monitor closely for hemolysis. The hemolytic effects usually recur with fludarabine rechallenge.
- Bone marrow suppression: **[U.S. Boxed Warning]: Severe bone marrow suppression (anemia, thrombocytopenia, and neutropenia) may occur;** severe myelosuppression (trilineage bone marrow hypoplasia/aplasia) has been reported (rare); the duration of significant cytopenias in these cases may be prolonged (up to 1 year).
- Neurologic toxicity: **[U.S. Boxed Warning]: Higher than recommended doses (up to 96 mg/m^2/day for 5-7 days) are associated with severe neurologic toxicity (blindness, coma, death);** similar toxicity was reported rarely at recommended doses.
- Progressive multifocal leukoencephalopathy (PML): PML (usually fatal) due to JC virus has been reported with use; most cases were in patients who had received prior and/or other concurrent chemotherapy. Onset may be a few weeks or may be delayed up to 1 year. Evaluate any neurological change promptly.
- Tumor lysis syndrome: May cause tumor lysis syndrome; risk is increased in patients with large tumor burden prior to treatment.

Disease-related concerns:

- CNS disorders: Use with caution in patients with pre-existing central nervous system disorder (epilepsy), spasticity, or peripheral neuropathy.
- Hematologic disorders: Use with caution in patients with pre-existing hematological disorders (particularly granulocytopenia).
- Infection: Use with caution in patients with documented infection or fever. Prophylactic anti-infectives should be considered for patients with an increased risk for developing opportunistic infections.
- Renal impairment: Use with caution in patients with renal impairment; dosage reductions may be recommended; avoid use with Cl_{cr} <30 mL/minute.

Concurrent drug therapy issues:

- Pentostatin: **[U.S. Boxed Warning]: Do not use in combination with pentostatin; may lead to severe, even fatal pulmonary toxicity.** Concomitant use is contraindicated in the Canadian labeling.

Other warnings/precautions:

- Blood products: Patients receiving blood products should only receive irradiated blood products due to the potential for transfusion related GVHD.
- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**
- Live vaccines: Avoid vaccination with live vaccines during and after fludarabine treatment.

Pregnancy Risk Factor

D

Pregnancy ConsiderationsTeratogenic effects were observed in animal studies. Effective contraception is recommended during and for 6 months after treatment for women and men of reproductive potential. The manufacturer recommends pregnant staff should not handle fludarabine.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions in the nursing infant, breast-feeding is not recommended.

Adverse Reactions

>10%:

Cardiovascular: Edema (8% to 19%)

Central nervous system: Fever (60% to 69%), fatigue (10% to 38%), pain (20% to 22%), chills (11% to 19%)

Dermatologic: Rash (15%)

Gastrointestinal: Nausea/vomiting (mild: 31% to 36%), anorexia (7% to 34%), diarrhea (13% to 15%), gastrointestinal bleeding (3% to 13%)

Genitourinary: Urinary tract infection (2% to 15%)

Hematologic: Myelosuppression (nadir: 10-14 days; recovery: 5-7 weeks; dose-limiting toxicity), anemia (60%), neutropenia (grade 4: 59%; nadir: ~13 days), thrombocytopenia (50% to 55%; nadir: ~16 days)

Neuromuscular & skeletal: Weakness (9% to 65%), myalgia (4% to 16%), paresthesia (4% to 12%)

Ocular: Visual disturbance (3% to 15%)

Respiratory: Cough (10% to 44%), pneumonia (16% to 22%), dyspnea (9% to 22%), upper respiratory infection (2% to 16%)

Miscellaneous: Infection (33% to 44%), diaphoresis (1% to 13%)

1% to 10%:

Cardiovascular: Angina (≤6%), CHF (≤3%), arrhythmia (≤3%), cerebrovascular accident (≤3%), MI (≤3%), supraventricular tachycardia (≤3%), deep vein thrombosis (1% to 3%), phlebitis (1% to 3%), aneurysm (≤1%), transient ischemic attack (≤1%)

Central nervous system: Malaise (6% to 8%), headache (≤3%), sleep disorder (1% to 3%), cerebellar syndrome (≤1%), depression (≤1%), mentation impaired (≤1%)

Dermatologic: Alopecia (≤3%), pruritus (1% to 3%), seborrhea (≤1%)

Endocrine & metabolic: Hyperglycemia (1% to 6%), dehydration (≤1%)

Gastrointestinal: Stomatitis (≤9%), esophagitis (≤3%), constipation (1% to 3%), mucositis (≤2%), dysphagia (≤1%)

Genitourinary: Dysuria (3% to 4%), hesitancy (≤3%)

Hematologic: Hemorrhage (≤1%)

Hepatic: Cholelithiasis (≤3%), liver function tests abnormal (1% to 3%), liver failure (≤1%)

Neuromuscular & skeletal: Osteoporosis (≤2%), arthralgia (≤1%)

Otic: Hearing loss (2% to 6%)

Renal: Hematuria (2% to 3%), renal failure (≤1%), renal function test abnormal (≤1%), proteinuria (≤1%)

Respiratory: Pharyngitis (≤9%), allergic pneumonitis (≤6%), hemoptysis (1% to 6%), sinusitis (≤5%), bronchitis (≤1%), epistaxis (≤1%), hypoxia (≤1%)

Miscellaneous: Anaphylaxis (≤1%), tumor lysis syndrome (1%)

<1%, postmarketing, and/or case reports: Agitation, ARDS, blindness, blurred vision, bone marrow fibrosis, coma, confusion, diplopia, eosinophilia, Epstein-Barr virus (EBV) associated lymphoproliferation, EBV reactivation, erythema multiforme, Evans syndrome, flank pain, hemolytic anemia (autoimmune), hemophilia (acquired), hemorrhagic cystitis, herpes zoster reactivation, hyperkalemia, hyperphosphatemia, hyperuricemia, hypocalcemia, interstitial pneumonitis, metabolic acidosis, opportunistic infection, optic neuritis, optic neuropathy, pancytopenia, pemphigus, pericardial effusion, peripheral neuropathy, photophobia (primarily with high doses), progressive multifocal leukoencephalopathy (PML), pulmonary fibrosis, pulmonary hemorrhage, pulmonary infiltrate, respiratory failure, skin cancer (new onset or exacerbation), Stevens-Johnson syndrome, thrombocytopenia (autoimmune), thrombocytopenic purpura (autoimmune), toxic epidermal necrolysis, trilineage bone marrow aplasia, trilineage bone marrow hypoplasia, urate crystalluria, wrist drop

Also observed: Neurologic syndrome characterized by cortical blindness, coma, and paralysis [36% at doses >96 mg/m^2 for 5-7 days; <0.2% at doses <125 mg/m^2/cycle (onset of neurologic symptoms may be delayed for 3-4 weeks)]

Oncology: VesicantNo

Oncology: Emetic PotentialVery low (<10%)

Drug Interactions

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Pentostatin: Fludarabine may enhance the adverse/toxic effect of Pentostatin. Pulmonary toxicity is of specific concern. *Risk D: Consider therapy modification*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (due to GI irritation).

Monitoring ParametersCBC with differential, platelet count, AST, ALT, serum creatinine, serum albumin, uric acid

Nursing: Physical Assessment/MonitoringTo be administered under the supervision of an experienced cancer chemotherapy physician. Use caution in the presence of renal insufficiency, fever, infection, hematological disorders, central nervous system disorders, or peripheral neuropathy. See Administration for infusion specifics. Evaluate results of laboratory tests prior to each treatment and on a regular basis throughout therapy. Assess therapeutic effect and adverse reactions closely, especially CNS, hematological, and neuromuscular effects. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential, platelet count, AST, ALT, serum creatinine, serum albumin, uric acid

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber. This drug is administered by infusion; report any burning, pain, redness, or swelling at infusion site. It is important to maintain adequate hydration (2-3 L/day of fluids unless instructed to restrict fluid intake) and nutrition (small, frequent meals may help). You will be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). May cause fatigue, weakness, visual disturbances (use caution when driving or engaged in potentially hazardous tasks until response to drug in known); nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); loss of hair (reversible); diarrhea (buttermilk, boiled milk, or yogurt may help); or mouth sores (use soft toothbrush or cotton swabs for oral care). Report extreme fatigue; fever; pain or numbness in extremities; severe GI upset or diarrhea; any unusual bleeding or bruising; chills; sore throat; vaginal discharge; difficulty or pain on urination; muscle pain or weakness; unusual cough or respiratory difficulty; changes in vision; or other unusual side effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant while taking this medication or for 1 month following therapy. Consult prescriber for appropriate contraceptives. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Injection, powder for reconstitution, as phosphate: 50 mg

Fludara®: 50 mg [contains mannitol 50 mg/vial]

Tablet, as phosphate:

Fludara® [CAN]: 10 mg [not available in U.S.]

Generic AvailableYes

Mechanism of ActionFludarabine inhibits DNA synthesis by inhibition of DNA polymerase, ribonucleotide reductase and DNA primase.

Pharmacodynamics/Kinetics

Distribution: V_d: 38-96 L/m^2; widely with extensive tissue binding

Protein binding: 19% to 29%

Metabolism: I.V.: Fludarabine phosphate is rapidly dephosphorylated to 2-fluoro-ara-A, which subsequently enters tumor cells and is phosphorylated by deoxycytidine kinase to the active triphosphate derivative; rapidly dephosphorylated in the serum

Bioavailability: 75%

Half-life elimination: 2-fluoro-ara-A: ~20 hours

Excretion: Urine (60%, 23% as 2-fluoro-ara-A) within 24 hours

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Stomatitis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusSedation is common; may cause agitation, confusion, coma

Mental Health: Effects on Psychiatric TreatmentMyelosuppression is common; use caution with clozapine and carbamazepine; concurrent use with low potency antipsychotics and TCAs may produce additive sedation. May cause nausea, vomiting, diarrhea, and GI bleeding; concomitant use with SSRIs may produce additive risk (use caution).

Medication Safety Issues

Sound-alike/look-alike issues:

Florinef® may be confused with Fioricet®, Fiorinal®

Pronunciation(floo droe KOR ti sone)

U.S. Brand NamesFlorinef® [DSC]

Canadian Brand NamesFlorinef®

Pharmacologic CategoryCorticosteroid, Systemic

Use: Labeled IndicationsPartial replacement therapy for primary and secondary adrenocortical insufficiency in Addison's disease; treatment of salt-losing adrenogenital syndrome

Dosing: AdultsMineralocorticoid deficiency: Oral: 0.05-0.2 mg/day with ranges of 0.1 mg 3 times/week to 0.2 mg/day

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricMineralocorticoid deficiency: Oral: Infants and Children: 0.05-0.1 mg/day

Administration: OralAdministration in conjunction with a glucocorticoid is preferable.

Dietary ConsiderationsSystemic use of mineralocorticoids/corticosteroids may require a diet with increased potassium, vitamins A, B_6, C, D, folate, calcium, zinc, and phosphorus, and decreased sodium. With fludrocortisone, a decrease in dietary sodium is often not required as the increased retention of sodium is usually the desired therapeutic effect.

ContraindicationsHypersensitivity to fludrocortisone or any component of the formulation; systemic fungal infections

Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal suppression: May cause hypercorticism or suppression of hypothalamic-pituitary-adrenal (HPA) axis, particularly in younger children or in patients receiving high doses for prolonged periods. HPA axis suppression may lead to adrenal crisis. Withdrawal and discontinuation of a corticosteroid should be done slowly and carefully. Fludrocortisone is primarily a mineralocorticoid agonist, but may also inhibit the HPA axis.

- Immunosuppression: May increase risk of infection and/or limit response to vaccinations; close observation is required in patients with latent tuberculosis and/or TB reactivity. Restrict use in active TB (only in conjunction with antituberculosis treatment).

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with HF; use may be associated with fluid retention, edema, weight gain and hypertension.

- Electrolyte disturbances: Use with caution in patients with sodium retention and potassium loss. Monitor electrolytes periodically; sodium restriction and/or potassium supplementation may be required.

- Hepatic impairment: Use with caution in patients with hepatic impairment, including cirrhosis; long-term use has been associated with fluid retention.

- Myocardial infarction (MI): Use with caution following acute MI; corticosteroids have been associated with myocardial rupture.

- Osteoporosis: Use with caution in patients with osteoporosis; high doses and/or long-term use of corticosteroids have been associated with increased bone loss and osteoporotic fractures.

- Renal impairment: Use with caution in patients with renal impairment; fluid retention may occur.

Special populations:

- Elderly: Because of the risk of adverse effects, systemic corticosteroids should be used cautiously in the elderly in the smallest possible effective dose for the shortest duration.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Discontinuation of therapy: Withdraw therapy with gradual tapering of dose.

Geriatric ConsiderationsThe most common use of fludrocortisone in the elderly is orthostatic hypotension that is unresponsive to more conservative measures. Attempt nonpharmacologic measures (hydration, support stockings etc) before starting drug therapy.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted with fludrocortisone; adverse events have been observed with corticosteroids in animal reproduction studies. Some studies have shown an association between first trimester systemic corticosteroid use and oral clefts; adverse events in the fetus/neonate have been noted in case reports following large doses of systemic corticosteroids during pregnancy.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsCorticosteroids are excreted in human milk; information specific to fludrocortisone has not been located.

Adverse ReactionsFrequency not defined.

Cardiovascular: Hypertension, edema, CHF

Central nervous system: Convulsions, headache, dizziness

Dermatologic: Acne, rash, bruising

Endocrine & metabolic: Hypokalemic alkalosis, suppression of growth, hyperglycemia, HPA suppression

Gastrointestinal: Peptic ulcer

Neuromuscular & skeletal: Muscle weakness

Ocular: Cataracts

Miscellaneous: Diaphoresis, anaphylaxis (generalized)

Drug Interactions

Acetylcholinesterase Inhibitors: Corticosteroids (Systemic) may enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. Increased muscular weakness may occur. *Risk C: Monitor therapy*

Aminoglutethimide: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Amphotericin B: Corticosteroids (Systemic) may enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Antacids: May decrease the bioavailability of Corticosteroids (Oral). *Risk D: Consider therapy modification*

Antidiabetic Agents: Corticosteroids (Systemic) may diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Aprepitant: May increase the serum concentration of Corticosteroids (Systemic). *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Corticosteroids (Oral). *Risk C: Monitor therapy*

Calcitriol: Corticosteroids (Systemic) may diminish the therapeutic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

CycloSPORINE: Corticosteroids (Systemic) may increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Estrogen Derivatives: May increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fosaprepitant: May increase the serum concentration of Corticosteroids (Systemic). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Isoniazid: Corticosteroids (Systemic) may decrease the serum concentration of Isoniazid. *Risk C: Monitor therapy*

Loop Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Corticosteroids (Systemic). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Neuromuscular-Blocking Agents (Nondepolarizing): May enhance the adverse neuromuscular effect of Corticosteroids (Systemic). Increased muscle weakness, possibly progressing to polyneuropathies and myopathies, may occur. *Risk D: Consider therapy modification*

NSAID (COX-2 Inhibitor): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (COX-2 Inhibitor). *Risk C: Monitor therapy*

NSAID (Nonselective): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Primidone: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Quinolone Antibiotics: May enhance the adverse/toxic effect of Corticosteroids (Systemic). Risk of tendon-related side effects, including tendonitis and rupture, may be enhanced. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Salicylates: May enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

Thiazide Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Warfarin: Corticosteroids (Systemic) may enhance the anticoagulant effect of Warfarin. *Risk C: Monitor therapy*

Monitoring ParametersMonitor blood pressure and signs of edema when patient is on chronic therapy; very potent mineralocorticoid with high glucocorticoid activity; monitor serum electrolytes, serum renin activity, and blood pressure; monitor for evidence of infection; stop treatment if a significant increase in weight or blood pressure, edema, or cardiac enlargement occurs

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor for effectiveness of therapy and adverse reactions according to dose and length of therapy. Assess knowledge/teach patient appropriate use, possible side effects/interventions, and adverse symptoms to report (eg, opportunistic infection, adrenal suppression). Instruct patients with diabetes to monitor serum glucose levels closely; corticosteroids can alter glycemic response. Dose may need to be increased if patient is experiencing higher than normal levels of stress. When discontinuing, taper dose and frequency slowly.

Monitoring: Lab TestsSerum electrolytes, serum renin activity

Patient EducationTake exactly as directed. Do not take more than prescribed dose and do not discontinue abruptly; consult prescriber. Take with or after meals. Take once-a-day dose with food in the morning. Limit intake of caffeine or stimulants. Maintain adequate nutrition; consult prescriber for possibility of special dietary recommendations. If you have diabetes, monitor serum glucose closely and notify prescriber of changes; this medication can alter glycemic response. Notify prescriber if you are experiencing higher than normal levels of stress; medication may need adjustment. Periodic ophthalmic examinations will be necessary with long-term use. You will be susceptible to infection (avoid crowds and exposure to infection). You may experience insomnia or nervousness; use caution when driving or engaging in tasks requiring alertness until response to drug is known. Report weakness, change in menstrual pattern, vision changes, signs of hyperglycemia, signs of infection (eg, fever, chills, mouth sores, perianal itching, vaginal discharge), other persistent side effects, or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Tablet, as acetate: 0.1 mg

Florinef®: 0.1 mg [DSC]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Fludrocortisone Acetate)

0.1 mg (30): $25.99

Mechanism of ActionPromotes increased reabsorption of sodium and loss of potassium from renal distal tubules

Pharmacodynamics/Kinetics

Absorption: Rapid and complete

Protein binding: 42%

Metabolism: Hepatic

Half-life elimination, plasma: 30-35 minutes; Biological: 18-36 hours

Time to peak, serum: ~1.7 hours

Related Information

- Corticosteroids

Pharmacotherapy PearlsIn patients with salt-losing forms of congenital adrenogenital syndrome, use along with cortisone or hydrocortisone. Fludrocortisone 0.1 mg has sodium retention activity equal to DOCA® 1 mg.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentBarbiturates and carbamazepine may decrease corticosteroid effects; useful in the management of psychotropic-induced hypotension

Cardiovascular ConsiderationsLong-term steroid therapy is associated with fluid retention and hypertension. This agent has some mineralocorticoid activity with consequent hemodynamic effects. Fludrocortisone has been used to treat severe orthostatic hypotension. Patients will often have steroid-induced adverse effects on glucose tolerance and lipid profiles. In discontinuing steroid therapy in patients on long-term steroid supplementation, it is important that steroid therapy be discontinued gradually. Abrupt withdrawal may result in adrenal insufficiency with hypotension and hyperkalemia.

Anesthesia and Critical Care Concerns/Other ConsiderationsIn patients with salt-losing forms of congenital adrenogenital syndrome, use along with cortisone or hydrocortisone. Fludrocortisone 0.1 mg has sodium retention activity equal to DOCA® 1 mg.

Adrenal Insufficiency: Patients on long-term steroid supplementation will require higher corticosteroid doses when subject to stress (ie, trauma, surgery, severe infection). This agent has significant mineralocorticoid activity with consequent hemodynamic effects. Fludrocortisone has been used to treat severe orthostatic hypotension. Abrupt withdrawal may result in adrenal insufficiency with hypotension and hyperkalemia. A recent randomized, double-blind, placebo controlled trial assessed whether low dose corticosteroid administration could improve 28-day survival in patients with septic shock and acquired adrenal insufficiency. A lack of adrenal reserves is defined by an increase in serum cortisol of ≤9 mcg/dL in response to corticotropin administration. Cortisol levels were drawn immediately before corticotropin administration and 30 to 60 minutes afterwards. Three hundred adult septic shock patients requiring mechanical ventilation and vasopressor support were randomized to either hydrocortisone (50 mg IVP every 6 hours) and fludrocortisone (50 mcg tablet daily via nasogastric tube) or matching placebos for 7 days. Patients included had severe sepsis requiring vasopressor support and mechanical ventilation. In patients who did not appropriately respond to corticotropin (nonresponders), there were significantly fewer deaths in the active treatment group. Vasopressor therapy was withdrawn more frequently in this subset of the active treatment group. Adverse events were similar in both groups. Patients who lack adrenal reserve and thus have acquired adrenal insufficiency during the stress of septic shock may benefit from physiologic steroid replacement. Further study is required to better characterize the patient populations who may benefit.

The 2008 Surviving Sepsis Campaign guidelines recommend doses of corticosteroids comparable to >300 mg hydrocortisone daily **not** be used in severe sepsis or septic shock for the purpose of treating septic shock (Grade 1A). They also recommend corticosteroids **not** be administered for the treatment of sepsis in the absence of shock. There is, however, no contraindication to continuing maintenance steroid therapy or to using stress dose steroids if the patient's endocrine or corticosteroid administration history warrants (Grade 1D).

Index Terms9α-Fluorohydrocortisone Acetate; Fludrocortisone Acetate; Fluohydrisone Acetate; Fluohydrocortisone Acetate

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(FLOO may ze nil)

U.S. Brand NamesRomazicon®

Canadian Brand NamesAnexate®; Flumazenil Injection; Flumazenil Injection, USP; Romazicon®

Pharmacologic CategoryAntidote

Use: Labeled IndicationsBenzodiazepine antagonist; reverses sedative effects of benzodiazepines used in conscious sedation and general anesthesia; treatment of benzodiazepine overdose

Dosing: AdultsSee table.

Flumazenil

Adult dosage for **reversal of conscious sedation and general anesthesia:**	
Initial dose	0.2 mg intravenously over 15 seconds
Repeat doses (maximum: 4 doses)	If desired level of consciousness is not obtained, 0.2 mg may be repeated at 1-minute intervals.
Maximum total cumulative dose	1 mg (usual dose: 0.6-1 mg) **In the event of resedation:** Repeat doses may be given at 20-minute intervals with maximum of 1 mg/dose and 3 mg/hour.
Adult dosage for **suspected benzodiazepine overdose:**	
Initial dose	0.2 mg intravenously over 30 seconds; if the desired level of consciousness is not obtained, 0.3 mg can be given over 30 seconds
Repeat doses	0.5 mg over 30 seconds repeated at 1-minute intervals
Maximum total cumulative dose	3 mg (usual dose: 1-3 mg) Patients with a partial response at 3 mg may require additional titration up to a total dose of 5 mg. If a patient has not responded 5 minutes after cumulative dose of 5 mg, the major cause of sedation is not likely due to benzodiazepines. **In the event of resedation:** May repeat doses at 20-minute intervals with maximum of 1 mg/dose and 3 mg/hour.

Resedation: Repeated doses may be given at 20-minute intervals as needed; repeat treatment doses of 1 mg (at a rate of 0.5 mg/minute) should be given at any time and no more than 3 mg should be given in any hour. After intoxication with high doses of benzodiazepines, the duration of a single dose of flumazenil is not expected to exceed 1 hour; if desired, the period of wakefulness may be prolonged with repeated low intravenous doses of flumazenil, or by an infusion of 0.1-0.4 mg/hour. Most patients with benzodiazepine overdose will respond to a cumulative dose of 1-3 mg and doses >3 mg do not reliably produce additional effects. Rarely, patients with a partial response at 3 mg may require additional titration up to a total dose of 5 mg. **If a patient has not responded 5 minutes after receiving a cumulative dose of 5 mg, the major cause of sedation is not likely to be due to benzodiazepines.**

Dosing: ElderlyRefer to adult dosing. No differences in safety or efficacy have been reported; however, increased sensitivity may occur in some elderly patients.

Dosing: Pediatric

Reversal of benzodiazepine when used in conscious sedation or general anesthesia: I.V.: Initial dose: 0.01 mg/kg (maximum dose: 0.2 mg) given over 15 seconds; may repeat 0.01 mg/kg (maximum dose: 0.2 mg) after 45 seconds, and then every minute (maximum: 4 doses) to a maximum of total cumulative dose of 0.05 mg/kg or 1 mg, whichever is lower; usual total dose: 0.08-1 mg (mean: 0.65 mg).

Dosing: Renal ImpairmentNot significantly affected by renal failure (Cl_{cr} <10 mL/minute) or hemodialysis beginning 1 hour after drug administration.

Dosing: Hepatic ImpairmentUse caution with initial and/or repeat doses in patients with liver disease.

Administration: I.V.Administer in freely-running I.V. into large vein. Inject over 15 seconds for conscious sedation and general anesthesia and over 30 seconds for overdose.

Administration: I.V. DetailpH: 4 (injection)

StorageStore at 15°C to 30°C (59°F to 86°F).

ReconstitutionFor I.V. use only. Once drawn up in the syringe or mixed with solution use within 24 hours. Discard any unused solution after 24 hours.

CompatibilityStable in D_5W, LR, NS.

Compatibility when admixed: Compatible: Aminophylline, cimetidine, dobutamine, dopamine, famotidine, heparin, lidocaine, procainamide, ranitidine.

ContraindicationsHypersensitivity to flumazenil, benzodiazepines, or any component of the formulation; patients given benzodiazepines for control of potentially life-threatening conditions (eg, control of intracranial pressure or status epilepticus); patients who are showing signs of serious cyclic-antidepressant overdosage

Warnings/Precautions

Boxed warnings:

- Seizures: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Amnesia: Does not consistently reverse amnesia; patient may not recall verbal instructions after procedure.
- Resedation: Occurs more frequently in patients where a large single dose or cumulative dose of a benzodiazepine has been administered along with a neuromuscular-blocking agent and multiple anesthetic agents.
- Respiratory depression: Should not rely upon to reverse respiratory depression/hypoventilation. Flumazenil is not a substitute for evaluation of oxygenation. Establishing an airway and assisting ventilation, as necessary, is always the initial step in overdose management.
- Seizures: **[U.S. Boxed Warning]: Benzodiazepine reversal may result in seizures in some patients.** Patients who may develop seizures include patients on benzodiazepines for long-term sedation, tricyclic antidepressant overdose patients, concurrent major sedative-hypnotic drug withdrawal, recent therapy with repeated doses of parenteral benzodiazepines, myoclonic jerking or seizure activity prior to flumazenil administration. Use with caution in patients relying on a benzodiazepine for seizure control.

Disease-related concerns:

- Head injury: Use with caution in patients with a head injury.
- Hepatic impairment: Use with caution in patients with hepatic dysfunction
- Panic disorder: Use with caution in patients with a history of panic disorder; may provoke panic attacks.

Special populations:

- Drug/alcohol dependence: Use caution in drug and ethanol-dependent patients; these patients may also be dependent on benzodiazepines.
- Intensive care patients: Should be used with caution in the intensive care unit because of increased risk of unrecognized benzodiazepine dependence in such settings.
- Pediatrics: Safety and efficacy have not been established in children <1 year of age.

Other warnings/precautions:

- Appropriate use: Should not be used to diagnose benzodiazepine-induced sedation. Reverse neuromuscular blockade before considering use. Flumazenil does not antagonize the CNS effects of other GABA agonists (such as ethanol, barbiturates, or general anesthetics); nor does it reverse narcotics. Not recommended for treatment of benzodiazepine dependence.
- Overdose use: Use with caution in patients with mixed drug overdoses; toxic effects of other drugs taken may emerge once benzodiazepine effects are reversed.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic effects were not seen in animal studies. Embryocidal effects were seen at large doses. There are no adequate or well-controlled studies in pregnant women. Use only if clearly needed.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%: Gastrointestinal: Vomiting, nausea

1% to 10%:

Cardiovascular: Vasodilation (1% to 3%), palpitation

Central nervous system: Headache (1% to 3%), agitation (3% to 9%), dizziness (10%), emotional lability (1% to 3%), fatigue (1% to 3%)

Gastrointestinal: Xerostomia

Local: Pain at injection site (3% to 9%)

Neuromuscular & skeletal: Tremor, weakness, paresthesia (1% to 3%)

Ocular: Abnormal vision, blurred vision (3% to 9%)

Respiratory: Dyspnea, hyperventilation (3% to 9%)

Miscellaneous: Diaphoresis

<1%: Abnormal hearing, altered blood pressure (increases and decreases), confusion, sensation of coldness, bradycardia, chest pain, generalized seizure, hiccups, hypertension, junctional tachycardia, shivering, somnolence, tachycardia, thick tongue, ventricular tachycardia, withdrawal syndrome

Postmarketing and/or case reports: Fear, panic attacks

Drug Interactions

Hypnotics (Nonbenzodiazepine): Flumazenil may diminish the sedative effect of Hypnotics (Nonbenzodiazepine). **Exceptions:** Ramelteon. *Risk C: Monitor therapy*

Monitoring Parameters Monitor patients for return of sedation or respiratory depression

Nursing: Physical Assessment/Monitoring Assess level of consciousness frequently. Monitor vital signs and airway closely. ECG monitoring and oxygenation via pulse oximetry is highly recommended. Observe continually for resedation, respiratory depression, preseizure activity, or other residual benzodiazepine effects. May require pain medication sooner after reversal. Assess for nausea and vomiting.

Patient Education Flumazenil does not consistently reverse amnesia. Do not engage in activities requiring alertness for 18-24 hours after discharge. Avoid alcohol or OTC medications for 24 hours after receiving this medication, unless approved by prescriber. Resedation may occur in patients on long-acting benzodiazepines (such as diazepam). **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: 0.1 mg/mL (5 mL, 10 mL)

Romazicon®: 0.1 mg/mL (5 mL, 10 mL) [contains edetate disodium]

Generic Available Yes

Manufacturer Roche Laboratories Inc

Mechanism of Action Competitively inhibits the activity at the benzodiazepine receptor site on the GABA/benzodiazepine receptor complex. Flumazenil does not antagonize the CNS effect of drugs affecting GABA-ergic neurons by means other than the benzodiazepine receptor (ethanol, barbiturates, general anesthetics) and does not reverse the effects of opioids

Pharmacodynamics/Kinetics

Onset of action: 1-3 minutes; 80% response within 3 minutes

Peak effect: 6-10 minutes

Duration: Resedation: ~1 hour; duration related to dose given and benzodiazepine plasma concentrations; reversal effects of flumazenil may wear off before effects of benzodiazepine

Distribution: Initial V_d: 0.5 L/kg; V_{dss} 0.77-1.6 L/kg

Protein binding: 40% to 50%

Metabolism: Hepatic; dependent upon hepatic blood flow

Half-life elimination: Adults: Alpha: 7-15 minutes; Terminal: 41-79 minutes; Moderate hepatic dysfunction: 1.3 hours; severe hepatic impairment: 2.4 hours

Excretion: Feces; urine (0.2% as unchanged drug)

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Anesthesia and Critical Care Concerns/Other Considerations Flumazenil does **not** antagonize the CNS effects of other GABA agonists (such as ethanol, barbiturates, or general anesthetics), nor does it reverse narcotics.

Flunarizine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(floo NAR i zeen)
Canadian Brand NamesApo-Flunarizine®; Novo-Flunarizine; Sibelium®
Pharmacologic CategoryCalcium Channel Antagonist
Use: Labeled IndicationsProphylaxis of classic (with aura) or common (without aura) migraine; symptomatic treatment of vestibular vertigo (due to a diagnosed functional disorder of the vestibular system)
Storage

Store at room temperature. Protect from light and moisture.

RestrictionsNot available in U.S.
ContraindicationsHypersensitivity to flunarizine, any component of the formulation, or other calcium channel antagonist; depression; Parkinson's disease, or other extrapyramidal disorders
Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving). Monitor for fatique symptoms.

- Depression: May precipitate depression; greater risk in younger patients. Monitor for depressive symptoms.

- Extrapyramidal symptoms: May produce extrapyramidal symptoms in individuals with no prior history of neurological deficits; risk is increased in elderly patients. Monitor for symptoms.

Disease-related concerns:

- Acute migraines: Not indicated for treatment of acute migraine attacks.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: Do not exceed recommended dose; discontinue use if therapeutic effects diminish during treatment.

Pregnancy ConsiderationsNo data to support use during pregnancy; weigh benefits versus potential risks
LactationExcretion in breast milk unknown/not recommended
Adverse ReactionsFrequency not defined.

Central nervous system: Anxiety, dizziness, drowsiness, fatigue, insomnia, vertigo

Dermatologic: Rash

Endocrine & metabolic: Galactorrhea, prolactin levels increased

Gastrointestinal: Appetite increased, epigastric pain, heartburn, nausea, vomiting, weight gain, xerostomia

Neuromuscular & skeletal: Asthenia/weakness, muscle ache

Metabolism/Transport Effects**Substrate** of CYP2D6
Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

CarBAMazepine: May decrease the serum concentration of Flunarizine. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Phenytoin: May decrease the serum concentration of Flunarizine. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Concurrent use may result in excessive sedation.
Monitoring ParametersMonitor for extrapyramidal, depressive, and/or fatigue symptoms and discontinue therapy with flunarizine if observed.
Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents or herbal products patient may be taking. Assess effectiveness (according to purpose for use) and adverse response (extrapyramidal symptoms, CNS changes, gastrointestinal disturbance). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.
Patient EducationDo not take any new prescription or over-the-counter medications or herbal products during therapy unless approved by

prescriber. This medication is not to be used for acute migraine attacks; it may help prevent migraine headaches. Take exactly as directed; take several weeks for effects to be noticed. May cause drowsiness, dizziness, anxiety, or fatigue (use caution when driving or engaging in tasks requiring alertness until response to drug in known); nausea, vomiting, heartburn, dry mouth (small, frequent meals, frequent mouth care may help, chewing gum, or sucking lozenges may help). Report rash; muscle aches, weakness, or tremors; unusual anxiety or confusion; rapid heartbeat, or other persistent adverse effects. **Breast-feeding precaution**: Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Capsule:

Apo-Flunarizine® [CAN], Novo-Flunarizine [CAN], Sibelium® [CAN]: 5 mg [not available in the U.S.]

Generic AvailableYes

Mechanism of ActionFlunarizine is a selective calcium channel antagonist that prevents cellular calcium overload by reducing transmembrane calcium influx; also has antihistamine properties.

Pharmacodynamics/Kinetics

Absorption: Well absorbed

Distribution: V_d: Mean: 43.2 L/kg

Protein binding: 99%

Metabolism: Hepatic: N-oxidation, aromatic hydroxylation

Half-life elimination: ~19 days

Time to peak, plasma: 2-4 hours

Excretion: Urine (minimal)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause anxiety, drowsiness, dizziness, or insomnia

Mental Health: Effects on Psychiatric TreatmentContraindicated in patients with depression, Parkinson's disease, or other extrapyramidal disorders (increases prolactin). Concomitant use with psychotropics may produce additive sedative effects. Fluoxetine and paroxetine may increase the effects of flunarizine.

Index TermsFlunarizine Hydrochloride

English English

Jump To Field (Select Field Name)

Special Alerts

Aerospan™" Product Availability: August 2008

Aerospan™ was approved by the Food and Drug Administration (FDA) in January 2006. A product launch date has not been determined.

Medication Safety Issues

Sound-alike/look-alike issues:

Flunisolide may be confused with Flumadine®, fluocinonide

Nasarel® may be confused with Nizoral®

Pronunciation(floo NISS oh lide)
U.S. Brand NamesAeroBid®; AeroBid®-M; Nasarel®
Canadian Brand NamesAlti-Flunisolide; Apo-Flunisolide®; Nasalide®; PMS-Flunisolide; Rhinalar®
Pharmacologic CategoryCorticosteroid, Inhalant (Oral); Corticosteroid, Nasal
Use: Labeled IndicationsSteroid-dependent asthma; nasal solution is used for seasonal or perennial rhinitis
Dosing: Adults**Note:** AeroBid® and Aerospan™ are not interchangeable; dosing changes when switching from one to the other.

Asthma: Oral Inhalation:

AeroBid®: 2 inhalations twice daily (morning and evening); up to 8 inhalations/day maximum

NIH Asthma Guidelines (NIH, 2007) (administer in divided doses twice daily):

"Low" dose: 500-1000 mcg/day

"Medium" dose: >1000-2000 mcg/day

"High" dose: >2000 mcg/day

Aerospan™: 2 inhalations twice daily; up to 8 inhalations/day

NIH Asthma Guidelines (NIH, 2007) (administer in divided doses twice daily):

"Low" dose: 320 mcg/day

"Medium" dose: >320-640 mcg/day

"High" dose: >640 mcg/day

Seasonal allergic rhinitis: Intranasal: 2 sprays each nostril twice daily (morning and evening); may increase to 2 sprays 3 times daily; maximum dose: 8 sprays/day in each nostril (400 mcg/day)

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Note:** AeroBid® and Aerospan™ are not interchangeable; dosing changes when switching from one to the other.

Asthma: Oral Inhalation:

AeroBid®:

Children 6-15 years: 2 inhalations twice daily (morning and evening); up to 4 inhalations/day

Children ≥16 years: Refer to adult dosing.

NIH Asthma Guidelines (NIH, 2007) (administer in divided doses twice daily):

Children 5-11 years:

"Low" dose: 500-750 mcg/day

"Medium" dose: 1000-1250 mcg/day

"High" dose: >1250 mcg/day

Children ≥12 years: Refer to adult dosing.

Aerospan™:

Children 6-11 years: 1 inhalation twice daily; up to 4 inhalations/day

Children ≥12 years: Refer to adult dosing.

NIH Asthma Guidelines (NIH, 2007) (administer in divided doses twice daily):

Children 5-11 years:

"Low" dose: 160 mcg/day

"Medium" dose: 320 mcg/day

"High" dose: ≥640 mcg/day

Children ≥12 years: Refer to adult dosing.

Seasonal allergic rhinitis: Intranasal:

Children 6-14 years: 1 spray each nostril 3 times daily **or** 2 sprays in each nostril twice daily; not to exceed 4 sprays/day in each nostril (200 mcg/day)

Children ≥15 years: Refer to adult dosing.

Administration: InhalationShake well before using. Rinse mouth following use of oral inhalers.

Aerospan™: Has a self-contained spacer; do not use with another spacer. Prime inhaler prior to first use. Begin inhalation immediately prior to actuation; a delay may reduce dose by ≥75%.

Storage

Aerospan™: Store at 15°C to 30°C (59°F to 86°F). Do not store near heat or flame. Protect from freezing and sunlight.

AeroBid®: Store below 49°C (below 120°F).

ContraindicationsHypersensitivity to flunisolide or any component of the formulation; acute status asthmaticus; viral, tuberculosis, fungal, or bacterial respiratory infections; infections of the nasal mucosa

Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal suppression: May cause hypercorticism or suppression of hypothalamic-pituitary-adrenal (HPA) axis, particularly in younger children or in patients receiving high doses for prolonged periods. HPA axis suppression may lead to adrenal crisis. Withdrawal and discontinuation of a corticosteroid should be done slowly and carefully. Particular care is required when patients are transferred from systemic corticosteroids to inhaled products due to possible adrenal insufficiency or withdrawal from steroids, including an increase in allergic symptoms. Patients receiving >20 mg per day of prednisone (or equivalent) may be most susceptible. Fatalities have occurred due to adrenal insufficiency in asthmatic patients during and after transfer from systemic corticosteroids to aerosol steroids; aerosol steroids do **not** provide the systemic steroid needed to treat patients having trauma, surgery, or infections. Do not use this product to transfer patients from oral corticosteroid therapy.

- Bronchospasm: May occur with wheezing after inhalation; if this occurs stop steroid and treat with a fast-acting bronchodilator.

- Delayed wound healing: Avoid nasal corticosteroid use in patients with recent nasal septal ulcers, nasal surgery or nasal trauma until healing has occurred.

- Immunosuppression: Prolonged use of corticosteroids may also increase the incidence of secondary infection, mask acute infection (including fungal infections), prolong or exacerbate viral infections, or limit response to vaccines. Exposure to chickenpox should be avoided; corticosteroids should not be used to treat ocular herpes simplex. Corticosteroids should not be used for cerebral malaria. Close observation is required in patients with latent tuberculosis and/or TB reactivity; restrict use in active TB (only in conjunction with antituberculosis treatment).

- Kaposi's sarcoma: Prolonged treatment with corticosteroids has been associated with the development of Kaposi's sarcoma (case reports); if noted, discontinuation of therapy should be considered.

- Psychiatric disturbances: Corticosteroid use may cause psychiatric disturbances, including depression, euphoria, insomnia, mood swings, and personality changes. Pre-existing psychiatric conditions may be exacerbated by corticosteroid use.

Disease-related concerns:

- Asthma: Supplemental steroids (oral or parenteral) may be needed during stress or severe asthma attacks. Not to be used in status asthmaticus or for the relief of acute bronchospasm.

- Cardiovascular disease: Use with caution in patients with HF; long-term use has been associated with fluid retention and hypertension.

- Diabetes: Use with caution in patients with diabetes mellitus; may alter glucose production/regulation leading to hyperglycemia.

- Gastrointestinal disease: Use with caution in patients with GI diseases (diverticulitis, peptic ulcer, ulcerative colitis) due to perforation risk.

- Hepatic impairment: Use with caution in patients with hepatic impairment, including cirrhosis; long-term use has been associated with fluid retention.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis; exacerbation of symptoms has occurred especially during initial treatment with corticosteroids.

- Myocardial infarct (MI): Use with caution following acute MI; corticosteroids have been associated with myocardial rupture.

- Ocular disease: Use with caution in patients with cataracts and/or glaucoma; increased intraocular pressure, open-angle glaucoma, and cataracts have occurred with prolonged use. Consider routine eye exams in chronic users.

- Osteoporosis: Use with caution in patients with osteoporosis; high doses and/or long-term use of corticosteroids have been associated with increased bone loss and osteoporotic fractures.

- Renal impairment: Use with caution in patients with renal impairment; fluid retention may occur.

- Seizure disorders: Use with caution in patients with a history of seizure disorder; seizures have been reported with adrenal crisis.

- Thyroid disease: Changes in thyroid status may necessitate dosage adjustments; metabolic clearance of corticosteroids increases in hyperthyroid patients and decreases in hypothyroid ones.

Special populations:

- Pediatrics: Orally-inhaled and intranasal corticosteroids may cause a reduction in growth velocity in pediatric patients (~1 centimeter per year [range 0.3-1.8 cm per year] and related to dose and duration of exposure). To minimize the systemic effects of orally-inhaled and intranasal corticosteroids, each patient should be titrated to the lowest effective dose. Growth should be routinely monitored in pediatric patients.

Other warnings/precautions:

- Discontinuation of therapy: Withdraw systemic therapy with gradual tapering of dose. There have been reports of systemic corticosteroid withdrawal symptoms (eg, joint/muscle pain, lassitude, depression) when withdrawing oral inhalation therapy.

Geriatric ConsiderationsMany elderly patients have difficulty using metered dose inhalers, which can limit their effectiveness. Assess technique in all older patients. A spacer device may be beneficial for the oral inhaler. Aerospan™ has its own spacer device attached to the unit and may be easier to use for elderly patients.

Pregnancy Risk FactorC

Pregnancy ConsiderationsNo data on crossing the placenta or effects on the fetus.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%:

Central nervous system: Headache (intranasal <5%; oral 9% to 25%)

Gastrointestinal: Aftertaste (10% to 17%)

Respiratory: Nasal burning (intranasal 45%), pharyngitis (14% to 20%), rhinitis (<15%), nasal irritation (>1% to 13%)

1% to 10%:

Cardiovascular: Chest pain (1% to 3%), edema (1% to 3%), chest tightness, hypertension, palpitation, tachycardia

Central nervous system: Fever (1% to 9%), dizziness (1% to 3%), insomnia (1% to 3%), migraine (1% to 3%), chills, malaise, irritability, shakiness, anxiety, depression, faintness, fatigue, moodiness, vertigo

Dermatologic: Erythema multiform (1% to 3%), acne, eczema, pruritus, urticaria

Endocrine & metabolic: Dysmenorrhea (1% to 3%)

Gastrointestinal: Dyspepsia (2% to 4%), abdominal pain (1% to 3%), diarrhea (1% to 10%), gastroenteritis (1% to 3%), nausea (Aerospan™: 1% to 3%), oral candidiasis (1% to 3%), taste perversion (1% to 3%), abdominal fullness, constipation, gas, heartburn, sore throat, dry throat, mouth discomfort, throat irritation

Genitourinary: Vaginitis (1% to 3%), urinary tract infection (1% to 4%)

Neuromuscular & skeletal: Myalgia (1% to 3%), neck pain (1% to 3%), numbness, weakness

Ocular: Conjunctivitis (1% to 3%), blurred vision

Renal: Laryngitis (1% to 3%)

Respiratory: Sinusitis (<9%), epistaxia (<3%), bronchospasm, cough increased, dyspnea, hoarseness, nasal ulcer, sneezing, wheezing

Miscellaneous: Allergy (4% to 5%), infection (3% to 9%), loss of smell, voice alteration (1% to 3%), flu-like syndrome, diaphoresis

<1%: Adrenal suppression

Metabolism/Transport Effects

Substrate of CYP3A4 (major)

Drug Interactions

Amphotericin B: Corticosteroids (Orally Inhaled) may enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Antidiabetic Agents: Corticosteroids (Orally Inhaled) may diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Loop Diuretics: Corticosteroids (Orally Inhaled) may enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Thiazide Diuretics: Corticosteroids (Orally Inhaled) may enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Nursing: Physical Assessment/MonitoringNot to be used to treat status asthmaticus or fungal infections of nasal passages. Monitor therapeutic effectiveness and adverse reactions. When changing from systemic steroids to inhalational steroid, taper reduction of systemic medication slowly. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationThis medication is not intended to treat an acute asthma attack. Full benefit of regular use may not be seen for 2-4 weeks. Use as directed; do not use nasal preparations for oral inhalation. Do not increase dosage or discontinue abruptly without consulting prescriber. Review use of inhaler or spray with prescriber or follow package insert for directions. Keep oral inhaler clean and unobstructed. Always rinse mouth and throat after use of inhaler to prevent opportunistic infection. If you are also using an inhaled bronchodilator, wait 10 minutes before using this steroid aerosol. You may be susceptible to infections. Avoid measles and chickenpox. You may experience dizziness, anxiety, or blurred vision (rise slowly from sitting or lying position and use caution when driving or engaging in tasks requiring alertness until response to drug is known); or taste disturbance or aftertaste (frequent mouth care and mouth rinses may help). Report pounding heartbeat or chest pain; acute nervousness or inability to sleep; severe sneezing or nosebleed; respiratory difficulty, sore throat, hoarseness, or bronchitis; respiratory difficulty or bronchospasms; disturbed menstrual pattern; vision changes; loss of taste or smell perception; or worsening of condition or lack of improvement. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Inhaler: Sit when using. Take deep breaths for 3-5 minutes, and clear nasal passages before administration (use decongestant as needed). Hold breath for 5-10 seconds after use, and wait 1-3 minutes between inhalations. Follow package insert instructions for use. Do not exceed maximum dosage. If also using inhaled bronchodilator, use before flunisolide. Rinse mouth and throat after use to reduce aftertaste and prevent candidiasis.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Aerosol for oral inhalation:

AeroBid®: 250 mcg/actuation (7 g) [100 metered inhalations; contains chlorofluorocarbon]

AeroBid®-M: 250 mcg/actuation (7 g) [100 metered inhalations; contains chlorofluorocarbon; menthol flavor]

Solution, intranasal [spray]: 25 mcg/actuation (25 mL); 29 mcg/actuation (25 mL) [200 sprays]

Nasarel®: 29 mcg/actuation (25 mL) [200 sprays; contains benzalkonium chloride]

Generic AvailableYes: Nasal spray

Pricing: U.S. (www.drugstore.com)

Aerosol solution (Aerobid)

250 mcg/ACT (7): $88.38

Aerosol solution (Aerobid-M)

250 mcg/ACT (7): $84.99

Solution (Flunisolide)

0.025% (25): $39.99

29 mcg/ACT (25): $45.99

Solution (Nasarel)

29 mcg/ACT (25): $59.99

Mechanism of ActionDecreases inflammation by suppression of migration of polymorphonuclear leukocytes and reversal of increased capillary permeability; does not depress hypothalamus

Pharmacodynamics/Kinetics

Absorption: Nasal inhalation: ~50%

Metabolism: Rapidly hepatic to active metabolites

Bioavailability: 40% to 50%

Half-life elimination: 1.8 hours

Excretion: Urine and feces (equal amounts)

Related Information

- Asthma
- Inhalant Agents
- Status Epilepticus

Pharmacotherapy PearlsAerospan™and AeroBid® doses are not interchangeable because of differences in delivery characteristics.

Effects of inhaled/intranasal steroids on growth have been observed in the absence of laboratory evidence of HPA axis suppression, suggesting that growth velocity is a more sensitive indicator of systemic corticosteroid exposure in pediatric patients than some commonly used tests of HPA axis function. The long-term effects of this reduction in growth velocity associated with orally-inhaled and intranasal corticosteroids, including the impact on final adult height, are unknown. The potential for “catch up” growth following discontinuation of treatment with inhaled corticosteroids has not been adequately studied.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: *Candida* infections of the nose or pharynx, atrophic rhinitis, sore throat, bitter taste, palpitations, dizziness, headache, nervousness, GI irritation, sneezing, coughing, upper respiratory tract infection, bronchitis, nasal congestion, nasal dryness and burning, increased susceptibility to infections, xerostomia (normal salivary flow resumes upon discontinuation), dry throat, loss of taste, epistaxis, and diaphoresis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness and nervousness are common; may cause insomnia

Mental Health: Effects on Psychiatric TreatmentNone reported

Anesthesia and Critical Care Concerns/Other Considerations

Surgery: For patients who have received oral systemic corticosteroids during the past 6 months and for selected patients on long-term, high-dose, inhaled corticosteroid (ICS), give stress doses of hydrocortisone intravenously during the surgical period and reduce the dose rapidly within 24 hours after surgery (Expert Panel Report 3, 2007). Clinically important adrenal suppression has been reported in patients receiving high doses of an ICS, particularly children.

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(floo oh SIN oh lone, HYE droe kwin one, & TRET i noyn)

U.S. Brand NamesTri-Luma™

Pharmacologic CategoryCorticosteroid, Topical; Depigmenting Agent; Retinoic Acid Derivative

Use: Labeled IndicationsShort-term treatment of moderate to severe melasma of the face

Dosing: AdultsMelasma: Topical: Apply a thin film once daily to hyperpigmented areas of melasma (including $^1/_2$ inch of normal-appearing surrounding skin). Apply 30 minutes prior to bedtime; not indicated for use beyond 8 weeks. Do not use occlusive dressings.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNo dosage adjustment required.

Administration: TopicalApply 30 minutes before bedtime. Wash face with mild cleanser; rinse and pat dry. Apply to lesion and $^1/_2$ inch of normal-appearing skin surrounding each lesion. Rub lightly and uniformly into the skin. Do not use occlusive dressings.

StorageStore at 20°C to 25°C (68°F to 77°F).

ContraindicationsHypersensitivity to fluocinolone, hydroquinone, tretinoin, or any component of the formulation; TB of skin, herpes (including varicella); sulfite allergy

Allergy Considerations

- Corticosteroid Allergy
- Retinoid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal suppression: Systemic absorption of topical corticosteroids may cause hypothalamic-pituitary-adrenal (HPA) axis suppression (reversible) particularly in younger children. HPA axis suppression may lead to adrenal crisis. Risk is increased when used over large surface areas, for prolonged periods, or with occlusive dressings.

- Dermatitis: Cutaneous hypersensitivity/contact dermatitis to individual ingredients has been reported; instruct patients to seek medical attention.

- Exogenous ochronosis: Hydroquinone may produce exogenous ochronosis (gradual blue/black darkening of skin); discontinuation is recommended.

- Kaposi's sarcoma: Prolonged treatment with corticosteroids has been associated with the development of Kaposi's sarcoma (case reports); if noted, discontinuation of therapy should be considered.

- Systemic effects: Adverse systemic effects including hyperglycemia, glycosuria, fluid and electrolyte changes, and HPA suppression may occur when used on large surface areas, for prolonged periods, or with an occlusive dressing.

Concurrent drug therapy issues:

- Hormonal contraceptives: Consider changing to nonhormonal contraceptive measures in patients who may be receiving hormonal contraceptives.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Sodium metabisulfate: Contains sodium metabisulfite; may cause hypersensitivity reactions, including anaphylaxis, in individuals with sulfite allergy.

Other warnings/precautions:

- Darker skin types: Has not been evaluated in skin types V and VI; excessive bleaching may occur in individuals with darker skin.

- Patient information: Instruct patients to avoid UV exposure, including sunlight (protective clothing and sunscreen recommended). Local irritation, dryness, and pruritus may be expected following application. Avoid contact with abraded skin, mucous membranes, eyes, mouth, angles of the nose.

Pregnancy Risk FactorC

Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women. Tretinoin appears to have a low risk of teratogenicity when used topically since it is rapidly metabolized by the skin; however, there are rare reports of fetal defects. Risk may be greatest in 1st trimester. Use topically only if benefit to mother outweighs potential risk to fetus. In general, the use of topical corticosteroids during pregnancy is not considered to have significant risk, however, intrauterine growth retardation in the infant has been reported (rare). The use of large amounts or for prolonged periods of time should be avoided. Consider delaying treatment until after delivery.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding Considerations Avoid contact between nursing infant and cream.

Adverse Reactions

>10%:

Dermatologic: Erythema (41%), desquamation (38%), burning (18%), dry skin (14%), pruritus (11%)

1% to 10%:

Cardiovascular: Telangiectasia (3%)

Central nervous system: Paresthesia (3%), hyperesthesia (2%)

Dermatologic: Acne (5%), pigmentation change (2%), irritation (2%), papules (1%), rash (1%), rosacea (1%), vesicles (1%)

Gastrointestinal: Xerostomia (1%)

<1%: Other reactions reported with one or more components: Acneiform eruptions, allergic contact dermatitis, burning, Cushing's syndrome, folliculitis, HPA axis suppression, hypertrichosis, hypopigmentation, irritation, itching, miliaria, ochronosis (exogenous), perioral dermatitis, secondary infection, skin atrophy, striae

Metabolism/Transport Effects Tretinoin: **Substrate** (minor) of CYP2A6, 2B6, 2C8/9; **Inhibits** CYP2C8/9 (weak); **Induces** CYP2E1 (weak)

Drug Interactions

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Avoid excessive intake of vitamin A (cod liver oil, halibut fish oil).

Herb/Nutraceutical: Avoid dong quai, St John's wort (may also cause photosensitization). Avoid excessive amounts of vitamin A supplements.

Monitoring Parameters Signs/symptoms of HPA axis suppression

Nursing: Physical Assessment/Monitoring See individual agents.

Patient Education See individual agents.

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream, topical: Hydroquinone 4%, tretinoin 0.05%, fluocinolone acetonide 0.01% (30 g) [contains sodium metabisulfite]

Generic Available No

Manufacturer Galderma

Pricing: U.S. (www.drugstore.com)

Cream (Tri-Luma)

0.01-4-0.05% (30): $190.91

Mechanism of Action Not clearly defined. Hydroquinone may interrupt melanin synthesis (tyrosine-tyrosinase pathway); reduces hyperpigmentation.

Pharmacodynamics/Kinetics

Absorption: Minimal

Metabolism: Hepatic for the small amount absorbed

Excretion: Urine and feces

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status None reported

Mental Health: Effects on Psychiatric Treatment Avoid use with drugs possessing photosensitizing effects (psychotropics, especially phenothiazines). Avoid dong quai and St John's wort (may cause photosensitization).

Index Terms Hydroquinone, Fluocinolone Acetonide, and Tretinoin; Tretinoin, Fluocinolone Acetonide, and Hydroquinone

Fluocinolone

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Fluocinolone may be confused with fluocinonide

Pronunciation(floo oh SIN oh lone)
U.S. Brand NamesCapex®; Derma-Smoothe/FS®; DermOtic® ; Retisert®; Synalar® [DSC]
Canadian Brand NamesCapex®; Derma-Smoothe/FS®; Synalar®
Pharmacologic CategoryCorticosteroid, Ophthalmic; Corticosteroid, Topical
Use: Labeled IndicationsRelief of susceptible inflammatory dermatosis [low, medium corticosteroid]; dermatitis or psoriasis of the scalp; atopic dermatitis in adults and children ≥3 months of age

Ocular implant (Retisert®): Treatment of chronic, noninfectious uveitis affecting the posterior segment of the eye

Otic (DermOtic® Oil): Relief of chronic eczematous external otitis in adults and children ≥2 years of age.

Use: DentalRelief of inflammatory and pruritic manifestations (low, medium, high potency topical corticosteroid)
Dosing: Adults

Atopic dermatitis (Derma-Smoothe/FS® body oil): Apply thin film to affected area 3 times/day

Chronic eczematous external otitis: Otic: 5 drops into the affected ear twice daily for 1-2 weeks

Chronic uveitis: Ocular implant: One silicone-encased tablet (0.59 mg) surgically implanted into the posterior segment of the eye is designed to initially release 0.6 mcg/day, decreasing over 30 days to a steady-state release rate of 0.3-0.4 mcg/day for 30 months. Recurrence of uveitis denotes depletion of tablet, requiring reimplantation.

Corticosteroid-responsive dermatoses: Topical: Cream, ointment, solution: Apply a thin layer to affected area 2-4 times/day; may use occlusive dressings to manage psoriasis or recalcitrant conditions

Inflammatory and pruritic manifestations (dental use): Topical: Apply to oral lesion 4 times/day, after meals and at bedtime

Scalp psoriasis (Derma-Smoothe/FS® scalp oil): Topical: Massage thoroughly into wet or dampened hair/scalp; cover with shower cap. Leave on overnight (or for at least 4 hours). Remove by washing hair with shampoo and rinsing thoroughly.

Seborrheic dermatitis of the scalp (Capex®): Topical: Apply no more than 1 ounce to scalp once daily; work into lather and allow to remain on scalp for ~5 minutes. Remove from hair and scalp by rinsing thoroughly with water.

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Atopic dermatitis: Topical: Children ≥3 months (Derma-Smoothe/FS® body oil): Moisten skin; apply a thin filn to affected area twice daily; do not use for longer than 4 weeks

Chronic eczematous external otitis: Otic: Children ≥2 years: Refer to adult dosing.

Chronic uveitis: Ocular implant: Children ≥12 years: Refer to adult dosing.

Corticosteroid-responsive dermatoses: Topical: Refer to adult dosing.

Administration: TopicalApply thin film to affected area; avoid eyes.
Administration: Other

Ocular implant: Handle only by suture tab to avoid damaging the tablet integrity and adversely affecting release characteristics. Maintain strict adherence to aseptic handling of product; do not resterilize.

Storage

Topical: Store at controlled room temperature in tightly-closed container.

Capex®: Store at 15°C to 35°C (59°F to 86°F).

Ocular implant (Retisert®): Store in original container at controlled room temperature of 15°C to 25°C (59°F to 77°F). Do not freeze.

Otic: Store a controlled room temperature of 20°C to 25°C (68°F to 77°F).

ReconstitutionCapex®: Prior to dispensing, the contents of the capsule should be emptied into the liquid shampoo; shake well. Discard after 3 months.

Contraindications Hypersensitivity to fluocinolone or any component of the formulation; TB of skin, herpes (including varicella)

Ocular implant: Additional contraindications include ocular infections of viral, bacterial, or fungal origin; hypersensitivity to other corticosteroids

Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal suppression: May cause hypercorticism or suppression of hypothalamic-pituitary-adrenal (HPA) axis, particularly in younger children or in patients receiving high doses for prolonged periods. HPA axis suppression may lead to adrenal crisis. Withdrawal and discontinuation of a corticosteroid should be done slowly and carefully. Particular care is required when patients are transferred from systemic corticosteroids to inhaled products due to possible adrenal insufficiency or withdrawal from steroids, including an increase in allergic symptoms. Patients receiving >20 mg per day of prednisone (or equivalent) may be most susceptible. Fatalities have occurred due to adrenal insufficiency in asthmatic patients during and after transfer from systemic corticosteroids to aerosol steroids; aerosol steroids do **not** provide the systemic steroid needed to treat patients having trauma, surgery, or infections.

- Contact dermatitis: Allergic contact dermatitis can occur, it is usually diagnosed by failure to heal rather than clinical exacerbation.

- Infection: Steroids may mask infection or enhance existing ocular infection; prolonged use may result in secondary infections due to immunosuppression.

- Ocular effects: Prolonged use may result in glaucoma and injury to the optic nerve. Visual defects in acuity and field of vision may occur (lasting 1-4 weeks postoperatively). Use with caution in presence of glaucoma (steroids increase intraocular pressure). Perforation may occur with topical steroids in diseases which thin the cornea or sclera. Steroid use may delay healing after cataract surgery. Intraocular pressure should be monitored if this product is used >10 days.

- Systemic effects: Adverse systemic effects may occur when used on large areas of the body, denuded areas, for prolonged periods of time, or with an occlusive dressing. Infants and children may be more susceptible to systemic toxicity from equivalent doses due to larger skin surface to body mass ratio.

Special populations:

- Pediatrics: Safety and efficacy of Derma-Smoothe/FS® body oil have not been established in children <3 months of age. Safety and efficacy of the ocular implant have not been established in children <12 years of age. Safety and efficacy of otic drops have not been established in children <2 years of age.

Dosage form specific issues:

- Ocular implant: May require IOP-lowering treatments within 2 years postimplantation. Recommend unilateral implantation only to minimize risk of postoperative infections developing in both eyes. Due to the potential for separation of the silicone cup reservoir from the suture tab, implant integrity should be monitored during eye exams.

- Peanut oil: Derma-Smoothe/FS® and DermOtic® Oil contain peanut oil; use caution in peanut-sensitive individuals.

Topical: Not for oral, ophthalmic or intravaginal use; do not apply to the face, axillae, groin, or diaper area unless directed by healthcare provider. Discontinue use if irritation occurs.

Geriatric Considerations Due to age-related changes in skin, limit use of topical glucocorticosteroids.

Pregnancy Risk Factor C

Pregnancy Considerations There are no adequate and well-controlled studies in pregnant women. In general, the use of topical corticosteroids during pregnancy is not considered to have significant risk, however, intrauterine growth retardation in the infant has been reported (rare). The use of large amounts or for prolonged periods of time should be avoided.

Lactation Excretion in breast milk unknown/use caution

Breast-Feeding Considerations Systemic corticosteroids are excreted in human milk. It is not known if sufficient quantities of fluocinolone are absorbed following topical or ocular administration to produce detectable amounts in breast milk. Hypertension in the nursing infant has been reported following corticosteroid ointment applied to the nipples. Use with caution.

Adverse Reactions **Topical:** Frequency not defined.

Cardiovascular: Intracranial hypertension (rare)

Central nervous system: Telangiectasia

Dermatologic: Acneiform eruptions, allergic contact dermatitis, atopic dermatitis (secondary), burning, dryness, erythema, folliculitis, irritation, itching, hypertrichosis, hypopigmentation, keratosis pilaris, miliaria, papules, perioral dermatitis, pustules, shiny skin, skin atrophy, striae

Endocrine & metabolic: Cushing's syndrome, HPA axis suppression

Otic: Ear infection

Miscellaneous: Herpes simplex, secondary infection

Ocular implant:

>50%: Ocular: Cataract, intraocular pressure increased, eye pain; procedural complications (eg, cataract fragments, implant migration,

wound complications)

10% to 35%:

Central nervous system: Headache (31%), dizziness (5% to 15%), pain (5% to 15%), fever (5% to 15%)

Dermatologic: Rash (5% to 15%)

Gastrointestinal (5% to 15%): Nausea, vomiting

Neuromuscular & skeletal (5% to 15%): Arthralgia, back pain, limb pain

Ocular: Abnormal sensation, blurred vision, conjunctival hemorrhage, conjunctival hyperemia, dry eye, eye irritation/inflammation, eyelid edema, glaucoma, hypotony, maculopathy, pruritus, ptosis, tearing, visual acuity decrease, vitreous floaters, vitreous hemorrhage

Respiratory (5% to 15%): Cough, influenza, nasopharyngitis, sinusitis, upper respiratory infection

5% to 9%: Ocular: Blepharitis, choroidal detachment, conjunctival edema/chemosis, corneal edema, eye discharge, eye swelling, macular edema, photophobia, photopsia, retinal hemorrhage, visual disturbance, vitreous opacitites

Frequency not specified: Miscellaneous: Secondary infection (bacterial, viral, or fungal)

Drug Interactions

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

Monitoring ParametersHPA axis suppression (ACTH stimulation test, AM plasma cortisol test, urinary free cortisol test); signs of bacterial or fungal infection

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess patient response. Teach patient proper use (according to formulation), side effects/appropriate interventions, and symptoms to report. **Ocular implant:** Regular monitoring of intraocular pressure required. Assess for change in vision.

Patient EducationTopical: For external use only. Inform prescriber if you are allergic to peanuts. Do not use for eyes, mucous membranes, or open wounds. Use exactly as directed and for no longer than the period prescribed. Before using, wash and dry area gently. Apply in a thin layer (may rub in lightly). Apply light dressing (if necessary) to area being treated. Do not use occlusive dressing unless so advised by prescriber. Avoid prolonged or excessive use around sensitive tissues, genital, or rectal areas. Avoid exposing treated area to direct sunlight. Inform prescriber if condition worsens (redness, swelling, irritation, signs of infection, or open sores) or fails to improve after 2 weeks.

Ocular implant: A temporary decrease in visual acuity is expected for 1-4 weeks. Discuss changes in vision with prescriber.

Pregnancy/breast-feeding precautions: Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Cream, as acetonide: 0.01% (15 g, 60 g); 0.025% (15 g, 60 g)

Mechanism of ActionA synthetic fluorinated corticosteroid of low to moderate potency. The mechanism of action for all topical corticosteroids is not well defined, however, is believed to be a combination of anti-inflammatory, antipruritic, and vasoconstrictive properties.

Pharmacodynamics/Kinetics

Absorption:

Topical: Dependent on strength of preparation, amount applied, nature of skin at application site, vehicle, and use of occlusive dressing; increased in areas of skin damage, inflammation, or occlusion

Ocular implant: Systemic absorption is negligible

Duration: Ocular implant: Releases fluocinolone acetonide at an initial rate of 0.6 mcg/day, decreasing over 30 days to a steady-state release rate of 0.3-0.4 mcg/day for 30 months

Distribution:

Topical: Throughout local skin; absorbed drug is distributed rapidly into muscle, liver, skin, intestines, and kidneys

Ocular implant: Aqueous and vitreous humor

Metabolism: Primarily in skin; small amount absorbed into systemic circulation is primarily hepatic to inactive compounds

Excretion: Urine (primarily as glucuronide and sulfate, also as unconjugated products); feces (small amounts)

Related Information

Medication Safety Issues

Sound-alike/look-alike issues:

Fluocinonide may be confused with flunisolide, fluocinolone

Lidex® may be confused with Lasix®, Videx®, Wydase®

Pronunciation(floo oh SIN oh nide)

U.S. Brand NamesLidex-E® [DSC]; Lidex® [DSC]; Vanos™

Canadian Brand NamesLidemol®; Lidex®; Lyderm®; Tiamol®; Topsyn®

Pharmacologic CategoryCorticosteroid, Topical

Use: Labeled IndicationsAnti-inflammatory, antipruritic; treatment of plaque-type psoriasis (up to 10% of body surface area) [high-potency topical corticosteroid]

Use: DentalRelief of inflammatory and pruritic manifestations (high potency topical corticosteroid)

Dosing: Adults

Pruritus and inflammation: Topical (0.05% cream): Apply thin layer to affected area 2-4 times/day depending on the severity of the condition. Therapy should be discontinued when control is achieved; if no improvement is seen, reassessment of diagnosis may be necessary.

Plaque-type psoriasis (Vanos™): Topical (0.1% cream): Apply a thin layer once or twice daily to affected areas (limited to <10% of body surface area). **Note:** Not recommended for use >2 consecutive weeks or >60 g/week total exposure. Discontinue when control is achieved.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Pruritus and inflammation: Refer to adult dosing.

Plaque-type psoriasis: Children ≥12 years: Refer to adult dosing.

ContraindicationsHypersensitivity to fluocinonide or any component of the formulation; viral, fungal, or tubercular skin lesions, herpes simplex

Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal suppression: Systemic absorption of topical corticosteroids may cause hypothalamic-pituitary-adrenal (HPA) axis suppression (reversible) particularly in younger children. HPA axis suppression may lead to adrenal crisis. Risk is increased when used over large surface areas, for prolonged periods, or with occlusive dressings.

- Contact dermatitis: Allergic contact dermatitis can occur, it is usually diagnosed by failure to heal rather than clinical exacerbation.

- Kaposi's sarcoma: Prolonged treatment with corticosteroids has been associated with the development of Kaposi's sarcoma (case reports); if noted, discontinuation of therapy should be considered.

- Systemic effects: Adverse systemic effects including hyperglycemia, glycosuria, fluid and electrolyte changes, and HPA suppression may occur when used on large surface areas, for prolonged periods, or with an occlusive dressing.

Special populations:

- Pediatrics: Use of the 0.1% cream in children <12 years of age is not recommended. Chronic use of corticosteroids in children may interfere with growth and development.

Other warnings/precautions:

- Application site: Lower-strength cream (0.05%) may be used cautiously on face or opposing skin surfaces that may rub or touch (eg, skin folds of the groin, axilla, and breasts); higher-strength (0.1%) should not be used on the face, groin, or axillae.

- Duration of therapy: Use of the 0.1% cream for >2 weeks is not recommended.

Geriatric ConsiderationsDue to age-related changes in skin, limit use of topical glucocorticosteroids.

Pregnancy Risk FactorC

Adverse ReactionsFrequency not defined.

Cardiovascular: Intracranial hypertension

Dermatologic: Acne, allergic dermatitis, contact dermatitis, dry skin, folliculitis, hypertrichosis, hypopigmentation, maceration of the skin, miliaria, perioral dermatitis, pruritus, skin atrophy, striae, telangiectasia

Endocrine & metabolic: Cushing's syndrome, growth retardation, HPA suppression, hyperglycemia

Local: Burning, irritation

Renal: Glycosuria

Miscellaneous: Secondary infection

Drug Interactions

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

Fluorescein and Benoxinate

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(FLURE e seen & ben OX i nate)
U.S. Brand NamesEyeFlur; Fluress®; Flurox™
Pharmacologic CategoryAnesthetic, Topical; Diagnostic Agent; Ophthalmic Agent
Use: Labeled IndicationsFor use in ophthalmic procedures when a topical disclosing agent is needed along with an anesthetic
Dosing: Adults

Removal of foreign bodies, sutures, or tonometry: Ophthalmic: Instill 1 or 2 drops (single instillations) into each eye before operating

Deep ophthalmic anesthesia: Ophthalmic: Instill 2 drops into each eye every 90 seconds up to 3 doses

Administration: OtherUse of an eye patch is recommended following application.
StorageStore under refrigeration at 2°C to 8°C (36°F to 46°F). Protect from light. May store at room temperature for up to 1 month.
ContraindicationsHypersensitivity to fluorescein, benoxinate, or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- CNS stimulation/depression: Rarely, CNS stimulation followed by depression may occur following topical application of local anesthetics.

Disease-related concerns:

- Allergies/asthma: Use with caution in patients with history of hypersensitivity, allergies, or asthma.
- Cardiovascular disease: Use with caution in patients with cardiovascular disease.
- Hyperthyroidism: Use with caution in patients with hyperthyroidism.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: For ophthalmic use only.
- Prolonged use: Delayed wound healing and/or permanent corneal opacification with vision loss may occur with prolonged use (not recommended).

Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted. Refer to Fluorescein monograph.
Breast-Feeding ConsiderationsRefer to Fluorescein monograph.
Adverse ReactionsFrequency not defined.

Dermatologic: Contact dermatitis, drying/fissuring of fingertips

Ocular: Conjunctival redness, burning, stinging

> Hyperallergic corneal reaction has also been reported and includes acute, intense and diffuse epithelial keratitis; gray ground glass appearance; sloughing or large areas of necrotic epithelium; corneal filaments; iritis with descemetitis

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, ophthalmic: Fluorescein sodium 0.25% and benoxinate hydrochloride 0.4% (5 mL)

> EyeFlur, Fluress®, Flurox™: Fluorescein sodium 0.25% and benoxinate hydrochloride 0.4% (5 mL)

Generic AvailableYes
Mechanism of ActionFluorescein is a diagnostic dye; benoxinate is a rapid acting anesthetic with short duration.
Related Information

- Fluorescein

Index TermsBenoxinate Hydrochloride and Fluorescein Sodium

Fluorescein

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(FLURE e seen)

U.S. Brand NamesAK-Fluor®; Angiofluor™; Angiofluor™ Lite; Fluorescite®; Fluorets®; Ful-Glo®

Canadian Brand NamesFluorescite®

Pharmacologic CategoryDiagnostic Agent

Use: Labeled Indications

Injection: Diagnostic aid in ophthalmic angiography and angioscopy

Topical: To stain the anterior segment of the eye for procedures (such as fitting contact lenses), disclosing corneal injury, and in applanation tonometry

Dosing: Adults

Diagnostic aid:*Ophthalmic: Strips:* Moisten strip with sterile water, saline or ophthalmic fluid. Touch conjunctiva or fornix with tip of strip until adequately stained. For best results, patient should blink several times after application.

Angiography:*Injection:* 500-750 mg injected rapidly into antecubital vein

> **Note:** Prior to use, an intradermal test dose of 0.05 mL may be used if an allergy is suspected. Evaluate 30-60 minutes following intradermal injection.
>
> *Oral:* 1 g of injection solution has been administered orally in patients with inaccessible veins and when early phases of an angiogram are not needed.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Diagnostic aid: Ophthalmic: Refer to adult dosing.

Angiography: I.V.: 3.5 mg/lb (7.7 mg/kg) injected rapidly into antecubital vein

> **Note:** Prior to use, an intradermal test dose of 0.05 mL may be used if an allergy is suspected. Evaluate 30-60 minutes following intradermal injection.

Dosing: Renal ImpairmentInjection: Dialysis patients: Decrease dose by 50%

Administration: I.V.

Luminescence appears in the eye in 7-30 seconds following injection. A scalp (butterfly) needle attached to a small syringe is suggested for administration. Prior to turning off room light, steps should be taken to ensure the needle has not extravasated. Immediate treatment for anaphylaxis (including epinephrine 1:1000) should be available and premedication or a test dose may be advised in some patients. Maintain venous access following procedure in the event treatment is needed for anaphylaxis. Inject at a rate of 1 mL/second.

Administration: I.V. DetailpH: 8-9.8

Administration: OralThe injection has been administered orally in patients with inaccessible veins. Four grams of sugar or 1 teaspoonful of artificial sweetener may be added to decrease the bitterness of the solution. Luminescence appears in 10-15 minutes.

Storage

Injection: Store at controlled room temperature; protect from freezing. Protect from light.

Ophthalmic strips: Store at controlled room temperature.

ContraindicationsHypersensitivity to fluorescein or any other component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity reactions: Hypersensitivity and anaphylactic reactions can occur following injection; immediate treatment (including epinephrine 1:1000) should be available. Premedicating some patients (eg, antihistamines, corticosteroids) may be advisable. An intradermal skin test may be performed prior to use when allergy is suspected.

- Skin/urine discoloration: Following use of the injection, skin may temporarily turn a yellow color and should fade in 6-12 hours. Urine may appear bright yellow for 24-36 hours.

Disease-related concerns:

- Allergies/asthma: Use with caution in patients with history of hypersensitivity, allergies, or asthma.

Special populations:

- Contact lens wearers: Should not be used in patients with soft contact lenses, will cause them to discolor. Flush eyes with saline following use and wait at least 1hour prior to replacing contact lenses.

Dosage form specific issues:

- Injection: For administration via antecubital vein only; not for intrathecal or arterial injection. Avoid extravasation; severe local tissue damage may result.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted. Some manufacturers suggest avoiding angiography during the 1st trimester of pregnancy.

LactationExcreted in breast milk/use caution

Breast-Feeding ConsiderationsMilk discoloration may occur following fluorescein injection.

Adverse Reactions

Injection: Frequency not always defined.

Cardiovascular: Cardiac arrest, basilar artery ischemia, hypotension, MI, shock, syncope

Central nervous system: Convulsions, dizziness, headache, pyrexia

Dermatologic: Angioneurotic edema, eczematous dermatitis (delayed), hives, itching, urticaria, pruritus

Gastrointestinal: GI distress, nausea (1% to 15%), taste disturbance, vomiting

Local: Injection site: Dermatitis, thrombophlebitis

Following extravasation: Intense pain at site, dull aching pain in arm of injection, skin sloughing, subcutaneous granuloma, superficial phlebitis, toxic neuritis

Respiratory: Bronchospasm, dyspnea (transient)

Miscellaneous: Anaphylaxis, hypersensitivity reactions

Postmarketing and/or case reports: Hemolytic anemia, localized nerve palsy, pulmonary edema (acute), respiratory arrest, sickle crisis

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersInjection: Monitor for hypersensitivity reactions during procedure and for 30 minutes after.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as sodium: 10% (5 mL); 25% (2 mL)

AK-Fluor, Angiofluor™, Angiofluor™ Lite, Fluorescite®: 10% (5 mL); 25% (2 mL)

Strip, ophthalmic, as sodium: 1 mg

Fluorets®: 1 mg (100)

Ful-Glo®: 0.6 mg (300); 1 mg (300)

Generic AvailableYes

Mechanism of ActionYellow, water soluble, dibasic acid xanthine dye which penetrates any break in epithelial barrier to permit rapid penetration

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Canadian Brand NamesFluor-A-Day

Pharmacologic Category[Nutritional Supplement]

Use: Labeled IndicationsPrevention of dental caries

Use: DentalPrevention of dental caries

Dosing: AdultsPrevention of dental caries: Oral:

The recommended daily dose of oral fluoride supplement (mg), based on fluoride ion content (ppm) in drinking water (2.2 mg of sodium fluoride is equivalent to 1 mg of fluoride ion): See table.

Fluoride Ion

Fluoride Content of Drinking Water	**Daily Dose, Oral (mg)**
<0.3 ppm	
Birth - 6 mo	None
6 mo - 3 y	0.25
3-6 y	0.5
6-16 y	1
0.3-0.6 ppm	
Birth - 6 mo	None
6 mo - 3 y	None
3-6 y	0.25
6-16 y	0.5
Table from: Recommended dosage schedule of The American Dental Association, The American Academy of Pediatric Dentistry, and The American Academy of	

Pediatrics

Cream: Brush teeth with cream once daily regardless of fluoride content of drinking water.

Dental rinse or gel: 10 mL rinse or apply to teeth daily and spit after brushing

Product-specific dosing:

PreviDent® rinse: Once weekly, rinse 10 mL vigorously around and between teeth for 1 minute, then spit; this should be done preferably at bedtime, after thoroughly brushing teeth; for maximum benefit, do not eat, drink, or rinse mouth for at least 30 minutes after treatment; do not swallow

Fluorinse®: Once weekly, vigorously swish 5-10 mL in mouth for 1 minute, then spit

Lozenge (Lozi-Flur™): One lozenge daily regardless of fluoride content of drinking water

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricPrevention of dental caries: Oral:

Cream: Children ≥6 years: Refer to adult dosing.

Dental rinse or gel: Children 6-12 years: 5-10 mL rinse or apply to teeth and spit daily after brushing

Fluorinse®, PreviDent® rinse: Children >6 years: Refer to adult dosing.

Dietary ConsiderationsDo not administer with milk; do **not** allow eating or drinking for 30 minutes after use.
StorageStore in tight plastic containers (not glass).
ContraindicationsHypersensitivity to fluoride, tartrazine, or any component of the formulation; when fluoride content of drinking water exceeds 0.7 ppm; low sodium or sodium-free diets; do not use 1 mg tablets in children <3 years of age or when drinking water fluoride content is ≥0.3 ppm; do not use 1 mg/5 mL rinse (as supplement) in children <6 years of age
Warnings/Precautions

Concerns related to adverse effects:

- Dental fluorosis/osseous: Prolonged ingestion with excessive doses may result in dental fluorosis and osseous changes; do **not** exceed recommended dosage.

Dosage form specific issues:

- Tartrazine: Some products contain tartrazine.

Geriatric ConsiderationsPostmenopausal women taking high doses of sodium fluoride have increased their bone density in the lumbar spine by 35% with a smaller increase in the femoral neck. In spite of these increases, the overall rate of vertebral fracture did not decline significantly while the rate of hip fracture increased. The results of a randomized, placebo-controlled trial using an investigational slow-release fluoride formulation at a lower dose (50 mg/day) are encouraging. Patients who received fluoride for 1 year or more had a lower vertebral fracture rate and substantial increase in L2-L4 bone mass and femoral neck bone density compared to placebo. Both groups took calcium. At the present time, restricted to investigational protocols.
Pregnancy Risk FactorC
Adverse Reactions<1%: Rash, nausea, vomiting; products containing stannous fluoride may stain the teeth
Drug InteractionsThere are no known significant interactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Cream, oral, as sodium [toothpaste]: 1.1% (51 g) [fluoride 2.5 mg/dose]

Denta 5000 Plus: 1.1% (51 g) [fluoride 2.5 mg/dose; spearmint flavor]

EtheDent™: 1.1% (51 g) [fluoride 2.5 mg/dose]

Gel-drops, as sodium fluoride:

Thera-Flur-N®: 1.1% (24 mL) [fluoride 0.5%; neutral pH; no artificial color or flavor] [DSC]

Gel, topical, as acidulated phosphate fluoride:

Phos-Flur®: 1.1% (60 g) [fluoride 0.5%; cherry and mint flavors]

Gel, topical, as sodium fluoride: 1.1% (56 g) [fluoride 2 mg/dose]

DentaGel, EtheDent™: 1.1% (56 g) [fluoride 2 mg/dose; fresh mint flavor]

NeutraCare®: 1.1% (60 g) [neutral pH; grape and mint flavors]

NeutraGard® Advanced: 1.1% (60 g) [cinnamon and mint flavors]

PreviDent®: 1.1% (60 g) [fluoride 2 mg/dose; berry and mint flavors]

Gel, topical, as stannous fluoride:

Gel-Kam®: 0.4% (129 g) [cinnamon, fruit/berry, and mint flavors]

- Just for Kids™: 0.4% (122 g) [bubble gum, fruit punch, and grapey grape flavors]
- Omnii Gel™: 0.4% (122 g) [cinnamon, grape, natural, mint, and raspberry flavors]
- StanGard®: 0.4% (122 g) [bubble gum, cherry, mint, and raspberry flavors]
- Stop®: 0.4% (120 g) [bubble gum, cinnamon, grape, and mint flavors]

Lozenge, as sodium:

- Lozi-Flur™: 2.21 mg [fluoride 1 mg; cherry flavor]

Paste, oral, as sodium [toothpaste]:

- ControlRx®: 1.1% (56 g) [vanilla mint flavor]

Solution, oral drops, as sodium: 1.1 mg/mL (50 mL) [fluoride 0.5 mg/mL]

- Flura-Drops®: 0.55 mg/drop (24 mL) [fluoride 0.25 mg/drop; dye free, sugar free]
- Luride®: 1.1 mg/mL (50 mL) [fluoride 0.5 mg/mL; sugar free] [DSC]

Solution, oral rinse, as sodium:

- ACT®: 0.05% (530 mL) [fluoride 0.02%; bubble gum, cinnamon (contains tartrazine), and mint flavors]
- ACT® Plus: 0.05% (530 mL) [fluoride 0.02%; alcohol free; icy cool mint flavor]
- ACT® x2™: 0.5% (530 mL) [fluoride 0.02%; contains alcohol 11%; icy cool mint and spearmint flavors]
- CaviRinse™: 0.2% (240 mL) [mint flavor]
- Fluorigard®: 0.05% (480 mL) [alcohol free, sugar free; contains sodium benzoate and tartrazine; mint flavor]
- Fluorinse®: 0.2% (480 mL) [alcohol free; cinnamon and mint flavors]
- NeutraGard®: 0.05% (480 mL) [neutral pH; mint and tropical blast flavors]
- NeutraGard® Plus: 0.2% (480 mL) [neutral pH; mint and tropical blast flavors]
- Phos-Flur®: 0.44% (500 mL) [bubble gum, cherry, grape, and mint flavors]
- PreviDent®: 0.2% (250 mL) [contains alcohol; mint flavor]

Solution, oral rinse concentrate, as stannous fluoride:

- Gel-Kam®: 0.63% (300 mL) [fluoride 0.1%/dose; cinnamon and mint flavors]
- PerioMed™: 0.63% (284 mL) [fluoride 7 mg/30 mL; alcohol free; cinnamon, mint and tropical fruit flavors]
- StanGard® Perio: 0.63% (284 mL) [mint flavor]

Tablet, chewable, as sodium: 0.5 mg [fluoride 0.25 mg]; 1.1 mg [fluoride 0.5 mg]; 2.2 mg [fluoride 1 mg]

- EtheDent™:
  - 0.55 mg [fluoride 0.25 mg; sugar free; contains aspartame; vanilla flavor]
  - 1.1 mg [fluoride 0.5 mg; sugar free; contains aspartame; grape flavor]
  - 2.2 mg [fluoride 1 mg; sugar free; contains aspartame; cherry flavor]
- Fluor-A-Day:
  - 0.56 mg [fluoride 0.25 mg; raspberry flavor]
  - 1.1 mg [fluoride 0.5 mg; raspberry flavor]
  - 2.21 mg [fluoride 1 mg; raspberry flavor]
- Luride® Lozi-Tab®:
  - 0.55 mg [fluoride 0.25 mg; sugar free; vanilla flavor]
  - 1.1 mg [fluoride 0.5 mg; sugar free; grape flavor]
  - 2.2 mg [fluoride 1 mg; sugar free; cherry flavor] [DSC]
- Pharmaflur®: 2.2 mg [fluoride 1 mg; dye free, sugar free; cherry flavor] [DSC]
- Pharmaflur® 1.1: 1.1 mg [fluoride 0.5 mg; dye free, sugar free; grape flavor] [DSC]

Generic AvailableYes: Excludes lozenge, gel drops

Mechanism of ActionPromotes remineralization of decalcified enamel; inhibits the cariogenic microbial process in dental plaque; increases tooth resistance to acid dissolution

Pharmacodynamics/Kinetics

Absorption: Oral: Rapid and complete; sodium fluoride; other soluble fluoride salts; calcium, iron, or magnesium may delay absorption

Distribution: 50% of fluoride is deposited in teeth and bone after ingestion; topical application works superficially on enamel and plaque; crosses placenta; enters breast milk

Excretion: Urine and feces

Dental Health Professional ConsiderationsNeutral pH fluoride preparations are preferred in patients with oral mucositis to reduce tissue irritation; long-term use of acidulated fluorides has been associated with enamel demineralization and damage to porcelain crowns

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Products containing stannous fluoride may stain teeth. See Dental Comment.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsAcidulated Phosphate Fluoride; Sodium Fluoride; Stannous Fluoride

Medication Safety Issues

International issues:

Flarex® may be confused with Flurets® which is a brand name for sodium fluoride in Australia

Flarex® may be confused with Fluarix® which is a brand name for influenza virus vaccine in the U.S. and in numerous international markets

Flarex® may be confused with Fluorex® which is a brand name for sodium fluoride in France

Fluor-Op® may be confused with Fluoron® which is a brand name for fluorine in Canada

Pronunciation(flure oh METH oh lone)

U.S. Brand NamesFlarex®; FML®; FML® Forte

Canadian Brand NamesFlarex®; FML Forte®; FML®; PMS-Fluorometholone

Pharmacologic CategoryCorticosteroid, Ophthalmic

Use: Labeled IndicationsTreatment of steroid-responsive inflammatory conditions of the eye

Dosing: AdultsOcular inflammation: Ophthalmic:

Ointment (FML®): Apply small amount (~$^{1}/_{2}$ inch ribbon) to conjunctival sac 1-3 times/day; may increase application to every 4 hours during the initial 24-48 hours

Suspension:

FML®: Instill 1 drop into conjunctival sac 2-4 times/day; may instill 1 drop every 4 hours during initial 24-48 hours

FML® Forte: Instill 1 drop into conjunctival sac 2-4 times/day

Flarex®: Instill 1-2 drops into conjunctival sac 4 times/day; may increase application to 2 drops every 2 hours during initial 24-48 hours. Consult prescriber if no improvement after 14 days.

Note: Re-evaluate therapy if improvement is not seen within 2 days; use care not to discontinue prematurely; in chronic conditions, gradually decrease dosing frequency prior to discontinuing treatment.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricChildren >2 years: Refer to adult dosing.

Administration: OtherContact lenses should be removed before instillation. Shake suspension well before use.

Storage

Suspension:

Flarex®, FML®: Store at room temperature of 2°C to 25°C (36°F to 77°F); do not freeze.

FML® Forte: Store at ≤25°C (77°F); do not freeze.

Ointment: FML®: Store at ≤25°C (77°F).

ContraindicationsHypersensitivity to fluorometholone or any component of the formulation; viral diseases of the cornea and conjunctiva (including epithelial herpes simplex keratitis, vaccinia, and varicella); mycobacterial or fungal infections of the eye; untreated eye infections which may be masked/enhanced by a steroid

Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Exacerbation of viral infections: May exacerbate severity of viral infections. Use caution in patients with history of herpes simplex. Re-evaluate after 2 days if symptoms have not improved.
- Ocular effects: Prolonged use may result in glaucoma and injury to the optic nerve and lead to or mask secondary ocular infections (eg, bacterial, viral, fungal). Visual defects in acuity and field of vision may occur. Posterior subcapsular cataracts may form after long-term use. Use with caution in presence of glaucoma (steroids increase intraocular pressure). Perforation may occur with topical steroids in diseases which thin the cornea or sclera. Steroid use may delay healing after cataract surgery. Intraocular pressure should be monitored if this product is used >10 days.

Special populations:

- Contact lens wearers: Some products contain benzalkonium chloride which may be adsorbed by contact lenses; remove contacts prior to administration and wait 15 minutes before reinserting.

- Pediatrics: Safety and efficacy have not been established in children <2 years of age.

Pregnancy Risk FactorC
Pregnancy ConsiderationsThe extent of systemic absorption is not known. Use with caution in pregnant women.
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsFrequency not defined.

Gastrointestinal: Taste perversion

Ocular: Anterior uveitis, bleb formation increased, blurred vision, burning, cataract formation, conjunctival hyperemia, conjunctivitis, corneal ulcers, delayed wound healing, glaucoma, glaucoma with optic nerve damage, intraocular pressure increased, irritation, keratitis, mydriasis, perforation of the globe, ptosis, secondary ocular infection (bacterial, fungal, viral), stinging, visual acuity and field defects

Miscellaneous: Allergic reaction, systemic hypercorticoidism (rare)

Drug Interactions

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

Monitoring ParametersIntraocular pressure in patients with glaucoma or when used for ≥10 days; presence of secondary infections (including the development of fungal infections and exacerbation of viral infections)
Nursing: Physical Assessment/MonitoringMonitor intraocular pressure in patients with glaucoma or when used for ≥10 days; monitor for presence of secondary infections (including the development of fungal infections and exacerbation of viral infections). Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.
Patient EducationFor ophthalmic use only. Apply prescribed amount as often as directed. Wash hands before using. Wipe away excess from skin around eye. Do not use any other eye preparation for at least 10 minutes. Do not touch tip of applicator to eye or any other surface. Do not share medication with anyone else. May cause sensitivity to bright light (dark glasses may help); temporary stinging or blurred vision may occur. Do not wear contacts during administration and for 15 minutes after. Inform prescriber if you experience eye pain, redness, burning, watering, dryness, double vision, puffiness around eye, vision changes, or other adverse eye response; worsening of condition or lack of improvement. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Consult prescriber if breast-feeding.

Ointment: Gently squeeze the tube to apply to inside of lower lid. Close eye for 1-2 minutes and roll eyeball in all directions.

Suspension: Shake well before using. Tilt head back and look upward. Gently pull down lower lid and put drop(s) in inner corner of eye. Close eye and roll eyeball in all directions. Do not blink for 30 seconds. Apply gentle pressure to inner corner of eye for 30 seconds.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Ointment, ophthalmic, as base:

FML®: 0.1% (3.5 g)

Suspension, ophthalmic, as base: 0.1% (5 mL, 10 mL, 15 mL)

FML®: 0.1% (5 mL, 10 mL, 15 mL) [contains benzalkonium chloride]

FML® Forte: 0.25% (2 mL, 5 mL, 10 mL, 15 mL) [contains benzalkonium chloride]

Suspension, ophthalmic, as acetate:

Flarex®: 0.1% (5 mL) [contains benzalkonium chloride]

Generic AvailableYes: Suspension (as base)

0.1% (15): $70.99

Mechanism of Action Decreases inflammation by suppression of migration of polymorphonuclear leukocytes and reversal of increased capillary permeability

Pharmacodynamics/Kinetics Absorption: Into aqueous humor with slight systemic absorption

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status None reported

Mental Health: Effects on Psychiatric Treatment None reported

Pharmacologic Category[Chemotherapy Regimen, Head and Neck Cancer]

Regimen UseHead and neck cancer

RegimenNOTE: Multiple variations are listed below.

Variation 1:

Fluorouracil: I.V.: 600 mg/m^2/day continuous infusion days 1 to 4

[total dose/cycle = 2400 mg/m^2]

Carboplatin: I.V.: 70 mg/m^2/day days 1 to 4

[total dose/cycle = 280 mg/m^2]

Repeat cycle every 3 weeks for 3 cycles

Variation 2:

Carboplatin: I.V.: 400 mg/m^2 day 1

[total dose/cycle = 400 mg/m^2]

Fluorouracil: I.V.: 1000 mg/m^2/day continuous infusion days 1 to 4

[total dose/cycle = 4000 mg/m^2]

Repeat cycle every 28 days

Variation 1 (Mayo Regimen):

Fluorouracil: I.V.: 425 mg/m^2/day days 1 to 5

[total dose/cycle = 2125 mg/m^2]

Leucovorin: I.V.: 20 mg/m^2/day days 1 to 5

[total dose/cycle = 100 mg/m^2]

Repeat cycle every 28 days

Variation 2:

Fluorouracil: I.V.: 400 mg/m^2/day days 1 to 5

[total dose/cycle = 2000 mg/m^2]

Leucovorin: I.V.: 20 mg/m^2/day days 1 to 5

[total dose/cycle = 100 mg/m^2]

Repeat cycle every 28 days

Variation 3:

Fluorouracil: I.V.: 500 mg/m^2 day 1

[total dose/cycle = 500 mg/m^2]

Leucovorin: I.V.: 20 mg/m^2 (2-hour infusion) day 1

[total dose/cycle = 20 mg/m^2]

or 500 mg/m^2 (2-hour infusion) day 1

[total dose/cycle = 500 mg/m^2]

Repeat cycle weekly

Variation 4:

Fluorouracil: I.V.: 600 mg/m^2 weekly for 6 weeks

[total dose/cycle = 3600 mg/m^2]

Leucovorin: I.V.: 500 mg/m^2 (3-hour infusion) weekly for 6 weeks

[total dose/cycle = 3000 mg/m^2]

Repeat cycle every 8 weeks

Variation 5:

Fluorouracil: I.V.: 600 mg/m^2 weekly for 6 weeks

[total dose/cycle = 3600 mg/m^2]

Leucovorin: I.V.: 500 mg/m^2 weekly for 6 weeks

[total dose/cycle = 3000 mg/m^2]

Repeat cycle every 8 weeks

Variation 6:

Fluorouracil: I.V.: 600 mg/m^2 weekly

[total dose/cycle = 600 mg/m^2]

Leucovorin: I.V.: 500 mg/m^2 (2-hour infusion) weekly

[total dose/cycle = 500 mg/m^2]

Repeat cycle weekly

Variation 7:

Fluorouracil: I.V.: 2600 mg/m^2 continuous infusion day 1

[total dose/cycle = 2600 mg/m^2]

Leucovorin: I.V.: 500 mg/m^2 continuous infusion day 1

[total dose/cycle = 500 mg/m^2]

Repeat cycle weekly

Variation 8:

Fluorouracil: I.V.: 2600 mg/m^2 continuous infusion day 1

[total dose/cycle = 2600 mg/m^2]

Leucovorin: I.V.: 300 mg/m^2 (maximum 500 mg) continuous infusion day 1

[total dose/cycle = 300 mg/m^2; maximum 500 mg]

Repeat cycle weekly

Variation 9:

Fluorouracil: I.V.: 2600 mg/m^2 continuous infusion once weekly for 6 weeks

[total dose/cycle = 15,600 mg/m^2]

Leucovorin: I.V.: 500 mg/m^2 weekly for 6 weeks

[total dose/cycle = 3000 mg/m^2]

Repeat cycle every 8 weeks

Variation 10:

Fluorouracil: I.V.: 2300 mg/m^2 continuous infusion day 1

[total dose/cycle = 2300 mg/m^2]

Leucovorin: I.V.: 50 mg/m^2 continuous infusion day 1

[total dose/cycle = 50 mg/m^2]

Repeat cycle weekly

Variation 11:

Fluorouracil: I.V.: 200 mg/m^2/day continuous infusion days 1 to 14

[total dose/cycle = 2800 mg/m^2]

Leucovorin: I.V.: 5 mg/m^2/day continuous infusion days 1 to 14

[total dose/cycle = 70 mg/m^2]

Repeat cycle every 28 days

Variation 12:

Cycle 1:

Fluorouracil: I.V.: 200 mg/m^2/day continuous infusion for 4 weeks

[total dose/cycle = 5600 mg/m^2]

Leucovorin: I.V.: 20 mg/m^2/day days 1, 8, 15, 22

[total dose/cycle = 80 mg/m^2]

Treatment cycle is 6 weeks

Subsequent cycles (starting week 7):

Fluorouracil: 200 mg/m^2 continuous infusion days 1 to 21

[total dose/cycle = 4200 mg/m^2]

Leucovorin: I.V.: 20 mg/m^2/day days 1, 8, and 15

[total dose/cycle = 60 mg/m^2]

Repeat cycle every 4 weeks

Fluorouracil

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Carac® may be confused with Kuric™

Fluorouracil may be confused with flucytosine

Efudex® may be confused with Efidac (Efidac 24®), Eurax®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

International issues:

Carac® may be confused with Carace® which is a brand name for lisinopril in Ireland and Great Britain

Pronunciation(flure oh YOOR a sil)

U.S. Brand NamesAdrucil®; Carac®; Efudex®; Fluoroplex®; Fluorouracil®

Canadian Brand NamesEfudex®

Pharmacologic CategoryAntineoplastic Agent, Antimetabolite (Pyrimidine Analog)

Use: Labeled IndicationsTreatment of carcinomas of the breast, colon, head and neck, pancreas, rectum, or stomach; topically for the management of actinic or solar keratoses and superficial basal cell carcinomas

Dosing: Adults

Refer to individual protocols.

I.V. bolus: 500-600 mg/m^2 every 3-4 weeks **or**

425 mg/m^2 on days 1-5 every 4 weeks

Continuous I.V. infusion: 1000 mg/m^2/day for 4-5 days every 3-4 weeks **or**

2300-2600 mg/m^2 on day 1 every week **or**

300-400 mg/m^2/day **or**

225 mg/m^2/day for 5-8 weeks (with radiation therapy)

Actinic keratoses: Topical:

Carac™: Apply thin film to lesions once daily for up to 4 weeks, as tolerated

Efudex®: Apply to lesions twice daily for 2-4 weeks; complete healing may not be evident for 1-2 months following treatment

Fluoroplex®: Apply to lesions twice daily for 2-6 weeks

Superficial basal cell carcinoma: Topical: Efudex® 5%: Apply to affected lesions twice daily for 3-6 weeks; treatment may be continued for up to 10-12 weeks

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to adult dosing.

Dosing: Renal ImpairmentThe FDA-approved labeling does not contain specific dosing adjustment guidelines; however, it is stated that extreme caution should be used in patients with renal impairment.

Hemodialysis: Administer dose following hemodialysis.

Aronoff (2007): Recommends that dosage adjustment is not needed in adult patients with Cl_{cr} <50 mL/minute and patients receiving hemodialysis should be administered 50% of dose.

Dosing: Hepatic ImpairmentThe FDA-approved labeling does not contain specific dosing adjustment guidelines; however, it is stated that extreme caution should be used in patients with hepatic impairment. The following guidelines have been used by some clinicians:

Floyd, 2006: Bilirubin >5 mg/dL: Avoid use.

Koren, 1992: Hepatic impairment (degree not specified): Administer <50% of dose, then increase if toxicity does not occur.

Calculations

- Body Surface Area: Adults

Administration: I.V.Irritant. Direct I.V. push injection (50 mg/mL solution needs no further dilution) or by I.V. infusion. Doses >1000 mg/m^2 are usually administered as a 24-hour infusion. Toxicity may be reduced by giving the drug as a constant infusion. Bolus doses may be administered by slow IVP or IVPB.

Administration: I.V. DetailAfter vial has been entered, any unused portion should be discarded within 1 hour. Continuous infusions may be administered in D_5W or NS. Solution should be protected from direct sunlight. Fluorouracil may also be administered intra-arterially or intrahepatically (refer to specific protocols).

pH: 9.2 (adjusted)

Administration: OralI.V. formulation may be given orally mixed in water, grape juice, or carbonated beverage. It is generally best to drink undiluted solution, then rinse the mouth. Coca Cola® has been recommended as the “best chaser” for oral fluorouracil.

Administration: TopicalTopical: Apply 10 minutes after washing, rinsing, and drying the affected area. Apply using fingertip (wash hands immediately after application) or nonmetal applicator. Do not cover area with an occlusive dressing. Wash hands immediately after topical application of the 5% cream. Topical preparations are for external use only; not for ophthalmic, oral, or intravaginal use

Dietary ConsiderationsIncrease dietary intake of thiamine.

Storage

Injection: Store intact vials at room temperature and protect from light; slight discoloration does not usually denote decomposition. If exposed to cold, a precipitate may form; **gentle** heating to 60°C will dissolve the precipitate without impairing the potency. Solutions in 50-1000 mL NS or D_5W, or undiluted solutions in syringes are stable for 72 hours at room temperature.

Topical: Store at controlled room temperature of 15°C to 30°C (59°F to 86°F).

ReconstitutionDilute in 50-1000 mL NS, D_5W, or bacteriostatic NS for infusion.

CompatibilityStable in D_5LR, D_5W, NS, bacteriostatic NS; **incompatible** with concentrations >25 mg/mL of fluorouracil and >2 mg/mL of leucovorin (precipitation occurs).

Y-site administration: Compatible: Allopurinol, amifostine, aztreonam, bleomycin, cefepime, cisplatin, cyclophosphamide, doxorubicin, doxorubicin liposome, etoposide phosphate, fludarabine, furosemide, gatifloxacin, gemcitabine, granisetron, heparin, hydrocortisone sodium succinate, leucovorin, linezolid, mannitol, melphalan, methotrexate, metoclopramide, mitomycin, paclitaxel, piperacillin/tazobactam, potassium chloride, propofol, sargramostim, teniposide, thiotepa, vinblastine, vincristine, vitamin B complex with C. **Incompatible:** Amphotericin B cholesteryl sulfate complex, droperidol, filgrastim, ondansetron, topotecan, vinorelbine.

Compatibility in syringe: Compatible: Bleomycin, cisplatin, cyclophosphamide, furosemide, heparin, leucovorin, methotrexate, metoclopramide, mitomycin, vinblastine, vincristine. **Incompatible:** Droperidol, epirubicin. **Variable (consult detailed reference):** Doxorubicin.

Compatibility when admixed: Compatible: Bleomycin, cyclophosphamide, cyclophosphamide with methotrexate, etoposide, floxuridine, hydromorphone, ifosfamide, methotrexate, mitoxantrone, vincristine. **Incompatible:** Carboplatin, cisplatin, cytarabine, diazepam, doxorubicin, fentanyl, leucovorin, metoclopramide, morphine.

ContraindicationsHypersensitivity to fluorouracil or any component of the formulation; dihydropyrimidine dehydrogenase (DPD) enzyme deficiency; pregnancy

Warnings/Precautions

Boxed warnings:

- Experienced physician: See “Other warnings/precautions” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Hand-foot syndrome: Palmar-plantar erythrodysesthesia (hand-foot) syndrome has been associated with use.
- Toxicity: Discontinue if intractable vomiting, diarrhea, precipitous fall in leukocyte or platelet counts, myocardial ischemia, hemorrhage, or stomatitis occur.

Disease-related concerns:

- Dihydropyrimidine dehydrogenase deficiency (DPD): Administration to patients with genetic DPD has been associated with increased toxicity following administration (diarrhea, neutropenia, and neurotoxicity). Systemic toxicity normally associated with parenteral administration has also been associated with topical use, particularly in patients with DPD; discontinue if symptoms of DPD occur.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Renal impairment: Use with caution in patients with renal impairment.

Concurrent drug therapy issues:

- Alkylating agents: Use with caution in patients who have had previous use of alkylating agents.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.
- Pelvic radiation recipients: Use with caution in patients who have had high-dose pelvic radiation.

Dosage form specific issues:

- Topical: Avoid topical application to mucous membranes due to potential for local inflammation and ulceration. The use of occlusive dressings with topical preparations may increase the severity of inflammation in nearby skin areas. Avoid exposure to ultraviolet rays during and immediately following therapy.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**

Pregnancy Risk FactorD (injection); X (topical)

Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women, however, fetal defects and miscarriages have been reported following use of topical and intravenous products. Use is contraindicated during pregnancy.

LactationExcretion in breast milk unknown/not recommended

Adverse ReactionsToxicity depends on route and duration of treatment

I.V.:

Cardiovascular: Angina, myocardial ischemia, nail changes

Central nervous system: Acute cerebellar syndrome, confusion, disorientation, euphoria, headache, nystagmus

Dermatologic: Alopecia, dermatitis, dry skin, fissuring, palmar-plantar erythrodysesthesia syndrome, pruritic maculopapular rash, photosensitivity, vein pigmentations

Gastrointestinal: Anorexia, bleeding, diarrhea, esophagopharyngitis, nausea, sloughing, stomatitis, ulceration, vomiting

Hematologic: Agranulocytosis, anemia, leukopenia, pancytopenia, thrombocytopenia

Myelosuppression:

Onset: 7-10 days

Nadir: 9-14 days

Recovery: 21-28 days

Local: Thrombophlebitis

Ocular: Lacrimation, lacrimal duct stenosis, photophobia, visual changes

Respiratory: Epistaxis

Miscellaneous: Anaphylaxis, generalized allergic reactions, nail loss

Topical:Note: Systemic toxicity normally associated with parenteral administration (including neutropenia, neurotoxicity, and gastrointestinal toxicity) has been associated with topical use particularly in patients with a genetic deficiency of dihydropyrimidine dehydrogenase

(DPD).

Central nervous system: Headache, insomnia, irritability

Dermatologic: Alopecia, photosensitivity, pruritus, rash, scarring, telangiectasia

Gastrointestinal: Medicinal taste, stomatitis

Hematologic: Leukocytosis, thrombocytopenia

Local: Application site reactions: Allergic contact dermatitis, burning, crusting, dryness, edema, erosion, erythema, hyperpigmentation, irritation, pain, soreness, ulceration

Ocular: Eye irritation (burning, watering, sensitivity, stinging, itching)

Miscellaneous: Birth defects, herpes simplex, miscarriage

Oncology: VesicantNo

Oncology: Emetic PotentialLow (10% to 30%)

Drug Interactions

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Strong) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Gemcitabine: May increase the serum concentration of Fluorouracil. *Risk C: Monitor therapy*

Leucovorin-Levoleucovorin: May enhance the adverse/toxic effect of Fluorouracil. This effect is associated with the ability of leucovorin or levoleucovorin to enhance the anticancer effects of fluorouracil. *Risk C: Monitor therapy*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Phenytoin: Fluorouracil may increase the serum concentration of Phenytoin. *Risk D: Consider therapy modification*

Sorafenib: May decrease the serum concentration of Fluorouracil. Sorafenib may increase the serum concentration of Fluorouracil. *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vitamin K Antagonists (eg, warfarin): Fluorouracil may increase the serum concentration of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Antineoplastic Agents may enhance the anticoagulant effect of Vitamin K Antagonists. Antineoplastic Agents may diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (due to GI irritation).

Herb/Nutraceutical: Avoid black cohosh, dong quai in estrogen-dependent tumors.

Monitoring ParametersCBC with differential and platelet count, renal function tests, liver function tests

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents or herbal products patient may be taking. Assess results of laboratory tests prior to each infusion and regularly with all formulations, including topical use. Assess patient response (eg, cardiovascular, respiratory, and renal function) prior to each infusion and on a regular basis throughout therapy. **Note:** Inform prescriber if intractable vomiting or diarrhea, precipitous fall in leukocyte or platelet counts, or myocardial ischemia occurs (drug may be discontinued). Teach patient proper use (topical application [avoid application to mucous membranes]; oral solution [rinse mouth thoroughly]), possible side effects/appropriate interventions (eg, importance of adequate hydration), and adverse symptoms to report. **Pregnancy risk factor D/X:** Determine that patient is not pregnant before starting therapy. Do not give to females of childbearing age unless patient is capable of complying with contraceptive use. Male/female: Advise patient about contraceptive measures as appropriate.

Monitoring: Lab TestsCBC with differential, platelet count, renal and liver function

Patient EducationDo not take any new medication during therapy without consulting prescriber. Follow exact directions for use (oral solution or topical application). Avoid excessive alcohol (may increase gastrointestinal irritation). Maintain adequate nutrition and hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause sensitivity to sunlight (use sunblock, wear protective clothing, and avoid direct sunlight); susceptibility to infection (avoid crowds and exposure to infection); nausea, vomiting, diarrhea, or loss of appetite (small frequent meals may help; request medication); weakness, lethargy, dizziness, decreased vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or headache (request medication). Report signs and symptoms of infection (eg, fever, chills, sore throat, burning urination, vaginal itching or discharge, fatigue, mouth sores); bleeding (eg, black or tarry stools, easy bruising, unusual bleeding); vision changes; unremitting nausea, vomiting, or abdominal pain; CNS changes; respiratory difficulty; chest pain or palpitations; severe skin reactions to topical application; or any other adverse reactions.

Topical: Use as directed; do not overuse. Wash hands thoroughly before and after applying medication. Avoid contact with eyes, nostrils, and mouth. Avoid occlusive dressings; use a porous dressing. May cause local reaction (pain, burning, or swelling); if severe, contact prescriber.

Oral solution: May be mixed in water, grape juice, or carbonated beverage. It is generally best to drink undiluted solution, then rinse mouth thoroughly. CocaCola® has been recommended as the best rinse following oral fluorouracil.

Pregnancy/breast-feeding precautions: Inform prescriber if you are pregnant. Do not get pregnant during or for 1 month following therapy. Male: Do not cause a pregnancy. Male/female: Consult prescriber for instruction on appropriate contraceptive measures. This drug may cause severe fetal defects. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream, topical:

Carac™: 0.5% (30 g)

Efudex®: 5% (40 g)

Fluoroplex®: 1% (30 g) [contains benzyl alcohol]

Injection, solution: 50 mg/mL (10 mL, 20 mL, 50 mL, 100 mL)

Adrucil®: 50 mg/mL (10 mL, 50 mL, 100 mL)

Solution, topical: 2% (10 mL); 5% (10 mL)

Efudex®: 2% (10 mL); 5% (10 mL)

Fluorouracil®: 5% (10 mL)

Generic AvailableYes: Injection, topical solution

Pricing: U.S. (www.drugstore.com)

Cream (Carac)

0.5% (30): $163.48

Cream (Fluoroplex)

1% (30): $158.72

Solution (Efudex)

2% (10): $87.07

5% (10): $125.83

Solution (Fluorouracil)

5% (10): $101.99

50 mg/mL (50): $25.99

Mechanism of ActionA pyrimidine antimetabolite that interferes with DNA synthesis by blocking the methylation of deoxyuridylic acid; fluorouracil inhibits thymidylate synthetase (TS), or is incorporated into RNA. The reduced folate cofactor is required for tight binding to occur between the 5-FdUMP and TS.

Pharmacodynamics/Kinetics

Duration: ~3 weeks

Distribution: V_d: ~22% of total body water; penetrates extracellular fluid, CSF, and third space fluids (eg, pleural effusions and ascitic fluid)

Metabolism: Hepatic (90%); via a dehydrogenase enzyme; FU must be metabolized to be active

Bioavailability: <75%, erratic and undependable

Half-life elimination: Biphasic: Initial: 6-20 minutes; two metabolites, FdUMP and FUTP, have prolonged half-lives depending on the type of tissue

Excretion: Lung (large amounts as CO_2); urine (5% as unchanged drug) in 6 hours

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Stomatitis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness

Mental Health: Effects on Psychiatric TreatmentMyelosuppression is common; use caution with clozapine and carbamazepine

Index Terms5-Fluorouracil; 5-FU; FU

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

FLUoxetine may be confused with DULoxetine, fluvastatin, fluvoxamine, PARoxetine

Prozac® may be confused with Prilosec®, Prograf®, Proscar®, ProSom®, ProStep®

Sarafem® may be confused with Serophene®

International issues:

Fluoxin® [Czech Republic and Romania] may be confused with Floxin® which is a brand name for ofloxacin in the U.S.

Prozac® may be confused with Prazac® a brand of prazosin in Denmark

Reneuron® [Spain] may be confused with Remeron® a brand of mirtazapine in the U.S.

Pronunciation(floo OKS e teen)

U.S. Brand NamesProzac®; Prozac® Weekly™; Sarafem®; Selfemra™

Canadian Brand NamesApo-Fluoxetine®; BCI-Fluoxetine; CO Fluoxetine; Dom-Fluoxetine; Fluoxetine; FXT; Gen-Fluoxetine; Novo-Fluoxetine; Nu-Fluoxetine; PHL-Fluoxetine; PMS-Fluoxetine; Prozac®; ratio-Fluoxetine; Rhoxal-Fluoxetine; Riva-Fluoxetine; Sandoz-Fluoxetine

Pharmacologic CategoryAntidepressant, Selective Serotonin Reuptake Inhibitor

Use: Labeled IndicationsTreatment of major depressive disorder (MDD); treatment of binge-eating and vomiting in patients with moderate-to-severe bulimia nervosa; obsessive-compulsive disorder (OCD); premenstrual dysphoric disorder (PMDD); panic disorder with or without agoraphobia

Use: Unlabeled/InvestigationalSelective mutism; treatment of mild dementia-associated agitation in nonpsychotic patients

Dosing: Adults

Depression, obsessive-compulsive disorder, premenstrual dysphoric disorder, bulimia: 20 mg/day in the morning; may increase after several weeks by 20 mg/day increments; maximum: 80 mg/day; doses >20 mg may be given once daily or divided twice daily. **Note:** Lower doses of 5-10 mg/day have been used for initial treatment.

Usual dosage range:

Depression: 20-40 mg/day; patients maintained on Prozac® 20 mg/day may be changed to Prozac® Weekly™ 90 mg/week, starting dose 7 days after the last 20 mg/day dose

Obsessive compulsive disorder: 40-80 mg/day

Premenstrual dysphoric disorder (Sarafem™): 20 mg/day continuously, **or** 20 mg/day starting 14 days prior to menstruation and through first full day of menses (repeat with each cycle)

Bulimia nervosa: 60-80 mg/day

Panic disorder: Initial: 10 mg/day; after 1 week, increase to 20 mg/day; may increase after several weeks; doses >60 mg/day have not been evaluated

Note: Upon discontinuation of fluoxetine therapy, gradually taper dose. If intolerable symptoms occur following a dose reduction, consider resuming the previously prescribed dose and/or decrease dose at a more gradual rate.

Dosing: ElderlyOral: Some patients may require an initial dose of 10 mg/day with dosage increases of 10 mg and 20 mg every several weeks as tolerated; should not be taken at night unless patient experiences sedation.

Dosing: Pediatric

Depression: Oral: 8-18 years: 10-20 mg/day; lower-weight children can be started at 10 mg/day, may increase to 20 mg/day after 1 week if needed

Obsessive-compulsive disorder: Oral: 7-18 years: Initial: 10 mg/day; in adolescents and higher-weight children, dose may be increased to 20 mg/day after 2 weeks. Range: 10-60 mg/day.

Selective mutism (unlabeled use): Oral:

<5 years: No dosing information available

5-18 years: Initial: 5-10 mg/day; titrate upwards as needed (usual maximum dose: 60 mg/day)

Note: Upon discontinuation of fluoxetine therapy, gradually taper dose. If intolerable symptoms occur following a dose reduction, consider resuming the previously prescribed dose and/or decrease dose at a more gradual rate.

Dosing: Renal Impairment

Single dose studies: Pharmacokinetics of fluoxetine and norfluoxetine were similar among subjects with all levels of impaired renal function, including anephric patients on chronic hemodialysis.

Chronic administration: Additional accumulation of fluoxetine or norfluoxetine may occur in patients with severely impaired renal function.

Not removed by hemodialysis; use of lower dose or less frequent dosing is not usually necessary.

Dosing: Hepatic ImpairmentElimination half-life of fluoxetine is prolonged in patients with hepatic impairment. A lower dose or less frequent dosing of fluoxetine should be used in these patients.
Cirrhosis patient: Administer a lower dose or less frequent dosing interval.

Compensated cirrhosis without ascites: Administer 50% of normal dose.

Dietary ConsiderationsMay be taken with or without food.

StorageAll dosage forms should be stored at controlled room temperature of 15°C to 30°C (50°F to 86°F). Oral liquid should be dispensed in a light-resistant container.

Extemporaneously PreparedA 20 mg capsule may be mixed with 4 oz of water, apple juice, or Gatorade® to provide a solution that is stable for 14 days under refrigeration.

RestrictionsAn FDA-approved medication guide concerning the use of antidepressants in children, adolescents, and young adults must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm. Dispense to parents or guardians of children and adolescents receiving this medication.

ContraindicationsHypersensitivity to fluoxetine or any component of the formulation; patients currently receiving MAO inhibitors, pimozide, or thioridazine

Note: MAO inhibitor therapy must be stopped for 14 days before fluoxetine is initiated. Treatment with MAO inhibitors, thioridazine, or mesoridazine should not be initiated until 5 weeks after the discontinuation of fluoxetine.

Allergy Considerations

- Selective Serotonin Reuptake Inhibitor (SSRI) Allergy

Warnings/Precautions

Boxed Warnings:

- Suicidal thinking/behavior: See "Major psychiatric warnings" below.

Major psychiatric warnings:

- **[U.S. Boxed Warning]: Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 years of age) with major depressive disorder (MDD) and other psychiatric disorders;** consider risk prior to prescribing. Short-term studies did not show an increased risk in patients >24 years of age and showed a decreased risk in patients ≥65 years. Closely monitor patients for clinical worsening, suicidality, or unusual changes in behavior, particularly during the initial 1-2 months of therapy or during periods of dosage adjustments (increases or decreases); the patient's family or caregiver should be instructed to closely observe the patient and communicate condition with healthcare provider. A medication guide concerning the use of antidepressants should be dispensed with each prescription. **Fluoxetine is FDA approved for the treatment of OCD in children ≥7 years of age and MDD in children ≥8 years of age.**

- The possibility of a suicide attempt is inherent in major depression and may persist until remission occurs. Patients treated with antidepressants should be observed for clinical worsening and suicidality, especially during the initial few months of a course of drug therapy, or at times of dose changes, either increases or decreases. Worsening depression and severe abrupt suicidality that are not part of the presenting symptoms may require discontinuation or modification of drug therapy. Use caution in high-risk patients during initiation of therapy.

- Prescriptions should be written for the smallest quantity consistent with good patient care. The patient's family or caregiver should be alerted to monitor patients for the emergence of suicidality and associated behaviors such as anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, and mania; patients should be instructed to notify their healthcare provider if any of these symptoms or worsening depression or psychosis occur.

- May worsen psychosis in some patients or precipitate a shift to mania or hypomania in patients with bipolar disorder. Monotherapy in patients with bipolar disorder should be avoided. Patients presenting with depressive symptoms should be screened for bipolar disorder. **Fluoxetine is not FDA approved for the treatment of bipolar depression.** Safety and efficacy in children <8 years of age (major depressive disorder) and <7 years of age (OCD) have not been established.

Concerns related to adverse effects:

- Allergic events and rash: Fluoxetine use has been associated with occurrences of significant rash and allergic events, including vasculitis, lupus-like syndrome, laryngospasm, anaphylactoid reactions, and pulmonary inflammatory disease. Discontinue if underlying cause of rash cannot be identified.

- Anticholinergic effects: Relatively devoid of these side effects

- Bleeding risk: May impair platelet aggregation resulting in increased risk of bleeding events, particularly if used concomitantly with aspirin, NSAIDs, warfarin or other anticoagulants. Bleeding related to SSRI use has been reported to range from relatively minor bruising and epistaxis to life-threatening hemorrhage.

- CNS depression: Has a low potential to impair cognitive or motor performance; caution operating hazardous machinery or driving.

- CNS effects: May cause insomnia, anxiety, nervousness, or anorexia.

- Sexual dysfunction: May cause or exacerbate sexual dysfunction.

- SIADH and hyponatremia: SSRIs and SNRIs have been associated with the development of SIADH; hyponatremia has been reported rarely (including severe cases with serum sodium <110 mmol/L), predominately in the elderly. Volume depletion and/or concurrent use of diuretics likely increases risk.

- Weight loss: May cause weight loss. Use caution in patients where weight loss is undesirable.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with a history of MI or unstable heart disease; use in these patients is limited.

- Diabetes: Use with caution in patients with diabetes mellitus; may alter glycemic control.

- Hepatic impairment: Use with caution in patients with hepatic impairment; clearance is decreased and plasma concentrations are increased; a lower dosage may be needed.

- Renal impairment: Use with caution in patients with renal impairment; clearance is decreased and plasma concentrations are increased; a lower dosage may be needed.

- Seizure disorders: Use with caution in patients with a previous seizure disorder or conditions predisposing to seizures such as brain damage or alcoholism.

Concurrent drug therapy issues:

- Agents which lower seizure threshold: Use caution with concurrent therapy.

- Anticoagulants/Antiplatelets: Use caution with concomitant use of NSAIDs, ASA, or other drugs that affect coagulation; the risk of bleeding may be potentiated.

- CNS depressants: Use caution with concomitant therapy.

- MAO inhibitors: Potential for severe reaction when used with MAO inhibitors; autonomic instability, coma, death, delirium, diaphoresis, hyperthermia, mental status changes/agitation, muscular rigidity, myoclonus, neuroleptic malignant syndrome features, and seizures may occur.

- Serotonin syndrome: Symptoms of agitation, confusion, hallucinations, hyper-reflexia, myoclonus, shivering, and tachycardia may occur with concomitant proserotonergic drugs (ie, SSRIs/SNRIs or triptans) or agents which reduce fluoxetine's metabolism. Concurrent use of serotonin precursors (eg, tryptophan) is not recommended.

- Thioridazine: Fluoxetine may elevate plasma levels of thioridazine; increasing risk of QTc interval prolongation; this may lead to serious ventricular arrhythmias, such as torsade de pointes-type arrhythmias, and sudden death. **Concurrent use is contraindicated.**

Special populations:

- Elderly: Use caution in elderly patients; risk of hyponatremia and other adverse events may be increased.

Other warnings/precautions:

- Electroconvulsive therapy: May increase the risks associated with electroconvulsive therapy; consider discontinuing, when possible, prior to ECT treatment.

- Long half-life: Due to the long half-life of fluoxetine and its metabolites, the effects and interactions noted may persist for prolonged periods following discontinuation.

- Withdrawal syndrome: May cause dysphoric mood, irritability, agitation, dizziness, sensory disturbances, anxiety, confusion, headache, lethargy, emotional lability, insomnia, hypomania, tinnitus, and seizures. Upon discontinuation of fluoxetine therapy, gradually taper dose. If intolerable symptoms occur following a decrease in dosage or upon discontinuation of therapy, then resuming the previous dose with a more gradual taper should be considered.

Geriatric ConsiderationsFluoxetine's favorable side effect profile makes it a useful alternative to the traditional tricyclic antidepressants. Its potential stimulating and anorexic effects may be bothersome to some patients and has not been shown to be superior in efficacy to the traditional tricyclic antidepressants or other SSRIs. The long half-life in the elderly makes it less attractive compared to other SSRIs. Data from a clinical trial comparing fluoxetine to tricyclics suggest that fluoxetine is significantly less effective than nortriptyline in hospitalized elderly patients with unipolar major affective disorder, especially those with melancholia and concurrent cardiovascular diseases. The elderly are more prone to SSRI/SNRI-induced hyponatremia.

Pregnancy Risk FactorC

Pregnancy ConsiderationsDue to adverse effects observed in animal studies, fluoxetine is classified as pregnancy category C. Fluoxetine and its metabolite cross the human placenta. Nonteratogenic effects in the newborn following SSRIs exposure late in the third trimester include respiratory distress, cyanosis, apnea, seizures, temperature instability, feeding difficulty, vomiting, hypoglycemia, hypo- or hypertonia, hyper-reflexia, jitteriness, irritability, constant crying, and tremor. An increased risk of low birth weight, lower APGAR scores, and blunted behavioral response to pain for a prolonged period after delivery have also been reported. Exposure to SSRIs after the twentieth week of gestation has been associated with persistent pulmonary hypertension of the newborn (PPHN). Adverse effects may be due to toxic effects of the SSRI or drug withdrawal without a taper. The long term effects of *in utero* SSRI exposure on infant development and behavior are not known.

Due to pregnancy-induced physiologic changes, women who are pregnant may require increased doses of fluoxetine to achieve euthymia.

Women treated for major depression and who are euthymic prior to pregnancy are more likely to experience a relapse when medication is discontinued as compared to pregnant women who continue taking antidepressant medications. The ACOG recommends that therapy with SSRIs or SNRIs during pregnancy be individualized; treatment of depression during pregnancy should incorporate the clinical expertise of the mental health clinician, obstetrician, primary healthcare provider, and pediatrician. If treatment during pregnancy is required, consider tapering therapy during the third trimester in order to prevent withdrawal symptoms in the infant. If this is done and the woman is considered to be at risk of relapse from her major depressive disorder, the medication can be restarted following delivery, although the dose should be readjusted to that required before pregnancy.

LactationEnters breast milk/not recommended (AAP rates “of concern”)

Breast-Feeding ConsiderationsFluoxetine and its metabolite are excreted into breast milk and can be detected in the serum of breast-feeding infants. Concentrations in breast milk are variable. Colic, irritability, slow weight gain, and feeding and sleep disorders have been reported in nursing infants. The AAP considers fluoxetine to be a "drug for which the effect on the nursing infant is unknown but may be of concern." Breast-feeding is not recommended by the manufacturer.

Because the long-term effects on development and behavior have not been studied and adverse effects have been noted in some infants exposed, one should prescribe fluoxetine to a mother who is breast-feeding only when the benefits outweigh the potential risks.

Pregnancy & Lactation, In-Depth

- FLUoxetine

Adverse ReactionsPercentages listed for adverse effects as reported in placebo-controlled trials and were generally similar in adults and children; actual frequency may be dependent upon diagnosis and in some cases the range presented may be lower than or equal to placebo for a particular disorder.

>10%:

Central nervous system: Insomnia (10% to 33%), headache (21%), anxiety (6% to 15%), nervousness (8% to 14%), somnolence (5% to 17%)

Endocrine & metabolic: Libido decreased (1% to 11%)

Gastrointestinal: Nausea (12% to 29%), diarrhea (8% to 18%), anorexia (4% to 11%), xerostomia (4% to 12%)

Neuromuscular & skeletal: Weakness (7% to 21%), tremor (3% to 13%)

Respiratory: Pharyngitis (3% to 11%), yawn (<1% to 11%)

1% to 10%:

Cardiovascular: Vasodilation (1% to 5%), fever (2%), chest pain, hemorrhage, hypertension, palpitation

Central nervous system: Dizziness (9%), dream abnormality (1% to 5%), thinking abnormality (2%), agitation, amnesia, chills, confusion, emotional lability, sleep disorder

Dermatologic: Rash (2% to 6%), pruritus (4%)

Endocrine & metabolic: Ejaculation abnormal (<1% to 7%), impotence (<1% to 7%)

Gastrointestinal: Dyspepsia (6% to 10%), constipation (5%), flatulence (3%), vomiting (3%), weight loss (2%), appetite increased, taste perversion, weight gain

Genitourinary: Urinary frequency

Ocular: Vision abnormal (2%)

Otic: Ear pain, tinnitus

Respiratory: Sinusitis (1% to 6%)

Miscellaneous: Flu-like syndrome (3% to 10%), diaphoresis (2% to 8%)

<1%, postmarketing and/or case reports: Acne, albuminuria, allergies, alopecia, amenorrhea, anaphylactoid reactions, anemia, angina, aphthous stomatitis, arrhythmia, arthritis, asthma, bone pain, bruising, bursitis, cataract, CHF, cholelithiasis, cholestatic jaundice, colitis, dehydration, dyskinesia, dysphagia, ecchymosis, edema, eosinophilic pneumonia, epistaxis, erythema multiforme, erythema nodosum, esophagitis, euphoria, exfoliative dermatitis, extrapyramidal symptoms (rare), gastritis, glossitis, gout, gynecomastia, hallucinations, hepatic failure/necrosis, hemorrhage, hiccup, hostility, hypercholesteremia, hyperprolactinemia, hyperventilation, hypoglycemia, hypokalemia, hyponatremia (possibly in association with SIADH), hypotension, hypothyroidism, immune-related hemolytic anemia, kidney failure, laryngospasm, leg cramps, liver function test abnormalities, lupus-like syndrome, malaise, migraine, misuse/abuse, MI, neuroleptic malignant syndrome (NMS), optic neuritis, pancreatitis, pancytopenia, photosensitivity reaction, postural hypotension, priapism, pulmonary embolism, pulmonary fibrosis, pulmonary hypertension, QT prolongation, serotonin syndrome, Stevens-Johnson syndrome, suicidal ideation, syncope, tachycardia, tinnitus, thrombocytopenia, thrombocytopenic purpura, vasculitis, ventricular tachycardia (including torsade de pointes)

Metabolism/Transport Effects**Substrate** of CYP1A2 (minor), 2B6 (minor), 2C9 (major), 2C19 (minor), 2D6 (major), 2E1 (minor), 3A4 (minor); **Inhibits** CYP1A2 (moderate), 2B6 (weak), 2C9 (weak), 2C19 (moderate), 2D6 (strong), 3A4 (weak)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Alpha-/Beta-Blockers: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Alpha-/Beta-Blockers. *Risk C: Monitor therapy*

Analgesics (Opioid): May enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Anticoagulants: Antiplatelet Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Serotonin Reuptake Inhibitor/Antagonist): Selective Serotonin Reuptake Inhibitors may enhance the serotonergic effect of Antidepressants (Serotonin Reuptake Inhibitor/Antagonist). This may cause serotonin syndrome. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the anticoagulant effect of other Antiplatelet Agents. *Risk C: Monitor therapy*

Aspirin: Selective Serotonin Reuptake Inhibitors may enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Benzodiazepines (metabolized by oxidation): Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Beta-Blockers: Selective Serotonin Reuptake Inhibitors may enhance the bradycardic effect of Beta-Blockers. **Exceptions:** Acebutolol; Atenolol; Carteolol; Esmolol; Levobunolol; Metipranolol; Nadolol; Penbutolol. *Risk C: Monitor therapy*

BusPIRone: May enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. Selective Serotonin Reuptake Inhibitors may decrease the metabolism of BusPIRone. *Risk C: Monitor therapy*

CarBAMazepine: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of CarBAMazepine. Specifically those SSRIs that inhibit CYP3A4 isoenzymes. CarBAMazepine may increase the metabolism of Selective Serotonin Reuptake Inhibitors. Specifically those agents metabolized via CYP1A2, 2C, and/or 3A4 isoenzymes. *Risk D: Consider therapy modification*

Cimetidine: May decrease the metabolism of Selective Serotonin Reuptake Inhibitors. *Risk D: Consider therapy modification*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Clozapine: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Clozapine. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP1A2 Substrates: CYP1A2 Inhibitors (Moderate) may decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP2C19 Substrates: CYP2C19 Inhibitors (Moderate) may decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C9 Inducers (Highly Effective): May increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Moderate): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Strong): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

CYP2D6 Substrates: CYP2D6 Inhibitors (Strong) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk D: Consider therapy modification*

Cyproheptadine: May diminish the therapeutic effect of Selective Serotonin Reuptake Inhibitors. *Risk C: Monitor therapy*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Dasatinib: May enhance the anticoagulant effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Desmopressin: Selective Serotonin Reuptake Inhibitors may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Dextromethorphan: Selective Serotonin Reuptake Inhibitors may enhance the adverse/toxic effect of Dextromethorphan. *Risk D: Consider therapy modification*

Drotrecogin Alfa: Antiplatelet Agents may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Galantamine: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Galantamine. *Risk C: Monitor therapy*

Haloperidol: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Haloperidol. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Antiplatelet Agents. Bleeding may occur. *Risk D: Consider therapy modification*

Ibritumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to impaired platelet function and an increased risk of bleeding. *Risk C: Monitor therapy*

Iobenguane I 123: Selective Serotonin Reuptake Inhibitors may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Lithium: Selective Serotonin Reuptake Inhibitors may enhance the adverse/toxic effect of Lithium. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Selective Serotonin Reuptake Inhibitors. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk X: Avoid combination*

Methadone: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Methadone. Fluvoxamine appears to be the only interacting SSRI. *Risk D: Consider therapy modification*

Mexiletine: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Mexiletine. *Risk D: Consider therapy modification*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

NSAID (COX-2 Inhibitor): Selective Serotonin Reuptake Inhibitors may enhance the antiplatelet effect of NSAID (COX-2 Inhibitor). *Risk D: Consider therapy modification*

NSAID (Nonselective): Selective Serotonin Reuptake Inhibitors may enhance the antiplatelet effect of NSAID (Nonselective). *Risk D: Consider therapy modification*

Omega-3-Acid Ethyl Esters: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the adverse/toxic effect of Antiplatelet Agents. Specifically, the risk of bleeding may be increased by concurrent use of these agents. *Risk C: Monitor therapy*

Phenytoin: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Phenytoin. *Risk D: Consider therapy modification*

Pimozide: Selective Serotonin Reuptake Inhibitors may enhance the adverse/toxic effect of Pimozide. *Risk X: Avoid combination*

Propafenone: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Propafenone. *Risk D: Consider therapy modification*

Prostacyclin Analogues: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

QuiNIDine: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of QuiNIDine. Fluvoxamine appears to be the only SSRI of concern. *Risk D: Consider therapy modification*

Risperidone: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Risperidone. *Risk C: Monitor therapy*

Salicylates: Antiplatelet Agents may enhance the adverse/toxic effect of Salicylates. Increased risk of bleeding may result. *Risk C: Monitor therapy*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Tamoxifen: CYP2D6 Inhibitors (Strong) may decrease the metabolism of Tamoxifen. Specifically, strong CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk X: Avoid combination*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Tetrabenazine: CYP2D6 Inhibitors (Strong) may increase the serum concentration of Tetrabenazine. Specifically, concentrations of the active alpha- and beta-dihydrotetrabenazine metabolites may be increased. Management: Tetrabenazine dose should be reduced by 50% when starting a strong CYP2D6 inhibitor. Maximum tetrabenazine dose is 50mg/day when used with a strong CYP2D6 inhibitor. *Risk D: Consider therapy modification*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Thioridazine: CYP2D6 Inhibitors may decrease the metabolism of Thioridazine. *Risk X: Avoid combination*

Thrombolytic Agents: Antiplatelet Agents may enhance the anticoagulant effect of Thrombolytic Agents. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse events may be increased. *Risk C: Monitor therapy*

TraMADol: Selective Serotonin Reuptake Inhibitors may enhance the neuroexcitatory and/or seizure-potentiating effect of TraMADol. TraMADol may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk D: Consider therapy modification*

Tricyclic Antidepressants: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Tryptophan: May enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Selective Serotonin Reuptake Inhibitors may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression). Depressed patients should avoid/limit intake.

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Monitoring ParametersMental status for depression, suicidal ideation (especially at the beginning of therapy or when doses are increased or decreased), anxiety, social functioning, mania, panic attacks; akathisia, sleep
Reference RangeTherapeutic levels have not been well established

Therapeutic: Fluoxetine: 100-800 ng/mL (SI: 289-2314 nmol/L); Norfluoxetine: 100-600 ng/mL (SI: 289-1735 nmol/L)

Toxic: Fluoxetine plus norfluoxetine: >2000 ng/mL

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions at beginning of therapy and periodically with long-term use. Taper dosage slowly when discontinuing. Assess mental status for depression, suicidal ideation, anxiety, social functioning, mania, or panic attack. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.
Monitoring: Lab TestsBaseline liver and renal function before beginning drug therapy
Patient EducationTake exactly as directed; do not increase dose or frequency. It may take 2-3 weeks to achieve desired results. Take once-a-day dose in the morning to reduce incidence of insomnia. Avoid alcohol, caffeine, and other prescription or OTC medications not approved by prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, lightheadedness, impaired coordination, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); constipation (increased exercise, fluids, fruit, or fiber may help); anorexia (maintain regular dietary intake to avoid excessive weight loss); or postural hypotension (use caution when climbing stairs or changing position from lying or sitting to standing). If you have diabetes, monitor serum glucose closely (may cause hypoglycemia). Report persistent CNS effects (nervousness, restlessness, insomnia, anxiety, excitation, suicide ideation, headache, sedation); thoughts of suicide; rash or skin irritation; muscle cramping, tremors, or change in gait; respiratory depression or respiratory difficulty; or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Breast-feeding is not recommended.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. **Note:** Strength expressed as base unless otherwise noted. [DSC] = Discontinued product

Capsule: 10 mg, 20 mg, 40 mg

Prozac®: 10 mg, 20 mg, 40 mg

Sarafem®: 10 mg, 20 mg [DSC]

Selfemra™: 10 mg, 20 mg [contains soya lecithin]

Capsule, delayed release, enteric coated pellets:

Prozac® Weekly™: 90 mg

Solution, oral: 20 mg/5 mL (5 mL, 120 mL) [contains ethanol 0.23% and benzoic acid; mint flavor]

Prozac®: 20 mg/5 mL (120 mL) [contains ethanol 0.23% and benzoic acid; mint flavor]

Tablet: 10 mg, 20 mg

Prozac® [scored]: 10 mg [DSC]

Sarafem®: 10 mg, 20 mg

Generic AvailableYes: Excludes delayed release capsule
ManufacturerEli Lilly and Co
Pricing: U.S. (www.drugstore.com)

Capsule, delayed release (Prozac Weekly)

90 mg (4): $121.81

Capsules (Fluoxetine HCl)

10 mg (30): $24.99

20 mg (30): $14.99

40 mg (30): $40.99

Capsules (Prozac)

10 mg (30): $166.26

20 mg (30): $151.93

40 mg (30): $325.23

Capsules (Selfemra)

10 mg (28): $25.00

20 mg (28): $27.99

Solution (Fluoxetine HCl)

20 mg/5 mL (120): $72.98

Solution (Prozac)

20 mg/5 mL (120): $252.64

Tablets (Fluoxetine HCl)

10 mg (30): $13.99

20 mg (30): $25.99

Tablets (Prozac)

10 mg (30): $122.17

Tablets (Sarafem)

10 mg (7): $49.99

20 mg (7): $49.99

Mechanism of ActionInhibits CNS neuron serotonin reuptake; minimal or no effect on reuptake of norepinephrine or dopamine; does not significantly bind to alpha-adrenergic, histamine, or cholinergic receptors

Pharmacodynamics/Kinetics

Onset of action: Depression: The onset of action is within a week, however, individual response varies greatly and full response may not be seen until 8-12 weeks after initiation of treatment.

Absorption: Well absorbed; delayed 1-2 hours with weekly formulation

Distribution: V_d: 12-43 L/kg

Protein binding: 95% to albumin and alpha$_1$ glycoprotein

Metabolism: Hepatic, via CYP2C19 and 2D6, to norfluoxetine (activity equal to fluoxetine)

Half-life elimination: Adults:

Parent drug: 1-3 days (acute), 4-6 days (chronic), 7.6 days (cirrhosis)

Metabolite (norfluoxetine): 9.3 days (range: 4-16 days), 12 days (cirrhosis)

Time to peak, serum: 6-8 hours

Excretion: Urine (10% as norfluoxetine, 2.5% to 5% as fluoxetine)

Note: Weekly formulation results in greater fluctuations between peak and trough concentrations of fluoxetine and norfluoxetine compared to once-daily dosing (24% daily/164% weekly; 17% daily/43% weekly, respectively). Trough concentrations are 76% lower for fluoxetine and 47% lower for norfluoxetine than the concentrations maintained by 20 mg once-daily dosing. Steady-state fluoxetine concentrations are ~50% lower following the once-weekly regimen compared to 20 mg once daily. Average steady-state concentrations of once-daily dosing were highest in children ages 6 to <13 (fluoxetine 171 ng/mL; norfluoxetine 195 ng/mL), followed by adolescents ages 13 to <18 (fluoxetine 86 ng/mL; norfluoxetine 113 ng/mL); concentrations were considered to be within the ranges reported in adults (fluoxetine 91-302 ng/mL; norfluoxetine 72-258 ng/mL).

Pharmacotherapy PearlsECG may reveal S-T segment depression. Not shown to be teratogenic in rodents; 15-60 mg/day, buspirone and cyproheptadine, may be useful in treatment of sexual dysfunction during treatment with a selective serotonin reuptake inhibitor.

Weekly capsules are a delayed release formulation containing enteric-coated pellets of fluoxetine hydrochloride, equivalent to 90 mg fluoxetine. Therapeutic equivalence of weekly formulation with daily formulation for delaying time to relapse has not been established.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation) and taste perversion. Problems with SSRI-induced bruxism have been reported and may preclude their use. Clinicians attempting to evaluate any patient with bruxism or involuntary muscle movement, who is simultaneously being treated with an SSRI drug, should be aware of this potential association.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsAlthough caution should be used in patients taking tricyclic antidepressants, no interactions have been reported with vasoconstrictors and fluoxetine, a nontricyclic antidepressant which acts to increase serotonin; no precautions appear to be needed. Fluoxetine is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution.

Mental Health: Child/Adolescent ConsiderationsA study in children 8-15 years of age with obsessive compulsive disorder (n=14) used a fixed dose of 20 mg/day (Riddle, 1992). A study of children 10-18 years of age with obsessive compulsive symptoms and Tourette's syndrome (n=5) used 20-40 mg/day (Kurlan, 1993). Six children 6-12 years of age with selective mutism were treated with initial doses of 0.2 mg/kg/day for 1 week, then 0.4 mg/kg/day for 1 week, then 0.6 mg/kg/day for 10 weeks (Black, 1994). Twenty-one children (mean age: 8.2 years) with selective mutism received a mean end dose of 28.1 mg (10-60 mg) in a 9 week open trial (Dummit, 1996). Ninety-six outpatients 7-17 years of age with nonpsychotic major depression received 20 mg/day (Emslie, 1997); further studies are needed.

Numerous studies show a modest effect, at best, for selective serotonin reuptake inhibitors in the treatment of pediatric depression. However, data from these studies has suggested that fluoxetine may be more effective than other SSRIs, particularly in adolescents (Hetrick, 2007; Tsapakis, 2008; Usala, 2008). However, concerns remain for the risk of increased suicidal thinking/behaviors in children and adolescents.

Mental Health CommentThe SSRIs as a class are generally considered to be safe and equally effective. Allow sufficient dose-response time (6-12 weeks). Differences lie in approved indications, receptor profiles, pharmacokinetics, and cytochrome P450 activity profile. Subtle differences exist in adverse effect profiles. All SSRIs have the potential to cause sexual dysfunction. Among the SSRIs, fluoxetine is felt to be the most activating. The once-weekly dosing formulation may be appropriate for psychiatric populations that are noncompliant with daily administration.

Cardiovascular ConsiderationsSSRIs alone are relatively safe compared to other antidepressants in patients with cardiovascular disease. SSRIs may increase the risk of QT prolongation/torsade de pointes associated with other drugs administered concurrently. Fluoxetine is being evaluated in experimental studies for vasovagal syncope. Fluoxetine may decrease the metabolism of thioridazine possibly predisposing to thioridazine-induced QT interval prolongation. Thioridazine should not be used in combination with fluoxetine and should be dosed at least 5 weeks after fluoxetine is discontinued.

Anesthesia and Critical Care Concerns/Other ConsiderationsSSRIs are relatively safe compared to other antidepressants in patients with cardiovascular disease.

Index TermsFluoxetine Hydrochloride

Fluoxymesterone

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

> Halotestin® may be confused with Haldol®, haloperidol, halothane

Pronunciation(floo oks i MES te rone)

U.S. Brand NamesAndroxy™

Pharmacologic CategoryAndrogen

Use: Labeled IndicationsReplacement of endogenous testicular hormone; in females, palliative treatment of breast cancer

Use: Unlabeled/InvestigationalStimulation of erythropoiesis, angioneurotic edema

Dosing: Adults

Hypogonadism (Males): Oral: 5-20 mg/day

Delayed puberty (Males): Oral: 2.5-20 mg/day for 4-6 months

Inoperable breast carcinoma (Females): Oral: 10-40 mg/day in divided doses for 1-3 months

Dosing: ElderlyRefer to adult dosing.

Dosing: Combination Regimens

Breast cancer: VATH

StorageProtect from light.

RestrictionsC-III

ContraindicationsHypersensitivity to fluoxymesterone or any component of the formulation; serious cardiac disease; liver or kidney disease; pregnancy

Allergy Considerations

- Androgen Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Hepatic effects: Prolonged use and/or high doses may cause peliosis hepatis or liver cell tumors which may not be apparent until liver failure or intra-abdominal hemorrhage develops. Discontinue in case of cholestatic hepatitis with jaundice or abnormal liver function tests.

Disease-related concerns:

- Breast cancer: Use with caution in patients with breast cancer; may cause hypercalcemia by stimulating osteolysis.

- Diabetes: Use with caution in patients with diabetes mellitus; monitor carefully.

- Edematous conditions: Use with caution in patients with conditions influenced by edema (eg, cardiovascular disease, migraine, seizure disorder, renal impairment); may cause fluid retention.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

Special populations:

- Elderly: Use with caution in elderly patients; they may be at greater risk for prostatic hyperplasia, fluid retention, and transaminase elevations.

- Pediatrics: May accelerate bone maturation without producing compensatory gain in linear growth in children. In prepubertal children, perform radiographic examination of the hand and wrist every 6 months to determine the rate of bone maturation and to assess the effect of treatment on the epiphyseal centers.

- Women: Discontinue with evidence of mild virilization in women.

Dosage form specific issues:

- Tartrazine: Product may contain tartrazine.

Pregnancy Risk FactorX

LactationExcretion in breast milk unknown/contraindicated

Adverse Reactions

>10%:

Male: Priapism

Female: Menstrual problems (amenorrhea), virilism, breast soreness

Cardiovascular: Edema

Dermatologic: Acne

1% to 10%:

Male: Prostatic carcinoma, hirsutism (increase in pubic hair growth), impotence, testicular atrophy

Cardiovascular: Edema

Gastrointestinal: GI irritation, nausea, vomiting

Genitourinary: Prostatic hyperplasia

Hepatic: Hepatic dysfunction

<1%:

Male: Gynecomastia

Female: Amenorrhea

Hypercalcemia, leukopenia, polycythemia, hepatic necrosis, cholestatic hepatitis, hypersensitivity reactions

Oncology: Emetic PotentialVery low (<10%)

Drug Interactions

CycloSPORINE: Androgens may enhance the hepatotoxic effect of CycloSPORINE. Androgens may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Androgens may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Test InteractionsDecreased levels of thyroxine-binding globulin; decreased total T_4 serum levels; increased resin uptake of T_3 and T_4

Monitoring ParametersIn prepubertal children, perform radiographic examination of the hand and wrist every 6 months

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess results of laboratory tests, therapeutic effectiveness, and adverse response on a regular basis throughout therapy. Teach patient possible side effects/appropriate interventions and adverse symptoms to report. **Pregnancy risk factor X:** Determine that patient is not pregnant before beginning treatment. Instruct patients of childbearing age on appropriate contraceptive measures during therapy and for 1 month following therapy. Breast-feeding is contraindicated.

Patient EducationInform prescriber of all prescriptions, OTC medications, or herbal products you are taking, and any allergies you have. Do not take any new medication during therapy unless approved by prescriber. Take as directed; do not discontinue without consulting prescriber. If you have diabetes, monitor serum glucose closely and notify prescriber of changes; this medication can alter hypoglycemic requirements. May cause acne, growth of body hair, loss of libido, impotence, or menstrual irregularity (usually reversible); or nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Report changes in menstrual pattern; deepening of voice or unusual growth of body hair; fluid retention (swelling of ankles, feet, or hands, respiratory difficulty, or sudden weight gain); change in color of urine or stool; yellowing of eyes or skin; unusual bruising or bleeding; or other adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant and do not get pregnant during or for 1 month following therapy. Consult prescriber for instruction on appropriate contraceptive measures. This drug may cause severe fetal defects. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 10 mg

Androxy™: 10 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Androxy)

10 mg (30): $84.98

Mechanism of ActionSynthetic androgenic anabolic hormone responsible for the normal growth and development of male sex hormones and development of male sex organs and maintenance of secondary sex characteristics; synthetic testosterone derivative with significant androgen activity; stimulates RNA polymerase activity resulting in an increase in protein production; increases bone development; halogenated derivative of testosterone with up to 5 times the activity of methyltestosterone

Pharmacodynamics/Kinetics

Absorption: Rapid

Protein binding: 98%

Metabolism: Hepatic; enterohepatic recirculation

Half-life elimination: 10-100 minutes

Excretion: Urine (90%)

Dental Health: Effects on Dental Treatment No significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions
Mental Health: Effects on Mental Status None reported
Mental Health: Effects on Psychiatric Treatment May cause leukopenia; use caution with clozapine and carbamazepine
International Brand Names Afluteston (AT); Halotestin (AU, FR, HU, IT, NL, NO); Oralsterone (IT); Stenox (MX)

Flupenthixol

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(floo pen THIKS ol)

Canadian Brand NamesFluanxol®

Pharmacologic CategoryAntipsychotic Agent, Typical

Use: Labeled IndicationsMaintenance therapy of chronic schizophrenic patients whose main manifestations do **not** include excitement, agitation, or hyperactivity

Dosing: Adults

Psychotic symptoms:

I.M.: **Note:** Flupenthixol is administered by deep I.M. injection, preferably in the gluteus maximus, **not for I.V. use**; maintenance dosages are given at 2- to 3-week intervals

Test dose: Patients not previously treated with long-acting depot neuroleptics should be given an initial test dose of 5-20 mg. An initial dose of 20 mg is usually well tolerated; however, a 5 mg test dose is recommended in elderly, frail, and cachectic patients, and in patients whose individual or family history suggests a predisposition to extrapyramidal reactions. In the subsequent 5-10 days, the therapeutic response and the appearance of extrapyramidal symptoms should be carefully monitored. Oral neuroleptic drugs may be continued, but dosage should be reduced during this overlapping period and eventually discontinued.

Oral: Initial: 1 mg 3 times/day; dose must be individualized. May be increased by 1 mg every 2-3 days based on tolerance and control of symptoms. Usual maintenance dosage: 3-6 mg/day in divided doses (doses ≥12 mg/day used in some patients).

Dosing: ElderlyRefer to adult dosing.

Administration: I.M.Administer by deep I.M. injection, preferably in the gluteus maximus.

Administration: I.V.Not for I.V. use

StorageSolution: Store at room temperature. Protect from light.

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to flupenthixol, phenothiazines, thioxanthenes, or any component of the formulation; acute intoxication (ethanol, barbiturate, or opioid); severe CNS depression; coma; severely-agitated patients; suspected or established subcortical brain damage; cerebrovascular or renal insufficiency; severe cardiovascular disease/circulatory collapse; blood dyscrasias; pheochromocytoma

Allergy Considerations

- Thioxanthene Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Altered cardiac conduction: May alter cardiac conduction; life-threatening arrhythmias have occurred with therapeutic doses of antipsychotics. Avoid use in patients with underlying QT prolongation, in those taking medicines that prolong the QT interval, or cause polymorphic ventricular tachycardia; monitor ECG closely for dose-related QT effects. Adverse effects of decanoate may be prolonged.

- Anticholinergic effects: May cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); use with caution in patients with decreased gastrointestinal motility, paralytic ileus, urinary retention, BPH, xerostomia, or visual problems. Relative to other neuroleptics, flupenthixol has a low potency of cholinergic blockade.

- Blood dyscrasias: Myelosuppression (eg, leukopenia, agranulocytosis) has been observed with antipsychotic use; check blood counts periodically and discontinue at first signs of blood dyscrasias; use is contraindicated in patients with bone marrow suppression.

- Esophageal dysmotility/aspiration: Antipsychotic use has been associated with esophageal dysmotility and aspiration; use with caution in patients at risk of pneumonia (ie, Alzheimer's disease).

- Extrapyramidal symptoms (EPS): May cause extrapyramidal symptoms, including pseudoparkinsonism, acute dystonic reactions, akathisia, and tardive dyskinesia (risk of these reactions is high relative to other neuroleptics). Risk of dystonia (and possibly other EPS) may be greater with increased doses, use of conventional antipsychotics, males, and younger patients.

- Neuroleptic malignant syndrome (NMS): Use may be associated with NMS; monitor for mental status changes, fever, muscle rigidity, and/or autonomic instability (risk may be increased in patients with Parkinson's disease or Lewy body dementia).

- Orthostatic hypotension: May cause orthostatic hypotension; use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

- Pigmentary retinopathy: May be associated with pigmentary retinopathy.

- Sedation: May be sedating, use with caution in disorders where CNS depression is a feature; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Temperature regulation: Impaired core body temperature regulation may occur; caution with strenuous exercise, heat exposure, dehydration, and concomitant medication possessing anticholinergic effects.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with severe cardiovascular disease.

- Dementia: Elderly patients with dementia-related psychosis treated with antipsychotics are at an increased risk of death compared to placebo. An increased incidence of cerebrovascular adverse events (including fatalities) has been reported in elderly patients with dementia-related psychosis. Flupenthixol is not approved for this indication.

- Glaucoma: Use with caution in patients with narrow-angle glaucoma; condition may be exacerbated by cholinergic blockade. Screening is recommended.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis; condition may be exacerbated by cholinergic blockade.

- Parkinson's disease: Use with caution in patients with Parkinson's disease; they may be more sensitive to adverse effects.

- Prolactin-dependent tumors: Use with caution in patients with breast cancer or other prolactin-dependent tumors; elevates prolactin levels.

- Renal impairment: Use with caution in patients with renal impairment.

- Respiratory disease: Use with caution in patients with respiratory disease.

- Seizure disorder: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold.

Concurrent drug therapy issues:

- Antiemetic effects: May mask toxicity of other drugs or conditions (eg, intestinal obstruction, Reye's syndrome, brain tumor) due to antiemetic effects.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorC (based on similar agents)
LactationEnters breast milk/not recommended
Adverse ReactionsFrequency not defined.

Central nervous system: Extrapyramidal effects (up to 30%; including akathisia, dystonia, pseudoparkinsonism, tardive dyskinesia), anxiety/nervousness, insomnia, headache, dizziness, depression, fatigue

Dermatologic: Contact dermatitis, exfoliative dermatitis, pruritus, rash

Endocrine & metabolic: Galactorrhea, glycosuria, gynecomastia, hyperglycemia, libido decreased, weight gain

Gastrointestinal: Nausea, salivation increased, vomiting, xerostomia

Genitourinary: Micturition disorder

Neuromuscular & skeletal: Hypertonia, tremor, weakness

Ocular: Abnormal accommodation, abnormal vision

Miscellaneous: Diaphoresis increased

Additional adverse events associated with antipsychotics include arrhythmias, angioedema, hematologic adverse effects (agranulocytosis, hemolytic anemia, pancytopenia, thrombocytopenia), neuroleptic malignant syndrome (NMS), photosensitivity, seizure

Drug Interactions

Acetylcholinesterase Inhibitors (Central): May enhance the neurotoxic (central) effect of Antipsychotics. Severe extrapyramidal symptoms have occurred in some patients. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Amphetamines: Antipsychotics may diminish the stimulatory effect of Amphetamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Anti-Parkinson's Agents (Dopamine Agonist): Antipsychotics (Typical) may diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Lithium formulations: May enhance the neurotoxic effect of Antipsychotics. Lithium formulations may decrease the serum concentration of Antipsychotics. Specifically noted with chlorpromazine. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Tetrabenazine: May enhance the adverse/toxic effect of Antipsychotics. *Risk C: Monitor therapy*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Monitoring ParametersVital signs; lipid profile, fasting blood glucose/Hgb A_{1c}; BMI; mental status, abnormal involuntary movement scale (AIMS), extrapyramidal symptoms (EPS)

Monitoring: Lab TestsLipid profile, fasting blood glucose/Hgb A_{1c}; BMI

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as decanoate [depot]: 20 mg/mL (10 mL); 100 mg/mL (2 mL)

Tablet, as dihydrochloride: 0.5 mg, 3 mg

Generic AvailableNo

Mechanism of ActionFlupenthixol is a thioxanthene antipsychotic which blocks postsynaptic dopamine receptors in the CNS, resulting in inhibition of dopamine-mediated effects

Pharmacodynamics/Kinetics

Onset: I.M. depot: 24-72 hours following injection

Duration: I.M. depot: 2-4 weeks

Metabolism: Hepatic

Time to peak:

I.M. depot: 4-7 days

Oral: 3-8 hours

Excretion: Feces (as metabolites); urine (small amounts)

Related Information

- Teratogenic Risks of Psychotropic Medications

Pharmacotherapy PearlsNot available in U.S.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsFlupenthixol is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution.

Mental Health CommentPrimarily used as a long-acting injectable antipsychotic for patients who are nonadherent to oral medication treatment.

Coadministration of two or more antipsychotics does not generally improve clinical response and may increase the potential for adverse effects.

In 2008, the FDA issued a warning regarding increased mortality risk with typical **and** atypical antipsychotic drugs when used in elderly patients with dementia-related psychosis.

Index TermsFlupenthixol Decanoate; Flupenthixol Dihydrochloride

International Brand NamesDepixol (GB); Fluanxol (AT, BE, BG, CH, CL, CN, CZ, DE, DK, EE, FI, GB, HK, IL, IN, MY, NL, NO, NZ, PE, PH, PK, PT, SE, SG, TH, TW); Fluanxol Depot (AT, AU, BG, CH, CL, CZ, DE, DK, EE, FI, HK, HN, IL, IN, MY, NO, PE, PH, SE, SG, TH, TW, ZA); Psytixol (NZ)

Special Alerts

Antipsychotics (Conventional and Atypical): Association With an Increased Risk of Mortality in Elderly Patients Treated for Dementia-Related Psychosis - June 2008

The Food and Drug Administration (FDA) is notifying healthcare professionals that conventional antipsychotics (eg, haloperidol, fluphenazine) will now carry a similar boxed warning as atypical antipsychotics (eg, risperidone, aripiprazole) concerning an increased risk of mortality in elderly patients treated for dementia-related psychosis. Atypical antipsychotics received the boxed warning in April 2005 after study data from seven placebo-controlled trials indicated an increased risk of death in patients treated with certain atypicals for dementia-related behavioral disorders.

The FDA requirement to extend the warning to conventional antipsychotics was prompted by two recently published observational studies. Both studies revealed an increased risk of mortality in elderly patients treated with these medications. One of the two studies was a retrospective cohort study which examined 37,241 patients, ≥65 years of age, treated with antipsychotics. Of these patients, 12,882 received a conventional antipsychotic compared to 24,359 patients who received an atypical antipsychotic. All-cause mortality within the first 180 days of use was compared between the two groups. The results showed that the risk of death in patients who received a conventional-type antipsychotic was comparable to (and may be greater than) the risk of death in patients receiving an atypical. The second study was also a retrospective cohort study; it involved 27,259 matched pairs of patients, ≥66 years of age, diagnosed with dementia. Risk of death was compared in patients who received an atypical antipsychotic versus no antipsychotic, and in patients who received a conventional antipsychotic versus an atypical antipsychotic. An increased risk of death was observed in the groups receiving an atypical antipsychotic compared to no antipsychotic and also in patients receiving a conventional antipsychotic compared to patients receiving an atypical antipsychotic. This effect was seen at 30 days and persisted at 180 days, and was seen in both community-dwelling and long-term care facility patients.

The FDA believes that considering all the available evidence, conventional antipsychotics at least share a similar increased risk of death that has been observed with the use of atypical antipsychotics in elderly patients with dementia-related psychosis. The FDA is reminding practitioners that antipsychotic medications are not approved for the treatment of dementia-related psychosis. Elderly patients treated with antipsychotics, conventional or atypical, are at an increased risk of death. Practitioners prescribing antipsychotics to elderly patients for this purpose should inform the patient and their caregivers of this risk prior to prescribing.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antipsychotics

Medication Safety Issues

Sound-alike/look-alike issues:

Prolixin® may be confused with Proloprim®

International issues:

Prolixin® may be confused with Prolixan® which is a brand name for azapropazone in multiple international markets

Pronunciation(floo FEN a zeen)

Canadian Brand NamesApo-Fluphenazine Decanoate®; Apo-Fluphenazine®; Modecate®; Modecate® Concentrate; PMS-Fluphenazine Decanoate

Pharmacologic CategoryAntipsychotic Agent, Typical, Phenothiazine

Use: Labeled IndicationsManagement of manifestations of psychotic disorders and schizophrenia; depot formulation may offer improved outcome in individuals with psychosis who are nonadherent with oral antipsychotics

Use: Unlabeled/InvestigationalPervasive developmental disorder; nonpsychotic patient, dementia behavior in the elderly; psychosis/agitation related to Alzheimer's dementia

Dosing: Adults

Psychosis:

Oral: 0.5-10 mg/day in divided doses at 6- to 8-hour intervals; some patients may require up to 40 mg/day

I.M.: 2.5-10 mg/day in divided doses at 6- to 8-hour intervals (parenteral dose is $^{1}/_{3}$ to $^{1}/_{2}$ the oral dose for the hydrochloride salts)

Long-acting maintenance injections (Depot):

I.M. (decanoate): 12.5-37.5 mg every 2 weeks

Conversion from hydrochloride to decanoate I.M.: 0.5 mL (12.5 mg) decanoate every 3 weeks is approximately equivalent to 10 mg hydrochloride/day; **Note:** Clinically, an every-2-week interval is frequently utilized

Dosing: ElderlyNonpsychotic patient, dementia behavior (unlabeled use): Oral: 1-2.5 mg/day; increase dose at 4- to 7-day intervals by 1-2.5 mg/day. Increase dosing intervals (bid, tid) as necessary to control response or side effects. Maximum daily dose: 20 mg; gradual increases (titration) may prevent some side effects or decrease their severity.

Dosing: PediatricChildhood-onset pervasive developmental disorder (unlabeled use): Oral: 0.04 mg/kg/day

Dosing: Renal ImpairmentUse with caution; not dialyzable (0% to 5%).

Dosing: Hepatic ImpairmentUse with caution.

Administration: I.M.Watch for hypotension when administering I.M.

Administration: I.V. DetailpH: 4.8-5.2

Administration: OralAvoid contact of oral solution or injection with skin (contact dermatitis). Oral liquid should be diluted in the following **only**: Water, saline, homogenized milk, carbonated orange beverages, pineapple, apricot, prune, orange, tomato, and grapefruit juices. Do **not** dilute in beverages containing caffeine, tannics, or pectinate.

StorageAvoid freezing. Protect all dosage forms from light. Clear or slightly yellow solutions may be used. Should be dispensed in amber or opaque vials/bottles. Solutions may be diluted or mixed with fruit juices or other liquids, but must be administered immediately after mixing. Do not prepare bulk dilutions or store bulk dilutions.

Compatibility**Compatibility in syringe: Compatible:** Benztropine, diphenhydramine, hydroxyzine.

ContraindicationsHypersensitivity to fluphenazine or any component of the formulation (cross-reactivity between phenothiazines may occur); severe CNS depression; coma; subcortical brain damage; blood dyscrasias; hepatic disease

Allergy Considerations

- Phenothiazine Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Altered cardiac conduction: May alter cardiac conduction (life-threatening arrhythmias have occurred with therapeutic doses of phenothiazines).

- Anticholinergic effects: May cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); use with caution in patients with decreased gastrointestinal motility, paralytic ileus, urinary retention, BPH, xerostomia, or visual problems. Relative to other antipsychotics, fluphenazine has a low potency of cholinergic blockade.

- Blood dyscrasias: Check blood counts periodically and discontinue at first signs of blood dyscrasias; use is contraindicated in patients with bone marrow suppression.

- Esophageal dysmotility/aspiration: Antipsychotic use has been associated with esophageal dysmotility and aspiration; use with caution in patients at risk of pneumonia (ie, Alzheimer's disease).

- Extrapyramidal symptoms: May cause extrapyramidal symptoms, including pseudoparkinsonism, acute dystonic reactions, akathisia, and tardive dyskinesia (risk of these reactions is high relative to other neuroleptics).

- Hypotension: May occur, particularly with I.M. administration.

- Neuroleptic malignant syndrome (NMS): May be associated with NMS; monitor for mental status changes, fever, muscle rigidity, and/or autonomic instability (risk may be increased in patients with Parkinson's disease or Lewy body dementia).

- Orthostatic hypotension: May cause orthostatic hypotension; use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

- Pigmentary retinopathy: May be associated with pigmentary retinopathy.

- Sedation: May cause sedation, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Temperature regulation: Impaired core body temperature regulation may occur; caution with strenuous exercise, heat exposure, dehydration, and concomitant medication possessing anticholinergic effects.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with severe cardiovascular disease.

- Glaucoma: Use with caution in patients with narrow-angle glaucoma; condition may be exacerbated by cholinergic blockade. Screening is recommended.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis; condition may be exacerbated by cholinergic blockade.

- Parkinson's disease: Use with caution in patients with Parkinson's disease; they may be more sensitive to adverse effects.

- Prolactin-dependent tumors: Use with caution in patients with breast cancer or other prolactin-dependent tumors; elevates prolactin levels.

- Renal impairment: Use with caution in patients with renal impairment.

- Respiratory disease: Use with caution in patients with respiratory disease.

- Seizure disorder: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold.

Concurrent drug therapy issues:

- Antiemetic effects: May mask toxicity of other drugs or conditions (eg, intestinal obstruction, Reye's syndrome, brain tumor) due to antiemetic effects.

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; increased risk for developing tardive dyskinesia.

Dosage form specific issues:

- Depot: Adverse effects of depot injections may be prolonged.

Geriatric ConsiderationsAny changes in disease status in any organ system can result in behavior changes.

Many elderly patients receive antipsychotic medications for inappropriate nonpsychotic behavior. Before initiating antipsychotic medication, the clinician should investigate any possible reversible cause; any stress or stress from any disease can cause acute “confusion” or worsening of baseline nonpsychotic behavior. Most commonly, acute changes in behavior are due to increases in drug dose or addition of a new drug to regimen, fluid electrolyte loss, infections, and changes in environment.

In the treatment of agitated, demented, and elderly patients, authors of meta-analysis of controlled trials of the response to the traditional antipsychotics (phenothiazines, butyrophenones) in controlling agitation have concluded that the use of neuroleptics results in a response rate of 18%. Clearly, neuroleptic therapy for behavior control should be limited with frequent attempts to withdraw the agent given for behavior control.

Pregnancy Risk FactorC
LactationEnters breast milk/not recommended
Adverse ReactionsFrequency not defined.

Cardiovascular: Tachycardia, fluctuations in blood pressure, hyper-/hypotension, arrhythmia, edema

Central nervous system: Parkinsonian symptoms, akathisia, dystonias, tardive dyskinesia, dizziness, hyper-reflexia, headache, cerebral edema, drowsiness, lethargy, restlessness, excitement, bizarre dreams, EEG changes, depression, seizure, NMS, altered central temperature regulation

Dermatologic: Dermatitis, eczema, erythema, itching, photosensitivity, rash, seborrhea, skin pigmentation, urticaria

Endocrine & metabolic: Menstrual cycle changes, breast pain, amenorrhea, galactorrhea, gynecomastia, libido changes, prolactin increased, SIADH

Gastrointestinal: Weight gain, appetite loss, salivation, xerostomia, constipation, paralytic ileus, laryngeal edema

Genitourinary: Ejaculatory disturbances, impotence, polyuria, bladder paralysis, enuresis

Hematologic: Agranulocytosis, leukopenia, thrombocytopenia, nonthrombocytopenic purpura, eosinophilia, pancytopenia

Hepatic: Cholestatic jaundice, hepatotoxicity

Neuromuscular & skeletal: Trembling of fingers, SLE, facial hemispasm

Ocular: Pigmentary retinopathy, cornea and lens changes, blurred vision, glaucoma

Respiratory: Nasal congestion, asthma

Metabolism/Transport Effects**Substrate** of CYP2D6 (major); **Inhibits** CYP1A2 (weak), 2C9 (weak), 2D6 (weak), 2E1 (weak)
Drug Interactions

Acetylcholinesterase Inhibitors (Central): May enhance the neurotoxic (central) effect of Antipsychotics. Severe extrapyramidal symptoms have occurred in some patients. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: Antipsychotics may diminish the stimulatory effect of Amphetamines. *Risk C: Monitor therapy*

Analgesics (Opioid): Antipsychotic Agents (Phenothiazines) may enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antacids: May decrease the absorption of Antipsychotic Agents (Phenothiazines). *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antimalarial Agents: May increase the serum concentration of Antipsychotic Agents (Phenothiazines). *Risk C: Monitor therapy*

Anti-Parkinson's Agents (Dopamine Agonist): Antipsychotics (Typical) may diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

Beta-Blockers: Antipsychotic Agents (Phenothiazines) may enhance the hypotensive effect of Beta-Blockers. Beta-Blockers may decrease the metabolism of Antipsychotic Agents (Phenothiazines). Antipsychotic Agents (Phenothiazines) may decrease the metabolism of Beta-Blockers. **Exceptions:** Atenolol; Levobunolol; Metipranolol; Nadolol. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Lithium formulations: May enhance the neurotoxic effect of Antipsychotics. Lithium formulations may decrease the serum concentration of Antipsychotics. Specifically noted with chlorpromazine. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Tetrabenazine: May enhance the adverse/toxic effect of Antipsychotics. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid dong quai, St John's wort (may also cause photosensitization). Avoid kava kava, gotu kola, valerian, St John's wort (may increase CNS depression).

Monitoring ParametersVital signs; lipid profile, fasting blood glucose/Hgb A_{1c}; BMI; mental status, abnormal involuntary movement scale (AIMS), extrapyramidal symptoms (EPS)

Reference RangeTherapeutic: 0.3-3 ng/mL (SI: 0.6-6.0 nmol/L); correlation of serum concentrations and efficacy is controversial; most often dosed to best response

Nursing: Physical Assessment/MonitoringAssess other medications patient is taking for effectiveness and interactions. Review ophthalmic screening and assess results of laboratory tests, therapeutic effectiveness, and adverse reactions at beginning of therapy and periodically with long-term use. With I.M. or SubQ use, monitor closely for hypotension. Initiate at lower doses and taper dosage slowly when discontinuing. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsCBC prior to and regularly during therapy, lipid profile, liver and kidney function, fasting blood glucose/Hgb A_{1c}; BMI

Patient EducationUse exactly as directed; do not increase dose or frequency. Do not discontinue without consulting prescriber. Dilute with water, milk, orange or grapefruit juice; do not dilute with beverages containing caffeine, tannin, or pectinate (eg, coffee, colas, tea, or apple juice). Do not take within 2 hours of any antacid. Avoid alcohol or caffeine and other prescription or OTC medications not approved by prescriber. Avoid skin contact with medication; may cause contact dermatitis (wash immediately with warm, soapy water). Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience excess drowsiness, lightheadedness, dizziness, or blurred vision (use caution driving or when engaging in tasks requiring alertness until response to drug is known); dry mouth, upset stomach, nausea, vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); constipation (increased exercise, fluids, fruits, or fiber may help); postural hypotension (use caution climbing stairs or when changing position from lying or sitting to standing); urinary retention (void before taking medication); ejaculatory dysfunction (reversible); decreased perspiration (avoid strenuous exercise in hot environments); or photosensitivity (use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight). Report persistent CNS effects (eg, trembling fingers, altered gait or balance, excessive sedation, seizures, unusual movements, anxiety, abnormal thoughts, confusion, personality changes); chest pain, palpitations, rapid heartbeat, severe dizziness; unresolved urinary retention or changes in urinary pattern; altered menstrual pattern, change in libido, swelling or pain in breasts (male or female); vision changes; skin rash or irritation or yellowing of skin; or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Elixir, as hydrochloride: 2.5 mg/5 mL (60 mL) [contains alcohol 14% and sodium benzoate] [DSC]

Injection, oil, as decanoate: 25 mg/mL (5 mL) [may contain benzyl alcohol, sesame oil]

Injection, solution, as hydrochloride: 2.5 mg/mL (10 mL)

Solution, oral concentrate, as hydrochloride: 5 mg/mL (120 mL) [contains alcohol 14%]

Tablet, as hydrochloride: 1 mg, 2.5 mg, 5 mg, 10 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Solution (Fluphenazine Decanoate)

25 mg/mL (5): $29.99

Tablets (Fluphenazine HCl)

1 mg (90): $18.00

2.5 mg (60): $15.99

5 mg (60): $18.99

10 mg (60): $24.99

Mechanism of ActionFluphenazine is a piperazine phenothiazine antipsychotic which blocks postsynaptic mesolimbic dopaminergic D_1 and D_2 receptors in the brain; depresses the release of hypothalamic and hypophyseal hormones; believed to depress the reticular activating system, thus affecting basal metabolism, body temperature, wakefulness, vasomotor tone, and emesis

Pharmacodynamics/Kinetics

Onset of action: I.M., SubQ (derivative dependent): Hydrochloride salt: ~1 hour

Peak effect: Neuroleptic: Decanoate: 48-96 hours

Duration: Hydrochloride salt: 6-8 hours; Decanoate: 24-72 hours

Absorption: Oral: Erratic and variable

Distribution: Crosses placenta; enters breast milk

Protein binding: 91% and 99%

Metabolism: Hepatic

Half-life elimination (derivative dependent): Hydrochloride: 33 hours; Decanoate: 163-232 hours

Excretion: Urine (as metabolites)

Related Information

- Antipsychotic Agents

- Liquid Compatibility

Pharmacotherapy PearlsLess sedative and hypotensive effects than chlorpromazine.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and increased salivation (normal salivary flow resumes upon discontinuation). Orthostatic hypotension and nasal congestion are possible and since the drug is a dopamine antagonist, extrapyramidal symptoms of the TMJ are a possibility.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsMost pharmacology textbooks state that in presence of phenothiazines, systemic doses of epinephrine paradoxically decrease the blood pressure. This is the so called “epinephrine reversal” phenomenon. This has never been observed when epinephrine is given by infiltration as part of the anesthesia procedure.

Mental Health: Child/Adolescent ConsiderationsTwelve hospitalized children 7-11 years of age with childhood-onset pervasive developmental disorder received haloperidol or fluphenazine at an average dose of 0.04 mg/kg/day (Joshi, 1988).

Joshi PT, Capozzoli JA, and Coyle JT, “Low-Dose Neuroleptic Therapy for Children With Childhood-Onset Pervasive Developmental Disorder,” *Am J Psychiatry*, 1988, 145(3):335-8.

Mental Health CommentFluphenazine is a high-potency antipsychotic. Older antipsychotic medications (chlorpromazine, haloperidol), which do not meet specific criteria for “atypical” antipsychotics, are often referred to as typical antipsychotics. They are associated with the troubling side effect, EPS. However, it is commonly believed that in order for a drug to treat psychosis, it must block dopamine is some manner.

Common side effects include sedation and neuroleptic effect (reduced initiative, interest in the environment, and display of emotion or affect). All **typical** antipsychotics are considered to be equally effective if given in equipotent doses. An inverse relationship exists between intrinsic antimuscarinic activity and propensity to cause extrapyramidal side effects. If dystonia or pseudoparkinsonism occurs, antiparkinsonian agents should be considered. If akathisia occurs, beta-blockers (eg, propranolol), benzodiazepines, or antiparkinsonian agents should be considered. Tardive dyskinesia (TD) secondary to typical antipsychotics has an estimated incidence of 3% to 5% per year for the first 5 years of treatment. After this time period, the incidence is estimated to be 2% to 3% per year. Prevalence rates are ~15% to 20%. Female gender and age constitute risk factors for TD. Indeed, prevalence rates have been reported to be as high as 70% in elderly females. No specific treatment exists for TD, however, patients are often initiated on/switched to an atypical antipsychotic because of their lower incidence to cause TD and hopes of suppression.

Typical antipsychotics are usually only indicated for schizophrenia, but are generally effective for mania and psychosis and/or behavioral syndromes secondary to other mental conditions. Nonpsychiatric uses include Tourette's syndrome, Huntington's disease, and occasionally, intractable hiccups, pruritus, nausea, and vomiting.

These drugs are thought to exert their antipsychotic activity by blocking dopamine D_2 receptors in the mesolimbic dopaminergic pathway. Side effects are often related to their ability to antagonize dopamine receptors in the nigrostriatal and tuberoinfundibular pathways.

Long-acting dosage form is useful in patients nonadherent to treatment.

Coadministration of two or more antipsychotics does not generally improve clinical response and may increase the potential for adverse effects.

In 2008, the FDA issued a warning regarding increased mortality risk with typical **and** atypical antipsychotic drugs when used in elderly patients with dementia-related psychosis.

Anesthesia and Critical Care Concerns/Other ConsiderationsLess sedative and hypotensive effects than chlorpromazine

Index TermsFluphenazine Decanoate

Medication Safety Issues

Sound-alike/look-alike issues:

Cordran® may be confused with Cardura®, codeine, Cordarone®

Pronunciation(flure an DREN oh lide)

U.S. Brand NamesCordran®; Cordran® SP

Canadian Brand NamesCordran®

Pharmacologic CategoryCorticosteroid, Topical

Use: Labeled IndicationsInflammation of corticosteroid-responsive dermatoses [medium potency topical corticosteroid]

Dosing: Adults**Note:** Therapy should be discontinued when control is achieved; if no improvement is seen, reassessment of diagnosis may be necessary.

Steroid-responsive dermatosis: Topical (cream, lotion): Apply sparingly 2-3 times/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** Therapy should be discontinued when control is achieved; if no improvement is seen, reassessment of diagnosis may be necessary.

Steroid responsive dermatosis: Topical:

Cream: Apply sparingly 1-2 times/day

Tape: Apply once daily

ContraindicationsHypersensitivity to flurandrenolide or any component of the formulation; viral, fungal, or tubercular skin lesions

Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal suppression: Systemic absorption of topical corticosteroids may cause hypothalamic-pituitary-adrenal (HPA) axis suppression (reversible), particularly in younger children. HPA axis suppression may lead to adrenal crisis. Risk is increased when used over large surface areas, for prolonged periods, or with occlusive dressings.
- Contact dermatitis: Allergic contact dermatitis can occur. It is usually diagnosed by failure to heal rather than clinical exacerbation.
- Kaposi's sarcoma: Prolonged treatment with corticosteroids has been associated with the development of Kaposi's sarcoma (case reports); if noted, discontinuation of therapy should be considered.
- Systemic effects: Adverse systemic effects including hyperglycemia, glycosuria, fluid and electrolyte changes, and HPA suppression may occur when used on large surface areas, for prolonged periods, or with an occlusive dressing.

Special populations:

- Pediatrics: Chronic use of corticosteroids in children may interfere with growth and development.

Pregnancy Risk FactorC

Adverse ReactionsFrequency not defined.

Cardiovascular: Intracranial hypertension

Dermatologic: Acne, acneiform eruptions, allergic contact dermatitis, dry skin, folliculitis, hyperpigmentation, hypertrichosis, itching, maceration of the skin, miliaria, perioral dermatitis, skin atrophy, striae

Endocrine & metabolic: Cushing's syndrome, growth retardation, HPA suppression

Local: Burning, irritation

Miscellaneous: Secondary infection

Drug Interactions

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

Patient EducationA thin film is effective; do not overuse. Do not use tight-fitting diapers or plastic pants on children being treated in the diaper area. Use only as prescribed, and for no longer than the period prescribed. Apply sparingly in a light film and rub in lightly. Avoid contact with eyes. Notify prescriber if condition being treated persists or worsens. **Pregnancy precaution:** Inform prescriber if you are pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream, emulsified, as base (Cordran® SP): 0.05% (15 g, 30 g, 60 g)

Lotion (Cordran®): 0.05% (15 mL, 60 mL)

Tape, topical [roll] (Cordran®): 4 mcg/cm^2 (24 inch, 80 inch)

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Tape (Cordran)

4 mcg/cm^2 (1): $38.84

4 mcg/cm^2 (1): $79.55

Mechanism of ActionDecreases inflammation by suppression of migration of polymorphonuclear leukocytes and reversal of increased capillary permeability

Pharmacodynamics/Kinetics

Absorption: Adequate with intact skin; repeated applications lead to depot effects on skin, potentially resulting in enhanced percutaneous absorption

Metabolism: Hepatic

Excretion: Urine; feces (small amounts)

Related Information

- Corticosteroids

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Pharmacologic CategoryBenzodiazepine

Use: Labeled IndicationsShort-term treatment of insomnia

Dosing: AdultsInsomnia (short-term treatment): Oral: 15-30 mg at bedtime

Dosing: ElderlyOral: 15 mg at bedtime. Avoid use if possible.

Dosing: PediatricHypnotic: Oral:

<15 years: Dose not established

≥15 years: 15 mg at bedtime

Administration: OralGive 30 minutes to 1 hour before bedtime on an empty stomach with full glass of water. May be taken with food if GI distress occurs.

StorageStore at 15°C to 30°C (59°F to 86°F).

RestrictionsC-IV

ContraindicationsHypersensitivity to flurazepam or any component of the formulation (cross-sensitivity with other benzodiazepines may exist); narrow-angle glaucoma; pregnancy

Allergy Considerations

- Benzodiazepine Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anterograde amnesia: Benzodiazepines have been associated with anterograde amnesia.
- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Hypersensitivity reactions: Postmarketing studies have indicated that the use of hypnotic/sedative agents for sleep has been associated with hypersensitivity reactions including anaphylaxis as well as angioedema.
- Paradoxical reactions: Paradoxical reactions, including hyperactive or aggressive behavior, have been reported with benzodiazepines, particularly in adolescent/pediatric or psychiatric patients.
- Sleep-related activities: An increased risk for hazardous sleep-related activities such as sleep-driving; cooking and eating food, and making phone calls while asleep have also been noted.

Disease-related concerns:

- Depression: Use caution in patients with depression, particularly if suicidal risk may be present.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use (generally >10 days).
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Impaired gag reflux: Use with caution in patients with an impaired gag reflux.
- Renal impairment: Use with caution in patients with renal impairment.
- Respiratory disease: Use with caution in patients with respiratory disease.

Concurrent drug therapy issues:

- CNS depressants/psychoactive medications: Use with caution in patients receiving other CNS depressants or psychoactive medication; effects with other sedative drugs or ethanol may be potentiated.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; active metabolites with extended half-lives may lead to delayed accumulation and adverse effects.

- Elderly: Use with caution in the elderly; benzodiazepines have been associated with falls and traumatic injury. Active metabolites with extended half-lives may lead to delayed accumulation and adverse effects.

- Fall risk: Use with extreme caution in patients who are at risk of falls; benzodiazepines have been associated with falls and traumatic injury.

- Pediatrics: Safety and efficacy have not been established in children <15 years of age.

Other warnings/precautions:

- Appropriate use: Does not have analgesic, antidepressant, or antipsychotic properties.

- Hypnotic: Appropriate use: As a hypnotic, should be used only after evaluation of potential causes of sleep disturbance. Failure of sleep disturbance to resolve after 7-10 days may indicate psychiatric or medical illness. A worsening of insomnia or the emergence of new abnormalities of thought or behavior may represent unrecognized psychiatric or medical illness and requires immediate and careful evaluation.

- Withdrawal: Rebound or withdrawal symptoms may occur following abrupt discontinuation or large decreases in dose. Use caution when reducing dose or withdrawing therapy; decrease slowly and monitor for withdrawal symptoms. Flumazenil may cause withdrawal in patients receiving long-term benzodiazepine therapy.

Geriatric ConsiderationsDue to its long-acting metabolite, flurazepam is not considered a drug of choice in the elderly. Long-acting benzodiazepines have been associated with falls in the elderly. Interpretive guidelines from the Centers for Medicare and Medicaid Services (CMS) discourage the use of this agent in residents of long-term care facilities.

Pregnancy Risk FactorX

Pregnancy ConsiderationsAn increased risk of fetal malformations has been associated with maternal use of other benzodiazepines during the 1st trimester of pregnancy. Neonatal depression has been observed, specifically following exposure to flurazepam when used maternally for 10 consecutive days prior to delivery. Serum levels of N-desalkylflurazepam were measurable in the infant during the first 4 days of life. Use of flurazepam during pregnancy is contraindicated.

LactationExcretion in breast milk unknown/not recommended

Adverse ReactionsFrequency not defined.

Cardiovascular: Chest pain, flushing, hypotension, palpitation

Central nervous system: Apprehension, ataxia, confusion, depression, dizziness, drowsiness, euphoria, faintness, falling, hallucinations, hangover effect, headache, irritability, lightheadedness, memory impairment, nervousness, paradoxical reactions, restlessness, slurred speech, staggering, talkativeness

Dermatologic: Pruritus, rash

Gastrointestinal: Appetite increased/decreased, bitter taste, constipation, diarrhea, GI pain, heartburn, nausea, salivation increased/excessive, upset stomach, vomiting, weight gain/loss, xerostomia

Hematologic: Granulocytopenia, leukopenia

Hepatic: Alkaline phosphatase increased, ALT increased, AST increased, cholestatic jaundice, total bilirubin increased

Neuromuscular & skeletal: Body/joint pain, dysarthria, reflex slowing, weakness

Ocular: Blurred vision, burning eyes, difficulty focusing

Respiratory: Apnea, dyspnea

Miscellaneous: Diaphoresis, drug dependence

Postmarketing and/or case reports: Anaphylaxis, angioedema, complex sleep-related behavior (sleep-driving, cooking or eating food, making phone calls)

Metabolism/Transport Effects**Substrate** of CYP3A4 (major); **Inhibits** CYP2E1 (weak)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Aprepitant: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

CarBAMazepine: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Clozapine: Benzodiazepines may enhance the adverse/toxic effect of Clozapine. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Disulfiram: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Fosaprepitant: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). Specifically, the active metabolite aprepitant is likely responsible for this effect. *Risk C: Monitor therapy*

Grapefruit Juice: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Isoniazid: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Nefazodone: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Oral Contraceptive (Estrogens): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Oral Contraceptive (Progestins): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Phenytoin: Benzodiazepines may increase the serum concentration of Phenytoin. Short-term exposure to benzodiazepines may not present as much risk as chronic therapy. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). Management: Amprenavir, atazanavir, darunavir, indinavir, nelfinavir, ritonavir, and tipranavir are contraindicated with midazolam and triazolam according to each protease inhibitor's prescribing information. *Risk D: Consider therapy modification*

Proton Pump Inhibitors: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). **Exceptions:** Lansoprazole; Pantoprazole; Rabeprazole. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). **Exceptions:** Citalopram; Escitalopram; PARoxetine; Sertraline. *Risk C: Monitor therapy*

St Johns Wort: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Theophylline Derivatives: May diminish the therapeutic effect of Benzodiazepines. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Serum levels and response to flurazepam may be increased by grapefruit juice, but unlikely because of flurazepam's high oral bioavailability.

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Monitoring ParametersRespiratory and cardiovascular status

Reference RangeTherapeutic: 0-4 ng/mL (SI: 0-9 nmol/L); Metabolite N-desalkylflurazepam: 20-110 ng/mL (SI: 43-240 nmol/L); Toxic: >0.12 mcg/mL

Nursing: Physical Assessment/MonitoringFor short-term use. Assess effectiveness and interactions of other medications patient may be taking. Assess for history of addiction; long-term use can result in dependence, abuse, or tolerance. Be alert to possibility of anaphylaxis any time during therapy. Evaluate periodically for need for continued use. Monitor for CNS changes. After long-term use, taper dosage slowly when discontinuing. For inpatient use, institute safety measures and monitor effectiveness and adverse reactions. For outpatients, monitor therapeutic effectiveness and adverse reactions at beginning of therapy and periodically with long-term use. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report. **Pregnancy risk factor X:** Determine that patient is not pregnant before starting therapy. Do not give to sexually-active female patients unless capable of complying with contraceptive use.

Patient EducationUse exactly as directed; do not increase dose or frequency or discontinue without consulting prescriber. Drug may cause physical and/or psychological dependence. May take with food to decrease GI upset. While using this medication, do not use alcohol or other prescription or OTC medications (especially, pain medications, sedatives, antihistamines, or hypnotics) without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, dizziness, lightheadedness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); dry mouth, nausea, or vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); difficulty urinating (void before taking medication); or altered libido (resolves when medication is discontinued). Report CNS changes (confusion, depression, increased sedation, excitation, headache, abnormal thinking, insomnia, or nightmares, memory impairment, impaired coordination); muscle pain or weakness; respiratory difficulty; persistent dizziness, chest pain, or palpitations; unusual swelling, especially on face or neck; alterations in normal gait; vision changes; ringing in ears; or ineffectiveness of medication. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant during or for 1 month following therapy. Consult prescriber for instruction on appropriate contraceptive measures. This drug may cause severe fetal defects. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, as hydrochloride: 15 mg, 30 mg

Dalmane®: 15 mg, 30 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Capsules (Dalmane)

30 mg (30): $61.99

Capsules (Flurazepam HCl)

15 mg (30): $12.99

30 mg (30): $11.99

Mechanism of ActionBinds to stereospecific benzodiazepine receptors on the postsynaptic GABA neuron at several sites within the central nervous system, including the limbic system, reticular formation. Enhancement of the inhibitory effect of GABA on neuronal excitability results by increased neuronal membrane permeability to chloride ions. This shift in chloride ions results in hyperpolarization (a less excitable state) and stabilization.

Pharmacodynamics/Kinetics

Onset of action: Hypnotic: 15-20 minutes

Peak effect: 3-6 hours

Duration: 7-8 hours

Metabolism: Hepatic to N-desalkylflurazepam (active) and N-hydroxyethylflurazepam

Half-life elimination:

Flurazepam: 2.3 hours

N-desalkylflurazepam:

Adults: Single dose: 74-90 hours; Multiple doses: 111-113 hours

Elderly (61-85 years): Single dose: 120-160 hours; Multiple doses: 126-158 hours

Excretion: Urine: N-hydroxyethylflurazepam (22% to 55%); N-desalkylflurazepam (<1%)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation), and bitter taste.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health CommentIn 2007, the FDA requested that all manufacturers of sedative-hypnotic drug products revise labeling to include a greater emphasis on the risks of adverse effects. These risks include severe allergic reactions (anaphylaxis, angioedema) and complex sleep-related behaviors, which may include sleep-driving (driving while not fully awake and with no memory of the event), making phone calls, and preparing and eating food while asleep.

There are two subtypes of GABA receptors (GABA-A and GABA-B) and three different benzodiazepine receptors (Bz_1, Bz_2, and Bz_3). Benzodiazepine receptors and effects appear to be linked to the GABA-A receptors. Benzodiazepines do not bind to GABA-B receptors. The role of GABA-B receptors is unclear. Benzodiazepines have no specificity for benzodiazepine receptor subtypes.

Flurazepam is a long half-life benzodiazepine. Duration of action after a single dose is determined by redistribution rather than metabolism. Tolerance develops to the sedative, hypnotic, and anticonvulsant effects. It does not develop to the anxiolytic or skeletal muscle-relaxing effects. Psychological and physical dependence may occur with prolonged use of benzodiazepines. The onset of withdrawal symptoms is usually seen on the first day without drug and lasts 5-7 days in patients receiving short half-life benzodiazepines, whereas, the onset occurs after 5 days with a duration of 10-14 days after abrupt discontinuance of long half-life benzodiazepines. Risk factors for abuse include personal or family history of substance abuse and personality disorder.

Anesthesia and Critical Care Concerns/Other ConsiderationsChronic use of this agent may increase the perioperative benzodiazepine dose needed to achieve desired effect. Abrupt discontinuation after sustained use (generally >10 days) may cause withdrawal symptoms.

Index TermsFlurazepam Hydrochloride

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Flurbiprofen may be confused with fenoprofen

Ansaid® may be confused with Asacol®, Axid®

Ocufen® may be confused with Ocuflox®, Ocupress®

Pronunciation(flure BI proe fen)

U.S. Brand NamesOcufen®

Canadian Brand NamesAlti-Flurbiprofen; Ansaid®; Apo-Flurbiprofen®; Froben-SR®; Froben®; Novo-Flurprofen; Nu-Flurprofen; Ocufen®

Pharmacologic CategoryNonsteroidal Anti-inflammatory Drug (NSAID), Ophthalmic; Nonsteroidal Anti-inflammatory Drug (NSAID), Oral

Use: Labeled Indications

Oral: Treatment of rheumatoid arthritis and osteoarthritis

Ophthalmic: Inhibition of intraoperative miosis

Use: DentalOral: Management of postoperative pain

Dosing: Adults

Rheumatoid arthritis and osteoarthritis: Oral: 200-300 mg/day in 2, 3, or 4 divided doses; do not administer more than 100 mg for any single dose; maximum: 300 mg/day

Management of postoperative dental pain: 100 mg every 12 hours

Ophthalmic anti-inflammatory/surgical aid: Ophthalmic: Instill 1 drop every 30 minutes, beginning 2 hours prior to surgery (total of 4 drops in each affected eye)

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNot recommended in patients with advanced renal disease.

Administration: OralTake with a full glass of water.

Dietary ConsiderationsTablet may be taken with food, milk, or antacid to decrease GI effects.

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an oral outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to flurbiprofen, aspirin, other NSAIDs, or any component of the formulation; perioperative pain in the setting of coronary artery bypass (CABG) surgery

Allergy Considerations

- Nonsteroidal Anti-inflammatory Drug (NSAID) Allergy

Warnings/Precautions

Boxed warnings:

- Cardiovascular events: See “Concerns related to adverse effects” below.
- Coronary artery bypass graft surgery: See “Disease-related concerns” below.
- Gastrointestinal events: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Anaphylactoid reactions: Even in patients without prior exposure, anaphylactoid reactions may occur; patients with "aspirin triad" (bronchial asthma, aspirin intolerance, rhinitis) may be at increased risk. Do not use in patients who experience bronchospasm, asthma, rhinitis, or urticaria with NSAID or aspirin therapy.
- Bleeding/hemostasis: Platelet adhesion and aggregation may be decreased; may prolong bleeding time; patients with coagulation disorders or who are receiving anticoagulants should be monitored closely. Anemia may occur; patients on long-term NSAID therapy should be monitored for anemia.
- Cardiovascular events: **[U.S. Boxed Warning]: NSAIDs are associated with an increased risk of adverse cardiovascular thrombotic events, including**

MI, stroke, and new onset or worsening of pre-existing hypertension. Risk may be increased with duration of use or pre-existing cardiovascular risk factors or disease. Carefully evaluate individual cardiovascular risk profiles prior to prescribing. Use caution with fluid retention, heart failure, or hypertension. Concurrent administration of ibuprofen, and potentially other nonselective NSAIDs, may interfere with aspirin's cardioprotective effect. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of cardiovascular events; alternate therapies should be considered for patients at high risk.

- Gastrointestinal events: **[U.S. Boxed Warning]: NSAIDs may increase risk of gastrointestinal irritation, inflammation, ulceration, bleeding, and perforation.** These events may occur at any time during therapy and without warning. Use caution with a history of GI disease (bleeding or ulcers), concurrent therapy with aspirin, anticoagulants and/or corticosteroids, smoking, use of alcohol, the elderly, or debilitated patients. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of GI adverse events; alternate therapies should be considered for patients at high risk.

- Skin reactions: NSAIDs may cause serious skin adverse events including exfoliative dermatitis, Stevens-Johnson syndrome (SJS), and toxic epidermal necrolysis (TEN); discontinue use at first sign of skin rash or hypersensitivity.

Disease-related concerns:

- Asthma: Do not administer to patients with aspirin-sensitive asthma; severe bronchospasm may occur. Use caution in patients with other forms of asthma.

- Coronary artery bypass graft surgery: **[U.S. Boxed Warning]: Use is contraindicated for treatment of perioperative pain in the setting of coronary artery bypass graft (CABG) surgery.** Risk of MI and stroke may be increased with use following CABG surgery.

- Hepatic impairment: Use with caution in patients with decreased hepatic function. Closely monitor patients with any abnormal LFT. Severe hepatic reactions (eg, fulminant hepatitis, liver failure) have occurred with NSAID use, rarely; discontinue if signs or symptoms of liver disease develop, or if systemic manifestations occur.

- Renal impairment: NSAID use may compromise existing renal function; dose-dependent decreases in prostaglandin synthesis may result from NSAID use, reducing renal blood flow which may cause renal decompensation. Patients with impaired renal function, dehydration, heart failure, liver dysfunction, those taking diuretics, and ACE inhibitors, and the elderly are at greater risk of renal toxicity. Rehydrate patient before starting therapy; monitor renal function closely. Not recommended for use in patients with advanced renal disease. Long-term NSAID use may result in renal papillary necrosis.

Special populations:

- Elderly: The elderly are at increased risk for adverse effects (especially peptic ulceration, CNS effects, renal toxicity) from NSAIDs, even at low doses.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Surgical/dental procedures: Withhold for at least 4-6 half-lives prior to surgical or dental procedures.

Geriatric ConsiderationsElderly are a high-risk population for adverse effects from NSAIDs. As much as 60% of the elderly can develop peptic ulceration and/or hemorrhage asymptomatically. The concomitant use of H_2 blockers, omeprazole, and sucralfate is not effective as prophylaxis with the exception of NSAID-induced duodenal ulcers which may be prevented by the use of ranitidine. Misoprostol and proton pump inhibitors are the only agents proven to help prevent the development of NSAID-induced ulcers. Also, concomitant disease and drug use contribute to the risk for GI adverse effects. Use lowest effective dose for shortest period possible. Consider renal function decline with age. Use of NSAIDs can compromise existing renal function, especially when Cl_{cr} is ≤30 mL/minute. Tinnitus may be a difficult and unreliable indication of toxicity due to age-related hearing loss or eighth cranial nerve damage. CNS adverse effects, such as confusion, agitation, and hallucinations, are generally seen in overdose or high-dose situations, but elderly may demonstrate these adverse effects at lower doses than younger adults.

Pregnancy Risk FactorC/D (3rd trimester)

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies, however, adequate and well-controlled studies have not been conducted in pregnant women. Exposure late in pregnancy may lead to premature closure of the ductus arteriosus.

LactationEnters breast milk/not recommended

Adverse Reactions

Ophthalmic: Frequency not defined: Ocular: Slowing of corneal wound healing, mild ocular stinging, itching and burning, ocular irritation, fibrosis, miosis, mydriasis, bleeding tendency increased

Oral:

>1%:

Cardiovascular: Edema

Central nervous system: Amnesia, anxiety, depression, dizziness, headache, insomnia, malaise, nervousness, somnolence, vertigo

Dermatologic: Rash

Gastrointestinal: Abdominal pain, constipation, diarrhea, dyspepsia, flatulence, GI bleeding, nausea, vomiting, weight changes

Hepatic: Liver enzymes increased

Neuromuscular & skeletal: Reflexes increased, tremor, weakness

Ocular: Vision changes

Otic: Tinnitus

Respiratory: Rhinitis

<1% (Limited to important or life-threatening): Anaphylactic reaction, anemia, angioedema, asthma, bruising, cerebrovascular ischemia, CHF, confusion, eczema, eosinophilia, epistaxis, exfoliative dermatitis, fever, gastric/peptic ulcer, hematocrit decreased, hematuria, hemoglobin decreased, hepatitis, hypertension, hyperuricemia, interstitial nephritis, jaundice, leukopenia, paresthesia, parosmia, photosensitivity, pruritus, purpura, renal failure, stomatitis, thrombocytopenia, toxic epidermal necrolysis, urticaria, vasodilation

Metabolism/Transport Effects **Substrate** of CYP2C9 (minor); **Inhibits** CYP2C9 (strong)

Drug Interactions

ACE Inhibitors: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Aminoglycosides: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Aminoglycosides. Data only in premature infants. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Anticoagulants: Nonsteroidal Anti-Inflammatory Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Antiplatelet Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

Beta-Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Nonsteroidal Anti-Inflammatory Agents. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Bisphosphonate Derivatives. Both an increased risk of gastrointestinal ulceration and an increased risk of nephrotoxicity are of concern. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

CycloSPORINE: Nonsteroidal Anti-Inflammatory Agents may enhance the nephrotoxic effect of CycloSPORINE. Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Strong) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

Desmopressin: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Eplerenone: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Eplerenone. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk D: Consider therapy modification*

HydrALAZINE: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of HydrALAZINE. *Risk C: Monitor therapy*

Ketorolac: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. *Risk X: Avoid combination*

Latanoprost: NSAID (Ophthalmic) may diminish the therapeutic effect of Latanoprost. *Risk C: Monitor therapy*

Lithium: Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the diuretic effect of Loop Diuretics. *Risk C: Monitor therapy*

Methotrexate: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Methotrexate. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of other Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Pemetrexed: NSAID (Nonselective) may decrease the excretion of Pemetrexed. *Risk D: Consider therapy modification*

Probenecid: May increase the serum concentration of Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: Nonsteroidal Anti-Inflammatory Agents may enhance the neuroexcitatory and/or seizure-potentiating effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Salicylates: NSAID (Nonselective) may enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Choline Magnesium Trisalicylate. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk D: Consider therapy modification*

Thiazide Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Thrombolytic Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk C: Monitor therapy*

Vancomycin: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Vancomycin. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): NSAID (Nonselective) may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may enhance gastric mucosal irritation).

Food: Food may decrease the rate but not the extent of absorption.

Herb/Nutraceutical: Avoid alfalfa, anise, bilberry, bladderwrack, bromelain, cat's claw, celery, chamomile, coleus, cordyceps, dong quai, evening primrose, fenugreek, feverfew, garlic, ginger, ginkgo biloba, ginseng (American, Panax, Siberian), grapeseed, green tea, guggul, horse chestnut seed, horseradish, licorice, prickly ash, red clover, reishi, SAMe (S-adenosylmethionine), sweet clover, turmeric, white willow (all have additional antiplatelet activity).

Nursing: Physical Assessment/MonitoringEvaluate cardiac risk and potential for GI bleeding prior to prescribing this medication. **Assess for allergic reaction to salicylate or other NSAIDs**. Assess effectiveness and interactions of other medications patient may be taking. Monitor blood pressure at the beginning of therapy and periodically during use. Monitor therapeutic response and adverse reactions at beginning of therapy and periodically throughout therapy. Assess knowledge/teach patient proper use, appropriate interventions to reduce side effects, and adverse symptoms to report.

Patient EducationOral: Take this medication exactly as directed; do not increase dose without consulting prescriber. Do not crush tablets. Take with food or milk to reduce GI distress. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Do not use alcohol, aspirin or aspirin-containing medication, or any other anti-inflammatory medications without consulting prescriber. You may experience drowsiness, dizziness, nervousness, or headache (use caution when driving or engaging in tasks requiring alertness until response to drug is known); anorexia, nausea, vomiting, or heartburn (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or fluid retention (weigh yourself weekly and report unusual (3-5 lb/week) weight gain). GI bleeding, ulceration, or perforation can occur with or without pain; discontinue medication and contact prescriber if persistent abdominal pain or cramping, or blood in stool occurs. Report breathlessness, respiratory difficulty, or unusual cough; chest pain, rapid heartbeat, palpitations; unusual bruising/bleeding; blood in urine, stool, mouth, or vomitus; swollen extremities; skin rash or itching; acute fatigue; or hearing changes (ringing in ears). **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. This drug should not be used in the 3rd trimester of pregnancy. Breast-feeding is not recommended.

Ophthalmic: Wash hands before instilling. Sit or lie down to instill. Open eye, look at ceiling, and instill prescribed amount of medication. Close eye and roll eye in all directions, and apply gentle pressure to inner corner of eye. Do not let tip of applicator touch eye; do not contaminate tip of applicator (may cause eye infection, eye damage, or vision loss). Use protective dark eyewear until healed; avoid direct sunlight. Temporary stinging or burning may occur. Report persistent pain, burning, redness, vision changes, swelling, itching, or worsening of condition.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, ophthalmic, as sodium: 0.03% (2.5 mL)

Ocufen®: 0.03% (2.5 mL)

Tablet: 50 mg, 100 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Solution (Flurbiprofen Sodium)

0.03% (2.5): $15.99

Solution (Ocufen)

0.03% (2.5): $20.99

Tablets (Ansaid)

100 mg (60): $156.79

Tablets (Flurbiprofen)

50 mg (60): $18.99

100 mg (60): $21.99

Mechanism of ActionReversibly inhibits cyclooxygenase-1 and 2 (COX-1 and 2) enzymes, which result in decreased formation of prostaglandin precursors; has antipyretic, analgesic, and anti-inflammatory properties

Pharmacodynamics/Kinetics

Onset of action: ~1-2 hours

Distribution: V_d: 0.12 L/kg

Protein binding: 99%, primarily albumin

Metabolism: Hepatic via CYP2C9; forms metabolites such as 4-hydroxy-flurbiprofen (inactive)

Half-life elimination: 5.7 hours

Time to peak: 1.5 hours

Excretion: Urine (primarily as metabolites)

Related Information

- Nonsteroidal Anti-inflammatory Agents

Dental Health: Effects on Dental TreatmentNSAID formulations are known to reversibly decrease platelet aggregation via mechanisms different than observed with aspirin. The dentist should be aware of the potential of abnormal coagulation. Caution should also be exercised in the use of NSAIDs in patients already on anticoagulant therapy with drugs such as warfarin (Coumadin®).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness is common; may cause nervousness; may rarely cause drowsiness, confusion, depression, or hallucinations

Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine and carbamazepine; may decrease the clearance of lithium resulting in elevated serum levels and potential toxicity; monitor serum lithium levels

Cardiovascular Considerations

Blood Pressure: In short-term use, NSAIDs vary considerably in their effect on blood pressure. A meta-analysis (Pope, 1993) showed that indomethacin and naproxen had the largest effect on blood pressure. Other NSAIDs, including piroxicam, ibuprofen, and sulindac had less of an effect. Ibuprofen combined with captopril or losartan may attenuate the antihypertensive effects of ACE inhibition or receptor blockade on sitting or 24-hour ambulatory diastolic blood pressure. When NSAIDs are used in patients with hypertension, appropriate monitoring of blood pressure responses should be completed and the duration of therapy, when possible, kept short.

Heart Failure: The use of NSAIDs in the treatment of patients with congestive heart failure may be associated with an increased risk for fluid accumulation and edema. One study showed that NSAID use in elderly patients had an increased risk of hospitalization for heart failure. This study gives compelling reasons to avoid or limit the use of NSAIDs in patients with congestive heart failure, particularly in the elderly population. The ACC/AHA 2005 chronic heart failure guidelines suggest that NSAIDs be avoided or withdrawn whenever possible in patients with current or prior symptoms of heart failure and reduced LVEF.

Risk of Cardiovascular Events: Patients at increased risk of cardiovascular adverse events include patients immediately postoperative (10-14 days) from CABG surgery, and those with existing CAD, CVD, or history of TIA. Prescribers are encouraged to use the lowest effective dose for the shortest duration of time based on individual patient treatment goals. Available evidence reviewed by the FDA does not suggest an increased risk of serious CV events when NSAIDs are given short term and in the lower doses used OTC.

Drug Interactions: Nonsteroidal anti-inflammatory agents, including ibuprofen and naproxen, may diminish the cardioprotective effect of aspirin (Catella-Lawson F, 2001; Capone ML, 2005). It is surmised that ibuprofen may exhibit greater affinity than aspirin for the COX-1 site or if dosed regularly (or prior to aspirin), it would gain access to the active site first. In either case, aspirin's inhibition of COX (irreversible) would be limited in favor of ibuprofen inhibition (reversible). Avoid regular use of NSAIDs (nonselective) if possible. If used occasionally, take after aspirin (immediate release) ingestion.

Anesthesia and Critical Care Concerns/Other ConsiderationsThe 2002 ACCM/SCCM guidelines for analgesia (critically-ill adult) suggest that NSAIDs may be used in combination with opioids in select patients for pain management. Concern about adverse events (increased risk of renal dysfunction, altered platelet function, and gastrointestinal irritation) limits its use in patients who have other underlying risks for these events.

In short-term use, NSAIDs vary considerably in their effect on blood pressure. When NSAIDs are used in patients with hypertension, appropriate monitoring of blood pressure responses should be completed and the duration of therapy, when possible, kept short. The use of NSAIDs in the treatment of patients with congestive heart failure may be associated with an increased risk for fluid accumulation and edema; may precipitate renal failure in dehydrated patients.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Flutamide may be confused with Flumadine®, thalidomide

Eulexin® may be confused with Edecrin®, Eurax®

Pronunciation(FLOO ta mide)

U.S. Brand NamesEulexin®

Canadian Brand NamesApo-Flutamide®; Euflex®; Eulexin®; Novo-Flutamide

Pharmacologic CategoryAntineoplastic Agent, Antiandrogen

Use: Labeled IndicationsTreatment of metastatic prostatic carcinoma in combination therapy with LHRH agonist analogues

Use: Unlabeled/InvestigationalFemale hirsutism

Dosing: AdultsRefer to individual protocols.

Prostate carcinoma: Oral: 250 mg 3 times/day; alternatively, once-daily doses of 0.5-1.5 g have been used (unlabeled dosing)

Female hirsutism (unlabeled use): Oral: 250 mg daily

Dosing: ElderlyRefer to adult dosing.

Dosing: Combination Regimens

Prostate cancer:

FL

FZ

Administration: OralUsually administered orally in 3 divided doses. Contents of capsule may be opened and mixed with applesauce, pudding, or other soft foods. Mixing with a beverage is not recommended.

StorageStore at room temperature.

ContraindicationsHypersensitivity to flutamide or any component of the formulation; severe hepatic impairment; pregnancy

Allergy Considerations

- Flutamide Allergy

Warnings/Precautions

Boxed warnings:

- Liver failure: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Liver failure: **[U.S. Boxed Warning]: Hospitalization and, rarely, death due to liver failure have been reported in patients taking flutamide.** Elevated serum transaminase levels, jaundice, hepatic encephalopathy, and acute hepatic failure have been reported. In some patients, the toxicity reverses after discontinuation of therapy. About 50% of the cases occur within the first 3 months of treatment. Serum transaminase levels should be measured prior to starting treatment, monthly for 4 months, and periodically thereafter. Liver function tests should be obtained at the first suggestion of liver dysfunction (nausea, vomiting, abdominal pain, fatigue, anorexia, “flu-like” symptoms, hyperbilirubinuria, jaundice, or right upper quadrant tenderness). Should be immediately discontinued any time a patient has jaundice, and/or an ALT level greater than twice the upper limit of normal. Should not be used in patients whose ALT values are greater than twice the upper limit of normal.

Disease-related concerns:

- Hemoglobin M disease: Patients with hemoglobin M disease are at risk of toxicities associated with aniline exposure, including methemoglobinemia, hemolytic anemia, and cholestatic jaundice; monitor methemoglobin levels.

Special populations:

- Glucose-6 phosphate dehydrogenase deficiency: Patients with glucose-6 phosphate dehydrogenase deficiency are at risk of toxicities associated with aniline exposure, including methemoglobinemia, hemolytic anemia, and cholestatic jaundice; monitor methemoglobin levels.

- Smokers: Patients who smoke are at risk of toxicities associated with aniline exposure, including methemoglobinemia, hemolytic anemia, and cholestatic jaundice; monitor methemoglobin levels.
- Women: Product labeling states it is not for use in women, particularly for non-life-threatening conditions.

Geriatric ConsiderationsA study has shown that the addition of flutamide to leuprolide therapy in patients with advanced prostatic cancer increased median actuarial survival time to 34.9 months versus 27.9 months with leuprolide alone. No specific dose alterations are necessary in the elderly.

Pregnancy Risk FactorD

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

>10%:

Endocrine & metabolic: Breast tenderness, galactorrhea (9% to 42%), gynecomastia, hot flashes, impotence, libido decreased, tumor flare

Gastrointestinal: Nausea, vomiting (11% to 12%)

Hepatic: AST and LDH levels increased, transient, mild

1% to 10%:

Cardiovascular: Edema, hypertension (1%)

Central nervous system: Anxiety, confusion, depression, dizziness, drowsiness, headache, insomnia, nervousness

Dermatologic: Pruritus, ecchymosis, photosensitivity

Gastrointestinal: Anorexia, appetite increased, constipation, diarrhea, indigestion, upset stomach (4% to 6%)

Hematologic: Anemia (6%), leukopenia (3%), thrombocytopenia (1%)

Neuromuscular & skeletal: Weakness (1%)

Miscellaneous: Herpes zoster

<1%: Discoloration of urine (yellow), hepatic failure, hepatitis, hypersensitivity pneumonitis, jaundice, malignant breast neoplasm (male), MI, pulmonary embolism, sulfhemoglobinemia, thrombophlebitis

Oncology: Emetic PotentialLow (10% to 30%)

Metabolism/Transport Effects**Substrate** (major) of CYP1A2, 3A4; **Inhibits** CYP1A2 (weak)

Drug Interactions

CYP1A2 Inducers (Strong): May increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: No effect on bioavailability of flutamide.

Herb/Nutraceutical: St John's wort may decrease flutamide levels.

Monitoring ParametersSerum transaminase levels should be measured prior to starting treatment and should be repeated monthly for the first 4 months of therapy, and periodically thereafter. LFTs should be checked at the first sign or symptom of liver dysfunction (eg, nausea, vomiting, abdominal pain, fatigue, anorexia, flu-like symptoms, hyperbilirubinuria, jaundice, or right upper quadrant tenderness). Other parameters include tumor reduction, testosterone/estrogen, and phosphatase serum levels.

Nursing: Physical Assessment/MonitoringCarefully assess need for caution. Assess potential for interactions with other pharmacological agents or herbal products patient may be taking (risk for increased or decreased levels/effects of flutamide). Assess results of laboratory tests prior to and periodically during therapy (eg, serum transaminase levels). Therapeutic effectiveness (eg, reduction of tumor) and adverse response should be assessed on a regular basis throughout therapy (eg, galactorrhea, CNS changes, ataxia, anorexia, vomiting, lacrimation, anemia, liver function). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report (eg, chest pain, respiratory difficulty, abdominal pain, signs of liver dysfunction).

Monitoring: Lab TestsSerum transaminase levels should be obtained at baseline and repeated monthly for the first 4 months of therapy, and periodically thereafter. LFTs should be checked at the first sign or symptom of liver dysfunction. Other parameters include tumor reduction, testosterone/estrogen, prostate specific antigen, and phosphatase serum levels.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication will be prescribed in conjunction with another medication; take both exactly as directed; do not discontinue without consulting prescriber. May cause decreased libido, impotence, swelling of breasts, hot flashes, decreased appetite (small, frequent meals may help), or diarrhea (boiled milk, yogurt, or buttermilk may help). Report chest pain or palpitation; acute abdominal pain; pain, tingling, or numbness of extremities; swelling of extremities or unusual weight gain; respiratory difficulty; yellowing of skin or sclera, dark urine, pale stool, unusual fatigue; or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant and do not get pregnant during or for 1 month following therapy. Consult prescriber for instruction on appropriate barrier contraceptive measures. This drug may cause severe fetal defects. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 125 mg

Generic AvailableYes

ManufacturerSchering-Plough Corp

Pricing: U.S. (www.drugstore.com)

Capsules (Eulexin)

125 mg (180): $393.97

Mechanism of ActionNonsteroidal antiandrogen that inhibits androgen uptake or inhibits binding of androgen in target tissues

Pharmacodynamics/Kinetics

Absorption: Oral: Rapid and complete

Protein binding: Parent drug: 94% to 96%; 2-hydroxyflutamide: 92% to 94%

Metabolism: Extensively hepatic to more than 10 metabolites, primarily 2-hydroxyflutamide (active)

Half-life elimination: 5-6 hours (2-hydroxyflutamide)

Excretion: Primarily urine (as metabolites)

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay rarely cause nervousness or confusion

Mental Health: Effects on Psychiatric TreatmentNone reported

Index Terms4′-Nitro-3′-Trifluoromethylisobutyrantide; Niftolid; NSC-147834; SCH 13521

Medication Safety Issues

Sound-alike/look-alike issues:

Advair may be confused with Advicor®

Pronunciation(floo TIK a sone & sal ME te role)

U.S. Brand NamesAdvair Diskus®; Advair® HFA

Canadian Brand NamesAdvair Diskus®; Advair®

Pharmacologic CategoryBeta$_2$ Agonist; Beta$_2$-Adrenergic Agonist, Long-Acting; Corticosteroid, Inhalant (Oral)

Use: Labeled IndicationsMaintenance treatment of asthma; maintenance treatment of COPD

Dosing: Adults Do not use to transfer patients from systemic corticosteroid therapy.

COPD: Oral Inhalation:

Advair Diskus®: Fluticasone 250 mcg/salmeterol 50 mcg twice daily, 12 hours apart. **Note:** This is the maximum dose.

Advair Diskus® [Canadian labeling; not in approved U.S. labeling]: Fluticasone 250 mcg/salmeterol 50 mcg **or** fluticasone 500 mcg/salmeterol 50 mcg twice daily, 12 hours apart.

Maximum dose: Fluticasone 500 mcg/salmeterol 50 mcg per inhalation (2 inhalations/day)

Asthma (maintenance): Oral inhalation:

Advair Diskus®: One inhalation twice daily, morning and evening, 12 hours apart

Maximum dose: Fluticasone 500 mcg/salmeterol 50 mcg per inhalation (2 inhalations/day)

Advair® HFA: Two inhalations twice daily, morning and evening, 12 hours apart

Maximum dose: Fluticasone 230 mcg/salmeterol 21 mcg per inhalation (4 inhalations/day)

Advair® 125 or Advair® 250 [Canadian labeling; not in approved U.S. labeling]: Two inhalations twice daily, morning and evening, 12 hours apart

Maximum dose: Fluticasone 250 mcg/salmeterol 25 mcg per inhalation (4 inhalations/day)

Note: Initial dose prescribed should be based upon previous dose of inhaled-steroid asthma therapy. Dose should be increased after 2 weeks if adequate response is not achieved. Patients should be titrated to lowest effective dose once stable. Each suggestion below specifies the product strength to use; remember to **use 1 inhalation for Diskus® and 2 inhalations for HFA.**

Patients not currently on inhaled corticosteroids:

Advair Diskus®: Fluticasone 100 mcg/salmeterol 50 mcg **or** fluticasone 250 mcg/salmeterol 50 mcg

Advair® HFA: Fluticasone 45 mcg/salmeterol 21 mcg **or** fluticasone 115 mcg/salmeterol 21 mcg

Patients currently using inhaled beclomethasone dipropionate:

≤160 mcg/day: Fluticasone 100 mcg/salmeterol 50 mcg **or** Advair® HFA: Fluticasone 45 mcg/salmeterol 21 mcg

320 mcg/day: Fluticasone 250 mcg/salmeterol 50 mcg **or** Advair® HFA: Fluticasone 115 mcg/salmeterol 21 mcg

640 mcg/day: Fluticasone 500 mcg/salmeterol 50 mcg **or** Advair® HFA: Fluticasone 230 mcg/salmeterol 21 mcg

Patients currently using inhaled budesonide:

≤400 mcg/day: Fluticasone 100 mcg/salmeterol 50 mcg **or** Advair® HFA: Fluticasone 45 mcg/salmeterol 21 mcg

800-1200 mcg/day: Fluticasone 250 mcg/salmeterol 50 mcg **or** Advair® HFA: Fluticasone 115 mcg/salmeterol 21mcg

1600 mcg/day: Fluticasone 500 mcg/salmeterol 50 mcg **or** Advair® HFA: Fluticasone 230 mcg/salmeterol 21 mcg

Patients currently using inhaled flunisolide CFC aerosol:

≤1000 mcg/day: Fluticasone 100 mcg/salmeterol 50 mcg **or** Advair® HFA: Fluticasone 45 mcg/salmeterol 21 mcg

1250-2000 mcg/day: Fluticasone 250 mcg/salmeterol 50 mcg **or** Advair® HFA: Fluticasone 115 mcg/salmeterol 21 mcg

Patients currently using inhaled flunisolide HFA inhalation aerosol:

≤320 mcg/day: Fluticasone 100 mcg/salmeterol 50 mcg **or** Advair® HFA: Fluticasone 45 mcg/salmeterol 21 mcg

640 mcg/day: Fluticasone 250 mcg/salmeterol 50 mcg **or** Advair® HFA: Fluticasone 115 mcg/salmeterol 21 mcg

Patients currently using inhaled fluticasone HFA aerosol:

≤176 mcg/day: Fluticasone 100 mcg/salmeterol 50 mcg **or** Advair® HFA: Fluticasone 45 mcg/salmeterol 21 mcg

440 mcg/day: Fluticasone 250 mcg/salmeterol 50 mcg **or** Advair® HFA: Fluticasone 115 mcg/salmeterol 21 mcg

660-880 mcg/day: Fluticasone 500 mcg/salmeterol 50 mcg **or** Advair® HFA: Fluticasone 230 mcg/salmeterol 21 mcg

Patients currently using inhaled fluticasone propionate powder:

≤200 mcg/day: Fluticasone 100 mcg/salmeterol 50 mcg **or** Advair® HFA: Fluticasone 45 mcg/salmeterol 21 mcg

500 mcg/day: Fluticasone 250 mcg/salmeterol 50 mcg **or** Advair® HFA: Fluticasone 115 mcg/salmeterol 21 mcg

1000 mcg/day: Fluticasone 500 mcg/salmeterol 50 mcg **or** Advair® HFA: Fluticasone 230 mcg/salmeterol 21 mcg

Patients currently using inhaled mometasone furoate powder:

220 mcg/day: Fluticasone 100 mcg/salmeterol 50 mcg **or** Advair® HFA: Fluticasone 45 mcg/salmeterol 21 mcg

440 mcg/day: Fluticasone 250 mcg/salmeterol 50 mcg **or** Advair® HFA: Fluticasone 115 mcg/salmeterol 21 mcg

880 mcg/day: Fluticasone 500 mcg/salmeterol 50 mcg **or** Advair® HFA: Fluticasone 230 mcg/salmeterol 21 mcg

Patients currently using inhaled triamcinolone acetonide:

≤1000 mcg/day: Fluticasone 100 mcg/salmeterol 50 mcg **or** Advair® HFA: Fluticasone 45 mcg/salmeterol 21 mcg

1100-1600 mcg/day: Fluticasone 250 mcg/salmeterol 50 mcg **or** Advair® HFA: Fluticasone 115 mcg/salmeterol 21 mcg

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricAsthma: Oral inhalation:

Children 4-11 years: Advair Diskus®: Fluticasone 100 mcg/salmeterol 50 mcg twice daily, 12 hours apart. **Note:** This is the maximum dose.

Children ≥12 years: Refer to adult dosing.

Dosing: Hepatic ImpairmentNo dosage adjustment reacquired; manufacturer suggests close monitoring of patients with hepatic impairment.

Administration: Inhalation

Advair Diskus®: After removing from box and foil pouch, write the “Pouch opened” and “Use by” dates on the label on top of the Diskus®. The “Use by” date is 1 month from date of opening the pouch. Every time the lever is pushed back, a dose is ready to be inhaled. Do not close or tilt the Diskus® after the lever is pushed back. Do not play with the lever or move the lever more than once. The dose indicator tells you how many doses are left. When the numbers 5 to 0 appear in red, only a few doses remain. Discard device 1 month after you remove it from the foil pouch or when the dose counter reads “0” (whichever comes first). Rinse mouth with water after use to reduce risk of oral candidiasis.

Advair® HFA: Shake well for 5 seconds before each spray. Prime with 4 test sprays (into air and away from face) before using for the first time. If canister is dropped or not used for >4 weeks, prime with 2 sprays. Patient should contact pharmacy for refill when the dose counter reads “020”. Discard device when the dose counter reads “000”. Do not spray in eyes. Rinse mouth with water after use to reduce risk of oral candidiasis.

Dietary ConsiderationsAdvair Diskus® powder for oral inhalation contains lactose; very rare anaphylactic reactions have been reported in patients with severe milk protein allergy.

Storage

Advair Diskus®: Store at controlled room temperature of 20°C to 25°C (68°F to 77°F). Store in a dry place out of direct heat or sunlight. Diskus® device should be discarded 1 month after removal from foil pouch, or when dosing indicator reads “0” (whichever comes first); device is not reusable.

Advair® HFA: Store at controlled room temperature of 25°C (77°F). Store with mouthpiece down. Discard after 120 inhalations. Discard device when the dose counter reads “000”. Device is not reusable.

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to fluticasone, salmeterol, or any component of the formulation; status asthmaticus; acute episodes of asthma or COPD

Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Boxed warnings:

- Asthma-related deaths: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Adrenal suppression: Fluticasone may cause hypercorticism or suppression of hypothalamic-pituitary-adrenal (HPA) axis, particularly in younger children or in patients receiving high doses for prolonged periods. HPA axis suppression may lead to adrenal crisis. Withdrawal and discontinuation of a corticosteroid should be done slowly and carefully. Particular care is required when patients are transferred from systemic corticosteroids to inhaled products due to possible adrenal insufficiency or withdrawal from steroids, including an increase in allergic symptoms. Patients receiving ≥20 mg per day of prednisone (or equivalent) may be most susceptible. Concurrent use of ritonavir (and potentially other strong inhibitors of CYP3A4) may increase fluticasone levels and effects on HPA suppression. Fatalities have occurred due to adrenal insufficiency in asthmatic patients during and after transfer from systemic corticosteroids to aerosol steroids; aerosol steroids do not provide the systemic steroid needed to treat patients having trauma, surgery, or infections. Do not use this product to transfer patients from oral corticosteroid therapy.

- Asthma-related deaths: **[U.S. Boxed Warning]: Long-acting beta$_2$-agonists may increase the risk of asthma-related deaths.** In a large, randomized clinical trial (SMART, 2006), salmeterol was associated with a small, but statistically significant increase in asthma-related deaths (when added to usual asthma therapy); risk may be greater in African-American patients versus Caucasians. Salmeterol should only be used as adjuvant therapy in patients not adequately controlled on inhaled corticosteroids or whose disease requires two maintenance therapies.

- Bone density: Long-term use may affect bone mineral density in adults.

- Bronchospasm: Rarely, paradoxical bronchospasm may occur with use of inhaled bronchodilating agents; this should be distinguished from inadequate response.

- Hypersensitivity reactions: Immediate hypersensitivity reactions (urticaria, angioedema, rash, bronchospasm) have been reported.

- Immunosuppression: Prolonged use of corticosteroids may also increase the incidence of secondary infection, mask acute infection (including fungal infections), prolong or exacerbate viral infections, or limit response to vaccines. Exposure to chickenpox or measles should be avoided; corticosteroids should not be used to treat ocular herpes simplex. Corticosteroids should not be used for cerebral malaria. Close observation is required in patients with latent tuberculosis and/or TB reactivity; restrict use in active TB (only in conjunction with antituberculosis treatment). With oral inhalation, local yeast infections (eg, oral pharyngeal candidiasis) may occur; patient should rinse mouth and spit after each use to reduce incidence. Lower respiratory tract infections, including pneumonia, have been reported in patients with COPD using the oral inhalation with an even higher incidence in the elderly.

- Psychiatric manifestations: Corticosteroid use may cause psychiatric manifestations, including depression, euphoria, insomnia, mood swings, and personality changes. Pre-existing psychiatric conditions may be exacerbated by corticosteroid use.

- Serious effects/fatalities: Do not exceed recommended dose; serious adverse events, including fatalities, have been associated with excessive use of inhaled sympathomimetics.

- Upper airway symptoms: There have been reports of laryngeal spasm, irritation, and swelling (stridor, choking) with use.

- Vasculitis: Rare cases of vasculitis (Churg-Strauss syndrome) have been reported with fluticasone use.

Disease-related concerns:

- Asthma: Appropriate use: Do **not** use for acute asthmatic symptoms. Short-acting beta$_2$-agonist (eg, albuterol) should be used for acute symptoms and symptoms occurring between treatments. Do **not** initiate in patients with significantly worsening or acutely deteriorating asthma; reports of severe (sometimes fatal) respiratory events have been reported when salmeterol has been initiated in this situation. Fluticasone/salmeterol should only be used as adjuvant therapy in patients not adequately controlled on inhaled corticosteroids or whose disease requires two maintenance therapies. Corticosteroids should not be stopped or reduced when initiated. Fluticasone/salmeterol is not a substitute for systemic corticosteroids. During initiation watch for signs of worsening asthma.

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (arrhythmia, hypertension, or HF); beta-agonists may cause elevation in blood pressure, heart rate, and result in CNS stimulation/excitation. Beta$_2$-agonists may also increase risk of arrhythmias.

- Diabetes: Use with caution in patients with diabetes mellitus; beta$_2$ agonists may increase serum glucose.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Hypokalemia: Use with caution in patients with hypokalemia; beta$_2$ agonists may decrease serum potassium.

- Ocular disease: Use with caution in patients with cataracts and/or glaucoma; increased intraocular pressure, open-angle glaucoma, and cataracts have occurred with prolonged fluticasone use. Consider routine eye exams in chronic users.

- Osteoporosis: Use with caution in patients with osteoporosis; high doses and/or long-term use of corticosteroids have been associated with increased bone loss and osteoporotic fractures.

- Seizure disorders: Use with caution in patients with seizure disorders; beta-agonists may result in CNS stimulation/excitation.

- Thyroid disease: Changes in thyroid status may necessitate dosage adjustments; metabolic clearance of corticosteroids increases in patients with hyperthyroidism and decreases in hypothyroidism.

Special populations:

- Pediatrics: Orally-inhaled and intranasal corticosteroids may cause a reduction in growth velocity in pediatric patients (~1 centimeter per year [range 0.3-1.8 cm per year] and related to dose and duration of exposure). To minimize the systemic effects of orally-inhaled and intranasal corticosteroids, each patient should be titrated to the lowest effective dose. Growth should be routinely monitored in pediatric patients. Safety and efficacy have not been established in children <4 years of age (Advair Diskus®) and children <12 years of age (Advair® HFA).

Dosage form specific issues:

- Lactose: Powder for oral inhalation (Advair Diskus®) contains lactose; very rare anaphylactic reactions have been reported in patients with severe milk protein allergy.

Other warnings/precautions:

- Discontinuation of therapy: There have been reports of systemic corticosteroid withdrawal symptoms (eg, joint/muscle pain, lassitude, depression) when withdrawing oral inhalation therapy.

- Patient information: Patients must be instructed to use short-acting beta$_2$-agonist (eg, albuterol) for acute asthmatic or COPD symptoms and to seek medical attention in cases where acute symptoms are not relieved or a previous level of response is diminished. The need to increase frequency of use of inhaled short-acting beta$_2$-agonist may indicate deterioration of asthma, and treatment must not be delayed. Salmeterol should not be used more than twice daily; do not use with other long-acting beta$_2$ agonists.

Geriatric ConsiderationsNo differences in safety or effectiveness have been seen in studies of patients ≥65 years of age. However, increased sensitivity may be seen in the elderly. Use with caution in patients with concomitant cardiovascular disease.
Pregnancy Risk FactorC
Pregnancy ConsiderationsSee individual agents.
Lactation

Fluticasone: Excretion in breast milk unknown/use caution

Salmeterol: Enters breast milk/use caution

Adverse ReactionsPercentages reported in patients with asthma; also see individual agents:

>10%:

Central nervous system: Headache (12% to 21%)

Respiratory: Upper respiratory tract infection (16% to 27%), pharyngitis (9% to 13%)

>3% to 10%:

Central nervous system: Dizziness (1% to 4%)

Endocrine & metabolic: Menstruation symptoms (3% to 5%)

Gastrointestinal: Nausea/vomiting (3% to 6%), diarrhea (2% to 4%), pain/discomfort (1% to 4%), oral candidiasis (1% to 4%), gastrointestinal infections (including viral, ≤4%)

Neuromuscular & skeletal: Musculoskeletal pain (2% to 7%), muscle pain (≤4%)

Respiratory: Throat irritation (7% to 9%), bronchitis (2% to 8%), upper respiratory tract inflammation (4% to 7%), lower respiratory tract infections/pneumonia (1% to 7%; COPD diagnosis and age >65 years increase risk), cough (3% to 6%), sinusitis (4% to 5%), hoarseness/dysphonia (1% to 5%), viral respiratory tract infection (3% to 5%)

1% to 3%:

Cardiovascular: Arrhythmia, chest symptoms, fluid retention, MI, palpitation, syncope, tachycardia

Central nervous system: Compressed nerve syndromes, hypnagogic effects, migraine, pain, sleep disorders, tremor

Dermatologic: Dermatitis, dermatosis, eczema, hives, skin flakiness, urticaria, viral skin infection

Endocrine & metabolic: Hypothyroidism

Gastrointestinal: Constipation, dental discomfort/pain, gastrointestinal infection, hemorrhoids, oral discomfort/pain, oral erythema/rash, oral ulcerations, unusual taste, weight gain

Genitourinary: Urinary tract infection

Hematologic: Contusions/hematomas

Hepatic: Abnormal liver function tests

Neuromuscular & skeletal: Arthralgia, articular rheumatism, bone/cartilage disorders, bone pain, cramps, fractures, muscle injuries (≤3%), muscle spasm, muscle stiffness, tightness/rigidity

Ocular: Conjunctivitis, edema, eye redness, keratitis, xerophthalmia

Respiratory: Blood in nasal mucosa, congestion, ear/nose/throat infection, epistaxis, laryngitis, lower respiratory hemorrhage, nasal irritation, rhinitis, rhinorrhea/postnasal drip, sneezing

Miscellaneous: Allergies/allergic reactions, bacterial infection, burns, candidiasis (≤3%), diaphoresis, sweat/sebum disorders, viral infection, wounds and lacerations

Postmarketing and/or case reports: Asthma exacerbation (serious and some fatal), abdominal pain, agitation, aggression, anaphylactic reaction (Diskus®: some in patients with severe milk allergy), angioedema, aphonia, atrial fibrillation, bronchospasm, cataracts, chest congestion, chest tightness, choking, contact dermatitis, Cushing syndrome, Cushingoid features, depression, dysmenorrhea, dyspepsia, dyspnea, earache, ecchymoses, edema (facial, oropharyngeal), eosinophilic conditions, glaucoma, growth velocity reduction in children/adolescents, hypercorticism, hyperglycemia, hypersensitivity reaction (immediate and delayed), hypertension, hypokalemia, hypothyroidism, influenza, intraocular pressure increased, laryngeal spasm/irritation, irregular menstruation, myositis, osteoporosis, pallor, paresthesia, paradoxical tracheitis, paranasal sinus pain, photodermatitis, PID, rash, restlessness, stridor, supraventricular tachycardia, syncope, vaginal candidiasis, vaginitis, vulvovaginitis, rare cases of vasculitis (Churg-Strauss syndrome), ventricular tachycardia, wheezing, xerostomia

Metabolism/Transport EffectsFluticasone: **Substrate** of CYP3A4 (major); Salmeterol: **Substrate** of CYP3A4 (major)

Drug Interactions

Alpha-/Beta-Blockers: May diminish the therapeutic effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Amphotericin B: Corticosteroids (Orally Inhaled) may enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Antidiabetic Agents: Corticosteroids (Orally Inhaled) may diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Corticosteroids (Orally Inhaled). *Risk C: Monitor therapy*

Atomoxetine: May enhance the tachycardic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Beta-Blockers (Beta1 Selective): May diminish the bronchodilatory effect of Beta2-Agonists. Of particular concern with nonselective beta-blockers or higher doses of the beta1 selective beta-blockers. *Risk C: Monitor therapy*

Beta-Blockers (Nonselective): May diminish the bronchodilatory effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Betahistine: May diminish the therapeutic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May increase the serum concentration of Salmeterol. *Risk X: Avoid combination*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Loop Diuretics: Corticosteroids (Orally Inhaled) may enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the metabolism of Corticosteroids (Orally Inhaled). *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Thiazide Diuretics: Corticosteroids (Orally Inhaled) may enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Monitoring ParametersFEV_1, peak flow, and/or other pulmonary function tests; blood pressure, heart rate; CNS stimulation. Monitor for increased use of short-acting beta$_2$-agonist inhalers; may be marker of a deteriorating asthma condition. The growth of pediatric patients receiving inhaled corticosteroids should be monitored routinely (eg, via stadiometry).

Nursing: Physical Assessment/MonitoringSee individual agents.

Monitoring: Lab TestsFEV_1, peak flow, and/or other pulmonary function tests

Patient EducationSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product; [CAN] = Canadian brand name/formulation

Aerosol, for oral inhalation:

Advair® HFA:

45/21: Fluticasone propionate 45 mcg and salmeterol 21 mcg (12 g) [120 metered inhalations]

115/21: Fluticasone propionate 115 mcg and salmeterol 21 mcg (12 g) [120 metered inhalations]

230/21: Fluticasone propionate 230 mcg and salmeterol 21 mcg (12 g) [120 metered inhalations]

Advair® [CAN]:

125/25: Fluticasone propionate 125 mcg and salmeterol 25 mcg (12 g) [120 metered inhalations] [not available in the U.S.]

250/25: Fluticasone propionate 250 mcg and salmeterol 25 mcg (12 g) [120 metered inhalations] [not available in the U.S.]

Powder, for oral inhalation:

Advair Diskus®:

100/50: Fluticasone propionate 100 mcg and salmeterol 50 mcg (14s, 28s [DSC], 60s) [contains lactose; chlorofluorocarbon free]

250/50: Fluticasone propionate 250 mcg and salmeterol 50 mcg (14s [DSC], 60s) [contains lactose; chlorofluorocarbon free]

500/50: Fluticasone propionate 500 mcg and salmeterol 50 mcg (14s [DSC], 60s) [contains lactose; chlorofluorocarbon free]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Aerosol (Advair HFA)

45-21 mcg/ACT (12): $178.76

115-21 mcg/ACT (12): $198.42

230-21 mcg/ACT (12): $269.91

Misc (Advair Diskus)

100-50 mcg/dose (60): $173.35

250-50 mcg/dose (60): $204.70

500-50 mcg/dose (28): $189.90

500-50 mcg/dose (60): $269.91

Mechanism of ActionCombination of fluticasone (corticosteroid) and salmeterol (long-acting beta$_2$-agonist) designed to improve pulmonary function and control over what is produced by either agent when used alone. Because fluticasone and salmeterol act locally in the lung, plasma levels do not predict therapeutic effect.

Fluticasone: The mechanism of action for all topical corticosteroids is believed to be a combination of three important properties: Anti-inflammatory activity, immunosuppressive properties, and antiproliferative actions. Fluticasone has extremely potent vasoconstrictive and anti-inflammatory activity.

Salmeterol: Relaxes bronchial smooth muscle by selective action on beta$_2$-receptors with little effect on heart rate

Pharmacodynamics/KineticsSee individual agents.

Related Information

- Fluticasone
- Salmeterol

Pharmacotherapy PearlsEffects of inhaled/intranasal steroids on growth have been observed in the absence of laboratory evidence of HPA axis suppression, suggesting that growth velocity is a more sensitive indicator of systemic corticosteroid exposure in pediatric patients than some commonly used tests of HPA axis function. The long-term effects of this reduction in growth velocity associated with orally-inhaled and intranasal corticosteroids, including the impact on final adult height, are unknown. The potential for “catch up” growth following discontinuation of treatment with inhaled corticosteroids has not been adequately studied.

Advair® HFA: Salmeterol (base) 21 mcg is equivalent to 30.45 mcg of salmeterol xinafoate.

Dental Health: Effects on Dental TreatmentLocalized infections with *Candida albicans* or *Aspergillus niger* have occurred frequently in the mouth and pharynx with repetitive use of oral inhaler of corticosteroids. These infections may require treatment with appropriate antifungal therapy or discontinuance of treatment with corticosteroid inhaler.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause headache, nervousness, dizziness, fatigue, or sleep disorders

Mental Health: Effects on Psychiatric TreatmentPropranolol may decrease the effects of salmeterol and cause bronchospasm in asthmatics. Combined use with MAO inhibitors and TCAs may increase the risk of cardiovascular toxicity (avoid concurrent use and within 14 days after discontinuing this agents).

Cardiovascular ConsiderationsCombination therapy for the treatment of asthma should be individualized for each patient. Inhaled steroid therapy, usually used for chronic obstructive lung disease, has the important advantage of having minimal systemic effects. Inhaled beta-agonists may increase heart rate. This should be considered in patients with disease states that may require heart rate control (eg, atrial fibrillation) since frequent use may counteract pharmacologic interventions directed at rate control.

Because of the frequent coexistence of chronic obstructive lung disease and coronary artery disease, many patients may require concurrent therapy with beta-agonists and beta-blockade. Selectivity for the beta-1 receptor varies among the available beta blockers. Cardioselective beta blockade (eg, atenolol, esmolol, metoprolol) with careful titration is preferred when this situation exists (Anderson, 2007). When an inhaled beta-agonist becomes necessary, monitor heart rate closely.

Anesthesia and Critical Care Concerns/Other ConsiderationsInhaled steroid therapy, usually used for chronic obstructive lung disease; has the important advantage of having minimal systemic effects. Beta-agonists may induce increases in heart rate. This should be considered in patients with resting tachycardia. Frequent use of inhaled beta-agonists when used in patients with atrial fibrillation may counteract pharmacologic interventions directed at ventricular rate control. It may take ≥1 week to see full benefits from treatment. This agent is not to be used for the relief of acute attacks.

Index Terms Fluticasone Propionate and Salmeterol Xinafoate; Salmeterol and Fluticasone

Medication Safety Issues

Sound-alike/look-alike issues:

Cutivate® may be confused with Ultravate®

International issues:

Allegro® [Israel] may be confused with Allegra® which is a brand name for fexofenadine in the U.S.

Allegro®: Brand name for frovatriptan in Germany

Flovent® may be confused with Flogen® which is a brand name for naproxen in Mexico

Pronunciation(floo TIK a sone)

U.S. Brand NamesCutivate®; Flonase®; Flovent® Diskus®; Flovent® HFA; Veramyst™

Canadian Brand NamesApo-Fluticasone; Avamys™; Cutivate™; Flonase®; Flovent® Diskus®; Flovent® HFA; ratio-Fluticasone

Pharmacologic CategoryCorticosteroid, Inhalant (Oral); Corticosteroid, Nasal; Corticosteroid, Topical

Use: Labeled Indications

Oral inhalation: Maintenance treatment of asthma as prophylactic therapy; also indicated for patients requiring oral corticosteroid therapy for asthma to assist in total discontinuation or reduction of total oral dose

Intranasal:

Flonase®: Management of seasonal and perennial allergic rhinitis and nonallergic rhinitis

Veramyst™: Management of seasonal and perennial allergic rhinitis

Avamys™ [CAN]: Management of seasonal allergic rhinitis

Topical: Relief of inflammation and pruritus associated with corticosteroid-responsive dermatoses; atopic dermatitis

Dosing: Adults

Asthma: Inhalation, oral: **Note:** Titrate to the lowest effective dose once asthma stability is achieved

Flovent® HFA: Manufacturers labeling: Dosing based on previous therapy

Bronchodilator alone: Recommended starting dose: 88 mcg twice daily; highest recommended dose: 440 mcg twice daily

Inhaled corticosteroids: Recommended starting dose: 88-220 mcg twice daily; highest recommended dose: 440 mcg twice daily; a higher starting dose may be considered in patients previously requiring higher doses of inhaled corticosteroids

Oral corticosteroids:

Recommended starting dose: 440 mcg twice daily

Highest recommended dose: 880 mcg twice daily; starting dose is patient dependent. In patients on chronic oral corticosteroids therapy, reduce prednisone dose no faster than 2.5-5 mg/day on a weekly basis; begin taper after 1 week of fluticasone therapy.

NIH Asthma Guidelines (NIH, 2007) (administer in divided doses twice daily):

“Low” dose: 88-264 mcg/day

“Medium” dose: 264-440 mcg/day

“High” dose: >440 mcg/day

Flovent® Diskus® *(U.S. labeling)*: **Note:** May increase dose after 2 weeks of therapy in patients not adequately controlled. Higher starting doses may be considered in patients with poorer asthma control or those requiring high ranges of inhaled corticosteroids. Titrate to the lowest effective dose once asthma stability is achieved.

Bronchodilator alone: Recommended starting dose: 100 mcg twice daily; maximum recommended dose: 500 mcg twice daily

Inhaled corticosteroids: Recommended starting dose: 100-250 mcg twice daily; maximum recommended dose: 500 mcg twice daily

Oral corticosteroids: Recommended starting dose: 500-1000 mcg twice daily; maximum recommended dose: 1000 mcg twice daily.

Starting dose is patient dependent. In patients on chronic oral corticosteroids therapy, reduce prednisone dose no faster than 2.5 mg/day on a weekly basis; begin taper after 1 week of fluticasone therapy.

Flovent® Diskus® *(Canadian labeling)*:

Mild asthma: 100-250 mcg twice daily

Moderate asthma: 250-500 mcg twice daily

Severe asthma: 500 mcg twice daily; may increase to 1000 mcg twice daily in very severe patients requiring high doses of corticosteroids

Corticosteroid-responsive dermatoses: Topical: Cream, lotion, ointment: Apply sparingly to affected area twice daily. If no improvement is seen within 2 weeks, reassessment of diagnosis may be necessary.

Atopic dermatitis: Topical: Cream, lotion: Apply sparingly to affected area once or twice daily. If no improvement is seen within 2 weeks, reassessment of diagnosis may be necessary.

Rhinitis: Intranasal:

Flonase® (fluticasone propionate): Initial: 2 sprays (50 mcg/spray) per nostril once daily; may also be divided into 100 mcg twice a day. After the first few days, dosage may be reduced to 1 spray per nostril once daily for maintenance therapy.

Veramyst™ (fluticasone furoate): Initial: 2 sprays (27.5 mcg/spray) per nostril once daily (110 mcg/day). Once symptoms are controlled, may reduce dosage to 1 spray per nostril once daily (55 mcg/day) for maintenance therapy.

Avamys™ [CAN] (fluticasone furoate): 2 sprays (27.5 mcg/spray) in each nostril once daily (110 mcg/day). Total daily dosage should not exceed 2 sprays in each nostril (110 mcg)/day.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Asthma: Inhalation, oral:

Flovent® HFA:

Children 4-11 years: 88 mcg twice daily

Children ≥12 years: Refer to adult dosing.

NIH Asthma Guidelines (NIH, 2007) (administer in divided doses twice daily):

"Low" dose:

0-4 years: 176 mcg/day

5-11 years: 88-176 mcg/day

≥12 years: 88-264 mcg/day

"Medium" dose:

0-4 years: >176-352 mcg/day

5-11 years: >176-352 mcg/day

≥12 years: >264-440 mcg/day

"High" dose:

0-4 years: >352 mcg/day

5-11 years: >352 mcg/day

≥12 years: >440 mcg/day

Flovent® Diskus® *(U.S. labeling)*:

Children 4-11 years: Usual starting dose: 50 mcg twice daily; may increase to 100 mcg twice daily in patients not adequately controlled after 2 weeks of therapy. Higher starting doses may be considered in patients with poorer asthma control or those requiring high ranges of inhaled corticosteroids. Titrate to the lowest effective dose once asthma stability is achieved (maximum dose: 100 mcg twice daily)

Children >11 years: Refer to adult dosing.

Flovent® Diskus® *(Canadian labeling)*:

Children 4-16 years: Usual starting dose: 50-100 mcg twice daily; may increase to 200 mcg twice daily in patients not adequately controlled; titrate to the lowest effective dose once asthma stability is achieved

Children ≥16 years: Refer to adult dosing.

Corticosteroid-responsive dermatoses: Topical: Children ≥3 months: Cream: Apply sparingly to affected area twice daily. If no improvement is seen within 2 weeks, reassessment of diagnosis may be necessary. **Note:** Safety and efficacy of treatment >4 weeks duration have not been established.

Atopic dermatitis: Topical:

Children ≥3 months: Cream: Apply sparingly to affected area 1-2 times/day. If no improvement is seen within 2 weeks, reassessment of diagnosis may be necessary.

Children ≥1 year: Lotion: Apply sparingly to affected area once daily.

Note: Safety and efficacy of treatment >4 weeks duration have not been established.

Rhinitis: Intranasal:

Flonase® (fluticasone propionate): Children ≥4 years and Adolescents: Initial: 1 spray (50 mcg/spray) per nostril once daily; patients not adequately responding or patients with more severe symptoms may use 2 sprays (100 mcg) per nostril. Depending on response, dosage may be reduced to 100 mcg daily. Total daily dosage should not exceed 2 sprays in each nostril (200 mcg)/day. Dosing should be at regular intervals.

Veramyst™ (fluticasone furoate):

Children 2-11 years: Initial: 1 spray (27.5 mcg/spray) per nostril once daily (55 mcg/day); patients not adequately responding may use 2 sprays per nostril once daily (110 mcg/day). Once symptoms are controlled, dosage may be reduced to 55 mcg once daily. Total daily dosage should not exceed 2 sprays in each nostril (110 mcg)/day.

Children ≥12 years and Adolescents: Initial: 2 sprays (27.5 mcg/spray) per nostril once daily (110 mcg/day). Once symptoms are controlled, dosage may be reduced to 1 spray per nostril once daily (55 mcg/day). Total daily dosage should not exceed 2 sprays in each nostril (110 mcg)/day.

Avamys™ (fluticasone furoate) [CAN]:Children ≥12 years: 2 sprays (27.5 mcg/spray) in each nostril once daily (110 mcg/day). Total daily dosage should not exceed 2 sprays in each nostril (110mcg)/day.

Dosing: Hepatic ImpairmentFluticasone is primarily cleared in the liver. Fluticasone plasma levels may be increased in patients with hepatic impairment, use with caution; monitor.

Administration: Inhalation

Aerosol inhalation: Flovent® HFA: Shake container thoroughly before using. Take 3-5 deep breaths. Use inhaler on inspiration. Allow 1 full minute between inhalations. Rinse mouth with water after use to reduce aftertaste and incidence of candidiasis; do not swallow. Flovent® HFA inhaler must be primed before first use, when not used for 7 days, or if dropped. To prime the first time, release 4 sprays into air; shake well before each spray and spray away from face. If dropped or not used for 7 days, prime by releasing a single test spray. Patient should contact pharmacy for refill when the dose counter reads “020”. Discard device when the dose counter reads “000”. Do not use “float” test to determine contents.

Nasal spray: Administer at regular intervals. Shake bottle gently before using. Blow nose to clear nostrils. Insert applicator into nostril, keeping bottle upright, and close off the other nostril. Breathe in through nose. While inhaling, press pump to release spray. Discard after labeled number of doses has been used, even if bottle is not completely empty.

Flonase®: Prime pump (press 6 times until fine spray appears) prior to first use or if spray unused for ≥7 days. Once weekly, nasal applicator may be removed and rinsed with warm water to clean.

Veramyst™, Avamys™ [CAN]: Prime pump (press 6 times until fine spray appears) prior to first use, if spray unused for ≥30 days, or if cap left off bottle for ≥5 days. After each use, nozzle should be wiped with a clean, dry tissue. Once weekly, inside of cap should be cleaned with a clean, dry tissue.

Powder for oral inhalation: Flovent® Diskus®: Do not use with a spacer device. Do not exhale into Diskus®. Do not wash or take apart. Use in horizontal position. Mouth should be rinsed with water after use (do not swallow). Discard after 6 weeks once removed from protective pouch or when the dose counter reads “0”, whichever comes first (device is not reusable).

Administration: TopicalCream, lotion, ointment: Apply sparingly in a thin film. Rub in lightly. Unless otherwise directed by healthcare professional, do not use with occlusive dressing; do not use on children’s skin covered by diapers or plastic pants.

Dietary ConsiderationsFlovent® Diskus® contains lactose; very rare anaphylactic reactions have been reported in patients with severe milk protein allergy.

Storage

Nasal spray:

Flonase®: Store between 4°C to 30°C (39°F to 86°F).

Veramyst™: Store between 15°C to 30°C (59°F to 86°F); do not refrigerate or freeze. Store in upright position with cap on.

Avamys™ [CAN]: Store between 4°C to 30°C (39°F to 86°F); do not refrigerate or freeze. Store in upright position with cap on.

Oral inhalation:

Flovent® HFA: Store at 15°C to 30°C (59°F to 86°F). Discard device when the dose counter reads “000”. Store with mouthpiece down.

Flovent® Diskus®: Store at 20°C to 25°C (68°F to 77°F) in a dry place away from direct heat or sunlight. Discard after 6 weeks from removal from protective foil pouch or when the dose counter reads “0” (whichever comes first); device is not reusable.

Topical, cream: Store at 15°C to 30°C (59°F to 86°F).

Cutivate® lotion: Store at 15°C to 30°C (59°F to 86°F). do not refrigerate.

Cutivate® cream, ointment: Store at 2°C to 30°C (36°F to 86°F).

ContraindicationsHypersensitivity to fluticasone or any component of the formulation; primary treatment of status asthmaticus or acute bronchospasm

Topical: Do not use if infection is present at treatment site, in the presence of skin atrophy, or for the treatment of rosacea or perioral dermatitis

Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal suppression: May cause hypercorticism or suppression of hypothalamic-pituitary-adrenal (HPA) axis, particularly in younger children or in patients receiving high doses for prolonged periods. HPA axis suppression may lead to adrenal crisis. Withdrawal and discontinuation of a corticosteroid should be done slowly and carefully. Topical application may also cause suppression of HPA axis, especially when used on large areas of the body, denuded areas, for prolonged periods of time, or with an occlusive dressing. Pediatric patients may be more susceptible to systemic toxicity. Particular care is required when patients are transferred from systemic corticosteroids to inhaled products due to possible adrenal insufficiency or withdrawal from steroids, including an increase in allergic symptoms. Patients receiving ≥20 mg per day of prednisone (or equivalent) may be most susceptible. Concurrent use of ritonavir (and potentially other strong inhibitors of CYP3A4) may increase fluticasone levels and effects on HPA suppression. Fatalities have occurred due to adrenal insufficiency in asthmatic patients during and after transfer from systemic corticosteroids to aerosol steroids; aerosol steroids do **not** provide the systemic steroid needed to treat patients having trauma, surgery, or infections.

- Bronchospasm: May occur with wheezing after inhalation; if this occurs, stop steroid and treat with a fast-acting bronchodilator.

- Delayed wound healing: Avoid nasal corticosteroid use in patients with recent nasal septal ulcers, nasal surgery, or nasal trauma until healing has occurred.

- Immunosuppression: Prolonged use of corticosteroids may also increase the incidence of secondary infection, mask acute infection (including fungal infections), prolong or exacerbate viral infections, or limit response to vaccines. Exposure to chickenpox should be avoided; corticosteroids should not be used to treat ocular herpes simplex. Corticosteroids should not be used for cerebral malaria. Close observation is required in patients with latent tuberculosis (TB) and/or TB reactivity; restrict use in active TB (only in conjunction with antituberculosis treatment). With oral inhalation, local yeast infections (eg, oral pharyngeal candidiasis) may occur; patient should rinse mouth and spit after each use to reduce incidence. Lower respiratory tract infections, including pneumonia, have been reported in patients with COPD using the oral inhalation with an even higher incidence in the elderly.

- Kaposi's sarcoma: Prolonged treatment with corticosteroids has been associated with the development of Kaposi's sarcoma (case reports); if noted, discontinuation of therapy should be considered.

- Psychiatric disturbances: Corticosteroid use may cause psychiatric disturbances, including depression, euphoria, insomnia, mood swings, and personality changes. Pre-existing psychiatric conditions may be exacerbated by corticosteroid use.

- Vasculitis: Rare cases of vasculitis (Churg-Strauss syndrome) or other eosinophilic conditions can occur.

Disease-related concerns:

- Asthma: Supplemental steroids (oral or parenteral) may be needed during stress or severe asthma attacks. Not to be used in status asthmaticus or for the relief of acute bronchospasm.

- Cardiovascular disease: Use with caution in patients with HF; long-term use has been associated with fluid retention and hypertension.

- Diabetes: Use with caution in patients with diabetes mellitus; may alter glucose production/regulation leading to hyperglycemia.

- Gastrointestinal disease: Use with caution in patients with GI diseases (diverticulitis, peptic ulcer, ulcerative colitis) due to perforation risk.

- Hepatic impairment: Use with caution in patients with hepatic impairment, including cirrhosis; long-term use has been associated with fluid retention.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis; exacerbation of symptoms has occurred, especially during initial treatment with corticosteroids.

- Myocardial infarct (MI): Use with caution following acute MI; corticosteroids have been associated with myocardial rupture.

- Ocular disease: Use with caution in patients with cataracts and/or glaucoma; increased intraocular pressure, open-angle glaucoma, and cataracts have occurred with prolonged use. Consider routine eye exams in chronic users.

- Osteoporosis: Use with caution in patients with osteoporosis; high doses and/or long-term use of corticosteroids have been associated with increased bone loss and osteoporotic fractures.

- Renal impairment: Use with caution in patients with renal impairment; fluid retention may occur.

- Seizure disorders: Use with caution in patients with a history of seizure disorder; seizures have been reported with adrenal crisis.

- Thyroid disease: Changes in thyroid status may necessitate dosage adjustments; metabolic clearance of corticosteroids increases in hyperthyroid patients and decreases in hypothyroid ones.

Special populations:

- Pediatrics: Orally-inhaled and intranasal corticosteroids may cause a reduction in growth velocity in pediatric patients (~1 centimeter per year [range 0.3-1.8 cm per year] and related to dose and duration of exposure). To minimize the systemic effects of orally-inhaled and intranasal corticosteroids, each patient should be titrated to the lowest effective dose. Growth should be routinely monitored in pediatric patients. Safety and efficacy have not been established in children <4 years of age.

Dosage form specific issues:

- Flovent® Diskus®: Contains lactose; very rare anaphylactic reactions have been reported in patients with severe milk protein allergy.

Other warnings/precautions:

- Discontinuation of therapy: Withdraw systemic therapy with gradual tapering of dose. There have been reports of systemic corticosteroid withdrawal symptoms (eg, joint/muscle pain, lassitude, depression) when withdrawing oral inhalation therapy.

Geriatric ConsiderationsNo specific geriatric information is available. No differences in safety have been observed in the elderly when compared to younger patients. Based on current data, no dosage adjustment is needed based on age.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic events have been observed in some, but not all, animal studies. There are no adequate and well-controlled studies using inhaled fluticasone in pregnant women. Oral corticosteroid use has shown animals to be more prone to teratogenic effects than humans. Due to the natural increase in corticosteroid production during pregnancy, most women may require a lower steroid dose; use with caution.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsSystemic corticosteroids are excreted in human milk. The extent of topical absorption is variable. Use with caution while breast-feeding; do not apply to nipples.

Adverse Reactions

Oral inhalation (includes reactions from Flovent® HFA and Flovent® Diskus® trials):

>10%:

Central nervous system: Headache (2% to 14%)

Respiratory: Upper respiratory tract infection (14% to 21%), throat irritation (3% to 22%)

3% to 10%:

Central nervous system: Fever (1% to 7%)

Gastrointestinal: Oral candidiasis (≤9%), nausea/vomiting (1% to 8%), gastrointestinal infection (including viral; 1% to 5%), gastrointestinal discomfort/pain (1% to 4%)

Neuromuscular & skeletal: Musculoskeletal pain (2% to 5%), muscle injury (1% to 5%)

Respiratory: Sinusitis/sinus infection (4% to 10%), lower respiratory tract infections/pneumonia (1% to 7%; COPD diagnosis and age >65 years increase risk), cough (1% to 6%), bronchitis (≤8%), hoarseness/dysphonia (2% to 6%), upper respiratory tract inflammation (≤5%), viral respiratory infection (1% to 5%), rhinitis (1% to 4%)

Miscellaneous: Viral infection (≤5%)

1% to 3%:

Cardiovascular: Chest symptoms, edema, palpitation

Central nervous system: Cranial nerve paralysis, dizziness, fatigue, malaise, migraine, mood disorders, pain, sleep disorder

Dermatologic: Acne, dermatitis/dermatosis, eczema, folliculitis, photodermatitis, infection (fungal, viral), pruritus, rash, urticaria

Endocrine metabolic: Fluid disturbance, goiter, uric acid metabolism disturbance

Gastrointestinal: Abdominal discomfort/pain, appetite changes, dental discomfort/pain, diarrhea, dyspepsia, gastroenteritis, hyposalivation, oral discomfort/pain, oral erythema/rash, oral ulcerations, oropharyngeal plaques, tooth decay, weight gain

Genitourinary: Reproductive organ infections (bacterial), urinary tract infection

Hematologic: Hematoma

Hepatic: Cholecystitis

Neuromuscular & skeletal: Arthralgia, articular rheumatism, muscle cramps/spasms, muscle pain, muscle stiffness/tightness/rigidity, musculoskeletal inflammation

Ocular: Blepharoconjunctivitis, conjunctivitis, keratitis

Otic: Otitis

Respiratory: Epistaxis, hoarseness/dysphonia, laryngitis, nasal sinus disorder, pharyngitis/throat infection, rhinorrhea/postnasal drip, throat constriction

Miscellaneous: Infection (bacterial, fungal); injuries (including muscle, soft tissue); polyps (ear, nose, throat); tonsillitis

Postmarketing and/or case reports: Aggression, agitation, anaphylactic reaction (rare; Diskus®: some patients with severe milk allergy), angioedema, anxiety, aphonia, asthma exacerbation, behavioral changes (eg, hyperactivity and irritability in children; rare), bronchospasm (immediate and delayed), cataracts, chest tightness, Churg-Strauss syndrome, contusion, Cushingoid features, cutaneous hypersensitivity, depression, dyspnea, ecchymoses, eosinophilia, facial edema, growth velocity reduction in children/adolescents, HPA axis suppression, hyperglycemia, hypersensitivity reactions (immediate and delayed), oropharyngeal edema, osteoporosis, paradoxical bronchospasm, restlessness, throat soreness, vasculitis, wheeze

Nasal inhalation (includes reactions from Flonase®, Veramyst™, and Avamys™ [CAN] trials):

>10%: Central nervous system: Headache (7% to 16%)

1% to 10%:

Central nervous system: Dizziness (1% to 3%), fever (1% to 5%)

Gastrointestinal: Nausea/vomiting (3% to 5%), abdominal pain (1% to 3%), diarrhea (1% to 3%)

Neuromuscular & skeletal: Back pain (1%)

Respiratory: Pharyngitis (6% to 8%), epistaxis (4% to 7%), asthma symptoms (3% to 7%), cough (3% to 4%), pharyngolaryngeal pain (2% to 4%), blood in nasal mucous (1% to 3%), bronchitis (1% to 3%), runny nose (1% to 3%), nasal ulcer (1%)

Miscellaneous: Aches and pains (1% to 3%), flu-like syndrome (1% to 3%)

<1% and postmarketing reports: Alteration or loss of sense of taste and/or smell, anaphylaxis/anaphylactoid reactions, angioedema, AST increased, AV block (second degree), blurred vision, bronchospasm, cataracts, conjunctivitis, dry/irritated eyes, dry throat, dyspnea, edema (face and tongue), glaucoma, hoarseness, hypersensitivity reactions, increased intraocular pressure, nasal candidiasis, nasal septal perforation (rare), palpitations, pruritus, psychomotor hyperactivity, sinus congestion, skin rash, sore throat, throat irritation, tremor, urticaria, vaginal candidiasis, voice changes, wheezing

Topical: Pruritus (3%), skin irritation (3%), exacerbation of eczema (2%), dryness (1%), numbness of fingers (1%)

Reported with other topical corticosteroids (in decreasing order of occurrence): Irritation, folliculitis, acneiform eruptions, hypopigmentation, perioral dermatitis, allergic contact dermatitis, secondary infection, skin atrophy, striae, miliaria, pustular psoriasis from chronic plaque psoriasis

Metabolism/Transport Effects **Substrate** of CYP3A4 (major)

Drug Interactions

Amphotericin B: Corticosteroids (Orally Inhaled) may enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Antidiabetic Agents: Corticosteroids (Orally Inhaled) may diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Corticosteroids (Orally Inhaled). *Risk C: Monitor therapy*

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Loop Diuretics: Corticosteroids (Orally Inhaled) may enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the metabolism of Corticosteroids (Orally Inhaled). *Risk D: Consider therapy modification*

Thiazide Diuretics: Corticosteroids (Orally Inhaled) may enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions Herb/Nutraceutical: In theory, St John's wort may decrease serum levels of fluticasone by inducing CYP3A4 isoenzymes.

Monitoring Parameters Growth (adolescents and children); signs/symptoms of HPA axis suppression/adrenal insufficiency; possible eosinophilic conditions (including Churg-Strauss syndrome); FEV_1, peak flow, and/or other pulmonary function tests; asthma symptoms

Nursing: Physical Assessment/Monitoring Monitor effectiveness of therapy and adverse reactions at beginning of therapy and periodically with long-term use. May take as long as 2 weeks before full benefit of medication is known. Encourage regular eye exams with long-term use. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report. Monitor for possible eosinophilic conditions (including Churg-Strauss syndrome); growth (adolescents and children); and signs/symptoms of HPA axis suppression/adrenal insufficiency.

Patient Education Use as directed; do not overuse and use only for length of time prescribed. Although you may see improvement within a few hours of use, the full benefit of the medication may not be achieved for several days. Do not change the prescribed dosage without consulting prescriber. Avoid exposure to chickenpox or measles. If exposed, inform your prescriber as soon as possible. May cause headache. Report signs of infection or change in vision to prescriber. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Metered-dose inhalation: Sit when using. Take deep breaths for 3-5 minutes, and clear nasal passages before administration (use decongestant as needed). Hold breath for 5-10 seconds after use, and wait 1-3 minutes between inhalations. Follow package insert instructions for use. Do not exceed maximum dosage. If also using inhaled bronchodilator, use before fluticasone. Rinse mouth and throat after use to reduce aftertaste and prevent candidiasis.

Nasal spray: Shake gently before use. Use at regular intervals, no more frequently than directed. Report unusual cough or spasm; persistent nasal bleeding, burning, or irritation; or worsening of condition.

Powder for oral inhalation: Flovent® Diskus®: Do not attempt to take device apart. Do not use with a spacer device. Do not exhale into the Diskus®; use in a level horizontal position. Do not wash the mouthpiece.

Topical: For external use only. Apply thin film to affected area only; rub in lightly. Do not apply occlusive covering unless advised by prescriber. Wash hand thoroughly after use; avoid contact with eyes. Notify prescriber if skin condition persists or worsens. Do not use for treatment of diaper dermatitis or under diapers or plastic pants.

⇧ Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Aerosol for oral inhalation, as propionate [CFC free]:

- Flovent® HFA: 44 mcg/inhalation (10.6 g) [120 metered actuations]
- Flovent® HFA: 110 mcg/inhalation (12 g) [120 metered actuations]
- Flovent® HFA: 220 mcg/inhalation (12 g) [120 metered actuations]

Cream, as propionate: 0.05% (15 g, 30 g, 60 g)

- Cutivate®: 0.05% (30 g, 60 g)

Lotion, as propionate:

- Cutivate®: 0.05% (120 mL)

Ointment, as propionate: 0.005% (15 g, 30 g, 60 g)

- Cutivate®: 0.005% (30 g, 60 g)

Powder for oral inhalation, as propionate:

- Flovent® Diskus® [U.S.]: 50 mcg (60s) [contains lactose; prefilled blister pack]
- Flovent® Diskus® [CAN]: 50 mcg (28s, 60s) [contains lactose; prefilled blister pack] [not available in the U.S.]
- Flovent® Diskus® [CAN]: 100 mcg (28s, 60s) [contains lactose; prefilled blister pack] [not available in the U.S.]
- Flovent® Diskus® [CAN]: 250 mcg (28s, 60s) [contains lactose; prefilled blister pack] [not available in the U.S.]
- Flovent® Diskus® [CAN]: 500 mcg (28s, 60s) [contains lactose; prefilled blister pack] [not available in the U.S.]

Suspension, intranasal, as furoate [spray]:

- Avamys™ [CAN]: 27.5 mcg/inhalation (4.5 g) [30 metered actuations; contains benzalkonium chloride]; (10 g) [120 metered actuations; contains benzalkonium chloride] [not available in the U.S.]
- Veramyst™: 27.5 mcg/inhalation (10 g) [120 metered actuations; contains benzalkonium chloride]

Suspension, intranasal, as propionate [spray]: 50 mcg/inhalation (16 g) [120 metered actuations]

- Flonase®: 50 mcg/inhalation (16 g) [120 metered actuations; contains benzalkonium chloride]

⇧ Generic AvailableYes: Cream, nasal spray, ointment
⇧ Pricing: U.S. (www.drugstore.com)

Aerosol (Flovent HFA)

- 44 mcg/ACT (10.6): $95.95

Suspension (Veramyst)

27.5 mcg/spray (10): $85.99

Mechanism of ActionFluticasone belongs to a group of corticosteroids which utilizes a fluorocarbothioate ester linkage at the 17 carbon position; extremely potent vasoconstrictive and anti-inflammatory activity; has a weak HPA inhibitory potency when applied topically, which gives the drug a high therapeutic index. The effectiveness of inhaled fluticasone is due to its direct local effect. The mechanism of action for all topical corticosteroids is believed to be a combination of three important properties: anti-inflammatory activity, immunosuppressive properties, and antiproliferative actions.

Pharmacodynamics/Kinetics

Onset of action: Intranasal: Maximal benefit may take several days

Flovent® HFA, Flovent® Diskus®: Maximal benefit may take 1-2 weeks or longer

Absorption:

Topical cream: 5% (increased with inflammation)

Oral inhalation: Absorbed systemically (Flovent® Diskus®: ~18%) primarily via lungs, minimal GI absorption (<1%) due to presystemic metabolism

Distribution: Propionate: 4.2 L/kg

Protein binding: 91% to 99%

Metabolism: Hepatic via CYP3A4 to 17β-carboxylic acid (negligible activity)

Bioavailability: Nasal: ≤2%; Oral inhalation: (~18% to 21%)

Excretion: Feces (as parent drug and metabolites); urine (<5% as metabolites)

Related Information

- Asthma

- Inhalant Agents
- Status Epilepticus

Pharmacotherapy PearlsEffects of inhaled/intranasal steroids on growth have been observed in the absence of laboratory evidence of HPA axis suppression, suggesting that growth velocity is a more sensitive indicator of systemic corticosteroid exposure in pediatric patients than some commonly used tests of HPA axis function. The long-term effects of this reduction in growth velocity associated with orally-inhaled and intranasal corticosteroids, including the impact on final adult height, are unknown. The potential for "catch up" growth following discontinuation of treatment with inhaled corticosteroids has not been adequately studied. The product labeling notes that intranasal administration was not associated with a statistically-significant reduction in growth velocity (based on a small study conducted over 1 year).

In the United States, dosage for the metered dose inhaler (Flovent® HFA) is expressed as the amount of drug which leaves the actuater and is delivered to the patient. This differs from other countries, which express the dosage as the amount of drug which leaves the valve.

Dental Health: Effects on Dental TreatmentLocalized infections with *Candida albicans* or *Aspergillus niger* have occurred frequently in the mouth and pharynx with repetitive use of oral inhaler of corticosteroids. These infections may require treatment with appropriate antifungal therapy or discontinuance of treatment with corticosteroid inhaler.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause agitation, aggression, anxiety, depression, hyperactivity, irritability, and restlessness

Mental Health: Effects on Psychiatric TreatmentNone reported

Anesthesia and Critical Care Concerns/Other Considerations

Surgery: For patients who have received oral systemic corticosteroids during the past 6 months and for selected patients on long-term, high-dose, inhaled corticosteroid (ICS), give stress doses of hydrocortisone intravenously during the surgical period and reduce the dose rapidly within 24 hours after surgery (Expert Panel Report 3, 2007). Clinically important adrenal suppression has been reported in patients receiving high doses of an ICS, particularly children.

Index TermsFluticasone Furoate; Fluticasone Propionate

HMG-CoA Reductase Inhibitors: Evidence Does Not Suggest Increased Incidence of Amyotrophic Lateral Sclerosis (ALS) - Results of FDA Analysis - September 30, 2008

The U.S. Food and Drug Administration's (FDA) review of 41 long-term controlled clinical trials of HMG-CoA reductase inhibitors finds no evidence of an increased incidence of ALS (also known as Lou Gehrig's disease) related to these medications. This analysis occurred after the FDA had received notice of numerous adverse events of which 109 of these reports mentioned ALS, Lou Gehrig's disease, or motor neurone disease. The clinical trials included in the analysis had a median duration of treatment of 3.3 years (range of duration: 6 months to 5 years) and involved 120,964 patients. The analysis identified a total of 19 cases of ALS – 9 cases per 64,602 patients (0.014%) with statin therapy and 10 cases per 56,362 patients (0.017%) with placebo. The incidence rates, based on approximately 400,000 person-years, were 4.2 per 100,000 person-years in the statin-treated group and 5 per 100,000 person-years in the placebo-treated group.

The FDA recommends that health care providers continue to prescribe, and patients continue to use these products as described within their labeling.

For more information, healthcare professionals may refer to the following:

http://www.fda.gov/medwatch/safety/2008/safety08.htm#Statin

Medication Safety Issues

Sound-alike/look-alike issues:

Fluvastatin may be confused with fluoxetine

Pronunciation(FLOO va sta tin)

U.S. Brand NamesLescol®; Lescol® XL

Canadian Brand NamesLescol®; Lescol® XL

Pharmacologic CategoryAntilipemic Agent, HMG-CoA Reductase Inhibitor

Use: Labeled IndicationsTo be used as a component of multiple risk factor intervention in patients at risk for atherosclerosis vascular disease due to hypercholesterolemia

Adjunct to dietary therapy to reduce elevated total cholesterol (total-C), LDL-C, triglyceride, and apolipoprotein B (apo-B) levels and to increase HDL-C in primary hypercholesterolemia and mixed dyslipidemia (Fredrickson types IIa and IIb); to slow the progression of coronary atherosclerosis in patients with coronary heart disease; reduce risk of coronary revascularization procedures in patients with coronary heart disease

Dosing: Adults

Dyslipidemia (also delay in progression of CAD): Oral:

Patients requiring ≥25% decrease in LDL-C: 40 mg capsule once daily in the evening, 80 mg extended release tablet once daily (anytime), or 40 mg capsule twice daily

Patients requiring <25% decrease in LDL-C: Initial: 20 mg capsule once daily in the evening; may increase based on tolerability and response to a maximum recommended dose of 80 mg/day, given in 2 divided doses (immediate release capsule) or as a single daily dose (extended release tablet)

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Heterozygous familial hypercholesterolemia: Adolescents 10-16 years: Oral: Initial: 20 mg once daily; may increase every 6 weeks based on tolerability and response to a maximum recommended dose of 80 mg/day, given in 2 divided doses (immediate release capsule) or as a single daily dose (extended release tablet)

Note: Indicated only for adjunctive therapy when diet alone cannot reduce LDL-C below 190 mg/dL, or 160 mg/dL (with cardiovascular risk factors). Female patients must be 1 year postmenarche.

Dosing: Renal ImpairmentLess than 6% is excreted renally. No dosage adjustment needed with mild-to-moderate renal impairment; use with caution in severe impairment.

Dosing: Hepatic ImpairmentLevels may accumulate in patients with liver disease (increased AUC and C_{max}). Use caution with severe hepatic impairment or heavy ethanol ingestion. Contraindicated in active liver disease or unexplained transaminase elevations. Decrease dose and monitor effects carefully in patients with hepatic insufficiency.

Administration: OralPatient should be placed on a standard cholesterol-lowering diet before and during treatment. Fluvastatin may be taken without regard to meals. Adjust dosage as needed in response to periodic lipid determinations during the first 4 weeks after a dosage change; lipid-lowering effects are additive when fluvastatin is combined with a bile-acid binding resin or niacin, however, it must be administered at least 2 hours following these drugs. Do not break, chew, or crush extended release tablets; do not open capsules.

Dietary ConsiderationsGenerally, patients should be placed on a standard cholesterol-lowering diet and other lifestyle modifications for 3-6 months prior to the initiation of drug therapy. The diet should be continued during drug therapy. However, for patients with advanced risk factors (eg, known coronary heart disease), drug therapy may be initiated concurrently with diet modification. May be taken without regard to meals. Red yeast rice contains an estimated 2.4 mg lovastatin per 600 mg rice.

StorageStore at 15°C to 30°C (59°F to 86°F). Protect from light.

ContraindicationsHypersensitivity to fluvastatin or any component of the formulation; active liver disease; unexplained persistent elevations of serum transaminases; pregnancy; breast-feeding

Allergy Considerations

- HMG-CoA Reductase Inhibitor Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Myopathy/rhabdomyolysis: Patients receiving HMG-CoA reductase inhibitors have developed rhabdomyolysis with acute renal failure and/or myopathy; patients should be monitored closely. This risk is dose related and is increased with concurrent use of other lipid-lowering medications. Temporarily discontinue for elective major surgery, acute medical or surgical conditions, or in any patient experiencing an acute or serious condition predisposing to renal failure (eg, sepsis, hypotension, trauma, uncontrolled seizures). Based upon current evidence, HMG-CoA reductase inhibitor therapy should be continued in the perioperative period unless risk outweighs cardioprotective benefit. Use caution in patients with renal impairment, inadequately treated hypothyroidism, and those taking other drugs associated with myopathy (eg, colchicine); these patients are predisposed to myopathy. Patients should be instructed to report unexplained muscle pain, tenderness, weakness, or brown urine.

Disease-related concerns:

- Diseases reducing steroidogenesis: Use caution in patients with conditions or on medications that reduce steroidogenesis.

- Hepatic impairment and/or ethanol use: Use with caution in patients who consume large amounts of ethanol or have a history of liver disease.

Special populations:

- Elderly: Use with caution in patients with advanced age; these patients are predisposed to myopathy.

- Pediatrics: Treatment in patients <18 years of age is not recommended.

Other warnings/precautions:

- Hyperlipidemia: Secondary causes of hyperlipidemia should be ruled out prior to therapy.

- Liver function tests: Must be monitored by periodic laboratory assessment.

Geriatric ConsiderationsThe definition of and, therefore, when to treat hyperlipidemia in the elderly is a controversial issue. The National Cholesterol Education Program recommends that all adults maintain a plasma cholesterol <160 mg/dL. In elderly patients with one additional risk factor, goal LDL would decrease to <130 mg/dL. Pharmacologic treatment should be reserved for those who are unable to obtain a desirable plasma cholesterol concentration by diet alone and for whom the benefits of treatment are believed to outweigh the potential adverse effects, drug interactions, and cost of treatment.

Pregnancy Risk FactorX

Pregnancy ConsiderationsCholesterol biosynthesis may be important in fetal development. Contraindicated in pregnancy. Administer to women of childbearing potential only when conception is highly unlikely and patients have been informed of potential hazards.

LactationEnters breast milk/contraindicated

Breast-Feeding ConsiderationsFluvastatin is excreted in human breast milk (milk plasma ratio 2:1); do not use in breast-feeding women.

Adverse ReactionsAs reported with fluvastatin capsules; in general, adverse reactions reported with fluvastatin extended release tablet were similar, but the incidence was less.

1% to 10%:

Central nervous system: Headache (9%), fatigue (3%), insomnia (3%)

Gastrointestinal: Dyspepsia (8%), diarrhea (5%), abdominal pain (5%), nausea (3%)

Genitourinary: Urinary tract infection (2%)

Neuromuscular & skeletal: Myalgia (5%)

Respiratory: Sinusitis (3%), bronchitis (2%)

<1% including additional class-related events (not necessarily reported with fluvastatin therapy) and postmarketing case reports: Alkaline phosphatase increased, alopecia, anaphylaxis, angioedema, anorexia, anxiety, arthralgia, arthritis, blurred vision, cataracts, chills, cholestatic jaundice, cirrhosis, CPK increased (>10x normal), depression, dermatomyositis, dizziness, dryness of skin/mucous membranes,

dyspnea, eosinophilia, erectile dysfunction, erythema multiforme, ESR increased, extraocular muscle movement impaired, facial paresis, fatty liver, fever, flushing, fulminant hepatic necrosis, GGT increased, gynecomastia, hemolytic anemia, hepatitis, hepatoma, hyperbilirubinemia, hypersensitivity reaction, impotence, leukopenia, libido decreased, malaise, memory loss, muscle cramps, myopathy, nail changes, nodules, ophthalmoplegia, pancreatitis, paresthesia, peripheral nerve palsy, peripheral neuropathy, photosensitivity, polymyalgia, positive ANA, pruritus, psychic disturbance, purpura, rash, renal failure (secondary to rhabdomyolysis), rhabdomyolysis, rheumatica, skin discoloration, Stevens-Johnson syndrome, systemic lupus erythematosus-like syndrome, taste alteration, thrombocytopenia, thyroid dysfunction, toxic epidermal necrolysis, transaminases increased, tremor, urticaria, vasculitis, vertigo, vomiting

Metabolism/Transport Effects**Substrate** of CYP2C9 (major), 2C8 (minor), 2D6 (minor), 3A4 (minor); **Inhibits** CYP1A2 (weak), 2C8 (weak), 2C9 (moderate), 2D6 (weak), 3A4 (weak)

Drug Interactions

Amiodarone: May decrease the metabolism of HMG-CoA Reductase Inhibitors. Management: Dose of HMG-CoA reductase inhibitor may need to be reduced (e.g., simvastatin prescribing information recommends not exceeding 20 mg/day during concurrent therapy). *Risk D: Consider therapy modification*

Colchicine: May enhance the myopathic (rhabdomyolysis) effect of HMG-CoA Reductase Inhibitors. Colchicine may increase the serum concentration of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Moderate) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

DAPTOmycin: HMG-CoA Reductase Inhibitors may enhance the adverse/toxic effect of DAPTOmycin. Specifically, the risk of skeletal muscle toxicity may be increased. Management: Consider temporarily stopping HMG-CoA reductase inhibitor therapy prior to daptomycin. If used together, regular (i.e., at least weekly) monitoring of CPK concentrations is recommended. *Risk D: Consider therapy modification*

Etravirine: May decrease the serum concentration of HMG-CoA Reductase Inhibitors. This applies to atorvastatin, lovastatin and simvastatin. Conversely, levels of fluvastatin may be increased. Management: Dose adjustment of the HMG-CoA reductase inhibitor may be warranted. No interaction is expected with rosuvastatin or pravastatin. *Risk C: Monitor therapy*

Fenofibrate: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Niacin: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Niacinamide: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Phenytoin: May increase the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May increase the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): HMG-CoA Reductase Inhibitors may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid excessive ethanol consumption (due to potential hepatic effects).

Food: Reduces rate but not the extent of absorption. Red yeast rice contains an estimated 2.4 mg lovastatin per 600 mg rice.

Monitoring ParametersObtain baseline LFTs and total cholesterol profile; repeat tests at 12 weeks after initiation of therapy or elevation in dose, and periodically thereafter. Monitor LDL-C at intervals no less than 4 weeks.

Nursing: Physical Assessment/MonitoringEvaluate/rule out secondary causes of hyperlipidemia prior to beginning therapy. Assess potential for interactions with other pharmacological agents or herbal products patient may be taking (eg, increased risk of rhabdomyolysis, acute renal failure). Assess results of laboratory tests (eg, LFTs and cholesterol profile) at baseline, when changing dosage and periodically thereafter. Monitor therapeutic effectiveness (reduced hyperlipemia) and adverse response (eg, myalgia, gastrointestinal disturbances; see Adverse Reactions) on a regular basis throughout therapy. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report. **Pregnancy risk factor X:** Determine that patient is not pregnant before starting therapy. Do not give to sexually-active female patients unless capable of complying with effective contraceptive use. Instruct patient in appropriate contraceptive measures. Breast-feeding is contraindicated.

Monitoring: Lab TestsObtain baseline LFTs and total cholesterol profile. Repeat tests at 12 weeks after initiation of therapy or elevation in dose, and periodically thereafter. Monitor LDL-C at intervals no less than 4 weeks.

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber. Take as directed, with or without food. If also taking other chloesterol-lowering medication, check with prescriber for appropriate timing. Do not chew, crush, or dissolve extended release tablets; swallow whole. Follow diet and exercise regimen as prescribed. You will need periodic laboratory tests to evaluate response. You may experience nausea or dyspepsia (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); diarrhea (buttermilk, boiled milk, or yogurt may help); or headache (consult prescriber for approved analgesic). Report muscle pain or cramping; tremor; CNS changes (eg, memory loss, depression, personality changes; numbness, weakness, tingling, pain in extremities); or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Consult prescriber for instruction on appropriate contraceptive measures. This drug may cause severe fetal defects. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule (Lescol®): 20 mg, 40 mg

Tablet, extended release (Lescol® XL): 80 mg

Generic AvailableNo

ManufacturerNovartis Pharmaceuticals Corp

Pricing: U.S. (www.drugstore.com)

Capsules (Lescol)

20 mg (30): $85.99

40 mg (30): $83.51

Tablet, 24-hour (Lescol XL)

80 mg (30): $105.49

Mechanism of ActionActs by competitively inhibiting 3-hydroxyl-3-methylglutaryl-coenzyme A (HMG-CoA) reductase, the enzyme that catalyzes the reduction of HMG-CoA to mevalonate; this is an early rate-limiting step in cholesterol biosynthesis. HDL is increased while total, LDL, and VLDL cholesterols; apolipoprotein B; and plasma triglycerides are decreased.

Pharmacodynamics/Kinetics

Onset of action: Peak effect: Maximal LDL-C reductions achieved within 4 weeks

Distribution: V_d: 0.35 L/kg

Protein binding: >98%

Metabolism: To inactive and active metabolites (oxidative metabolism via CYP2C9 [75%], 2C8 [~5%], and 3A4 [~20%] isoenzymes); active forms do not circulate systemically; extensive (saturable) first-pass hepatic extraction

Bioavailability: Absolute: Capsule: 24%; Extended release tablet: 29%

Half-life elimination: Capsule: <3 hours; Extended release tablet: 9 hours

Time to peak: Capsule: 1 hour; Extended release tablet: 3 hours

Excretion: Feces (90%): urine (5%)

Mental Health: Effects on Mental StatusMay cause dizziness, insomnia, or drowsiness

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular Considerations

HMG-CoA reductase inhibitors are effective in primary and secondary prevention of cardiovascular events in patients with hyperlipidemia. For primary prevention, a patient's major risk factors (cigarette smoking, hypertension or currently taking antihypertensives, low HDL-C, family history, age, gender) should be evaluated. Patients with multiple risk factors (≥2) require more intensive therapy guided by the calculation of a 10-year absolute CHD risk (eg, the percent probability of having a CHD event in next 10 years). An individual's 10-year absolute CHD risk can be calculated at www.med-decisions.com/cvtool/phys/phys.html. LDL cholesterol goals, therapeutic lifestyle changes, and drug therapy are determined based upon a patient's risk factor profile.

Primary prevention trials show that cholesterol-lowering drugs reduce the risk of major coronary events, coronary death, and cerebrovascular events even in the first 6-12 months of use. The WOSCOP trial suggested a trend towards enhanced survival using pravastatin in their patients (mean LDL-cholesterol of 192 mg/dL and no history of MI). In a recent trial (Sever, 2003), patients with HTN and at least three other risk factors were randomized to 10 mg daily of atorvastatin or placebo. These patients had a total nonfasting cholesterol <250 mg/dL before treatment. LDL-C levels were 132 mg/dL before treatment and fell to an average of 90 mg/dL in the atorvastatin-treated group. There was a significant reduction in stroke, cardiovascular events, and coronary events in the atorvastatin-treated group as compared to the placebo group. There was no difference in mortality between the groups.

Secondary prevention trials indicate that “statin” therapy reduces mortality, major coronary events, coronary artery procedures, and stroke. The Heart Protection Study proved that lowering serum cholesterol levels reduces the rate of major vascular events among high-risk individuals with documented vascular disease (CHD, cerebrovascular, peripheral vascular) or diabetes regardless of initial cholesterol concentrations. PROVE IT is a randomized, double-blind trial evaluating hospitalized patients with acute coronary syndrome to determine the effects of intense LDL-C lowering therapy. Four thousand patients with an LDL-C levels of 106 mg/dL were randomized to pravastatin 40 mg daily or atorvastatin 80 mg daily. After 2 years, the combined cardiovascular endpoint (death, MI, unstable angina requiring hospitalization, revascularization and stroke) was ~26% in the pravastatin patients (median LDL-C 95 mg/dL) and ~22% in the atorvastatin treated patients (median LDL-C 62 mg/dL).

LaRosa and colleagues assessed the efficacy and safety of lowering LDL cholesterol <100 mg/dL in patients with stable coronary heart disease (LaRosa, 2005). Ten thousand and one patients with baseline LDL levels <130 mg/dL were randomized to atorvastatin 10 mg or 80 mg daily and followed for a median of 4.9 years. The primary endpoint was the occurrence of the first major cardiovascular event (death from CVD, MI, resuscitation after cardiac arrest, or stroke). A primary event occurred in 434 patients (8.7%) receiving 80 mg daily (mean LDL 77 mg/dL) and 548 patients (10.9%) receiving 10 mg dose (mean LDL 101 mg/dL) (95% CI, 0.69-0.89; p <0.001). There was no mortality difference between the two treatment groups.

HMG-CoA reductase inhibitors decrease levels of high-sensitivity C-reactive protein (hs-CRP). They also possess pleiotropic properties including improved endothelial function, reduced inflammation at the site of the coronary plaque, inhibition of platelet aggregation, and anticoagulant effects. These nonlipid effects may be beneficial when HMG-CoA reductase inhibitors are introduced early in the management of acute coronary syndromes (de Denus, 2002).

Myopathy: Currently-marketed HMG-CoA reductase inhibitors appear to have a similar potential for causing myopathy. Incidence of severe myopathy is about 0.08% to 0.09%. The factors that increase risk include advanced age (especially >80 years of age), women more frequently than men, small body frame, frailty, multisystem disease (eg, chronic renal insufficiency especially due to diabetes), multiple medications, drug interactions (use with caution or avoid). The combination of a HMG-CoA reductase inhibitor plus nicotinic acid seems to carry a lower risk of myopathy than does a HMG-CoA reductase inhibitor plus a fibrate. Other medications, when used concurrently, may enhance the risk of myopathy associated with statins; these include drugs that inhibit CYP3A4 isoenzymes (lovastatin, simvastatin, atorvastatin) or CYP2C9 isoenzymes (fluvastatin). HMG-CoA reductase inhibitors may exacerbate exercise-induced skeletal muscle injury. Many experts favor getting a baseline creatine kinase (CK) measurement before initiating therapy (asymptomatic CK elevations are common). Obtain a CK measurement if patient complains of muscle soreness, tenderness, or pain.

Anesthesia and Critical Care Concerns/Other Considerations**Myopathy:** Currently-marketed HMG-CoA reductase inhibitors appear to have a similar potential for causing myopathy. Incidence of severe myopathy is about 0.08% to 0.09%. The factors that increase risk include advanced age (especially >80 years), gender (occurs in women more frequently than men), small body frame, frailty, multisystem disease (eg, chronic renal insufficiency especially due to diabetes), multiple medications, and drug interactions (use with caution or avoid).

Based on current research, HMG-CoA reductase inhibitors should be continued in the perioperative period. Postoperative discontinuation of statin therapy is associated with an increased risk of cardiac morbidity and mortality.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Fluvoxamine may be confused with flavoxate, fluoxetine

Luvox may be confused with Lasix®, Levoxyl®, Lovenox®

Pronunciation(floo VOKS a meen)

U.S. Brand NamesLuvox® CR

Canadian Brand NamesAlti-Fluvoxamine; Apo-Fluvoxamine®; Luvox®; Novo-Fluvoxamine; Nu-Fluvoxamine; PMS-Fluvoxamine; Rhoxal-Fluvoxamine; Riva-Fluvoxamine; Sandoz-Fluvoxamine

Pharmacologic CategoryAntidepressant, Selective Serotonin Reuptake Inhibitor

Use: Labeled IndicationsTreatment of obsessive-compulsive disorder (OCD); treatment of social anxiety disorder

Use: Unlabeled/InvestigationalTreatment of major depression; panic disorder; anxiety disorders in children; treatment of mild dementia-associated agitation in nonpsychotic patients

Dosing: Adults

Obsessive-compulsive disorder: Oral:

Immediate release: Initial: 50 mg once daily at bedtime; may be increased in 50 mg increments at 4- to 7-day intervals, as tolerated; usual dose range: 100-300 mg/day; maximum dose: 300 mg/day. **Note:** When total daily dose exceeds 100 mg, the dose should be given in 2 divided doses with larger portion administered at bedtime.

Extended release: Initial: 100 mg once daily at bedtime; may be increased in 50 mg increments at intervals of at least 1 week; usual dosage range: 100-300 mg/day; maximum dose: 300 mg/day

Social anxiety disorder: Extended release: Initial: 100 mg once daily at bedtime; may be increased in 50 mg increments at intervals of at least 1 week; usual dosage range: 100-300 mg/day; maximum dose: 300 mg/day

Dosing: ElderlyReduce dose; titrate slowly. See Geriatric Considerations.

Dosing: Pediatric**Obsessive-compulsive disorder:** Oral:

Children 8-17 years: Immediate release: Initial: 25 mg once daily at bedtime; may be increased in 25 mg increments at 4- to 7-day intervals, as tolerated, to maximum therapeutic benefit; usual dose range: 50-200 mg/day. **Note:** When total daily dose of immediate release exceeds 50 mg, the dose should be given in 2 divided doses with larger portion administered at bedtime.

Maximum dose: Children: 8-11 years: 200 mg/day; Adolescents: 300 mg/day; lower doses may be effective in female versus male patients

Dosing: Hepatic ImpairmentReduce dose; titrate slowly.

Administration: OralMay be administered with or without food. Do not crush, open, or chew extended release capsules.

Dietary ConsiderationsMay be taken with or without food.

StorageProtect from high humidity and store at controlled room temperature 25°C (77°F).

RestrictionsAn FDA-approved medication guide concerning the use of antidepressants in children, adolescents, and young adults must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm. Dispense to parents or guardians of children and adolescents receiving this medication.

ContraindicationsHypersensitivity to fluvoxamine or any component of the formulation; concurrent use with alosetron, pimozide, thioridazine, or tizanidine; use with or within 14 days of MAO inhibitors

Allergy Considerations

- Selective Serotonin Reuptake Inhibitor (SSRI) Allergy

Warnings/Precautions

Boxed warnings:

- Suicidal thinking/behavior: See “Major psychiatric warnings” below.

Major psychiatric warnings:

- **[U.S. Boxed Warning]: Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 years of age) with major depressive disorder (MDD) and other psychiatric disorders;** consider risk prior to prescribing. Short-term studies did not show an increased risk in patients >24 years of age and showed a decreased risk in patients ≥65 years. Closely monitor patients for clinical worsening, suicidality, or unusual changes in behavior, particularly during the initial 1-2 months of therapy or during periods of dosage adjustments (increases or decreases); the patient's family or caregiver should be instructed to closely observe the patient and communicate condition with healthcare provider. A medication guide concerning the use of antidepressants should be dispensed with each prescription. **Fluvoxamine is FDA approved for the treatment of OCD in children ≥8 years of age; extended release capsules are not FDA approved for use in children.**

- The possibility of a suicide attempt is inherent in major depression and may persist until remission occurs. Patients treated with antidepressants should be observed for clinical worsening and suicidality, especially during the initial few months of a course of drug therapy, or at times of dose changes, either increases or decreases. Worsening depression and severe abrupt suicidality that are not part of the presenting symptoms may require discontinuation or modification of drug therapy. Use caution in high-risk patients during initiation of therapy.

- Prescriptions should be written for the smallest quantity consistent with good patient care. The patient's family or caregiver should be alerted to monitor patients for the emergence of suicidality and associated behaviors such as anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, and mania; patients should be instructed to notify their healthcare provider if any of these symptoms or worsening depression or psychosis occur.

- May worsen psychosis in some patients or precipitate a shift to mania or hypomania in patients with bipolar disorder. Monotherapy in patients with bipolar disorder should be avoided. Patients presenting with depressive symptoms should be screened for bipolar disorder. **Fluvoxamine is not FDA approved for the treatment of bipolar depression.**

Concerns related to adverse effects:

- Anticholinergic effects: Relatively devoid of these side effects.

- Bleeding risk: May impair platelet aggregation resulting in increased risk of bleeding events, particularly if used concomitantly with aspirin, NSAIDs, warfarin or other anticoagulants. Bleeding related to SSRI use has been reported to range from relatively minor bruising and epistaxis to life-threatening hemorrhage.

- CNS depression: Has a low potential to impair cognitive or motor performance; caution operating hazardous machinery or driving.

- Neuroleptic malignant syndrome (NMS): Use with or without concomitant antipsychotic therapy has been rarely associated with NMS; monitor for mental status changes, fever, muscle rigidity, and/or autonomic instability (risk may be increased in patients with Parkinson's disease or Lewy body dementia).

- Sexual dysfunction: May cause or exacerbate sexual dysfunction.

- SIADH and hyponatremia: SSRIs and SNRIs have been associated with the development of SIADH; hyponatremia has been reported rarely (including severe cases with serum sodium <110 mmol/L), predominately in the elderly. Volume depletion and/or concurrent use of diuretics likely increases risk.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease; fluvoxamine has not been systemically evaluated in patients with a recent history of MI or unstable heart disease.

- Hepatic impairment: Use with caution in patients with hepatic impairment; clearance is decreased and plasma concentrations are increased; a lower dosage may be needed.

- Seizure disorder: Use with caution in patients with a previous seizure disorder or condition predisposing to seizures such as brain damage or alcoholism.

Concurrent drug therapy issues:

- Agents which lower seizure threshold: Use caution with concurrent use of drugs which lower the seizure threshold.

- Alosetron: Fluvoxamine may significantly increase alosetron concentrations; concurrent use **contraindicated.**

- Anticoagulants/Antiplatelets: Use caution with concomitant use of NSAIDs, ASA, or other drugs that affect coagulation; the risk of bleeding may be potentiated.

- CNS depressants: Use caution with concomitant therapy.

- MAO inhibitors: Potential for severe reaction when used with MAO inhibitors; autonomic instability, coma, death, delirium, diaphoresis, hyperthermia, mental status changes/agitation, muscular rigidity, myoclonus, neuroleptic malignant syndrome features, and seizures may occur.

- Serotonin syndrome: Symptoms of agitation, confusion, hallucinations, hyper-reflexia, myoclonus, shivering, and tachycardia may occur with concomitant proserotonergic drugs (ie, SSRIs/SNRIs or triptans) or agents which reduce fluvoxamine's metabolism. Concurrent use of serotonin precursors (eg, tryptophan) is not recommended.

- Thioridazine and pimozide: Potential for QT_c prolongation and arrhythmia; concurrent use of fluvoxamine with either of these agents is **contraindicated.**

- Tizanidine: Concomitant use may cause a significant decrease in blood pressure and increase in drowsiness; concurrent use is **contraindicated.**

Special populations:

- Elderly: Use caution in elderly patients; clearance may be decreased and half-life may be increased compared to younger adults. Risk of hyponatremia and other adverse events may be increased.

- Smokers: Fluvoxamine levels may be lower in patients who smoke.

Other warnings/precautions:

- Electroconvulsive therapy: May increase the risks associated with electroconvulsive therapy; consider discontinuing, when possible, prior to ECT treatment.
- Withdrawal syndrome: May cause dysphoric mood, irritability, agitation, dizziness, sensory disturbances, anxiety, confusion, headache, lethargy, emotional lability, insomnia, hypomania, tinnitus, and seizures. Upon discontinuation of fluvoxamine therapy, gradually taper dose. If intolerable symptoms occur following a decrease in dosage or upon discontinuation of therapy, then resuming the previous dose with a more gradual taper should be considered.

Geriatric Considerations Given fluvoxamine's approved indication (OCD), the number of drug interactions, and the limited information available on its use in the elderly, it may be best to select a different agent when treating depression. The elderly are more prone to SSRI/SNRI-induced hyponatremia.

Pregnancy Risk Factor C

Pregnancy Considerations Due to adverse effects observed in animal studies, fluvoxamine is classified as pregnancy category C. Fluvoxamine crosses the human placenta. Nonteratogenic effects in the newborn following SSRI exposure late in the third trimester include respiratory distress, cyanosis, apnea, seizures, temperature instability, feeding difficulty, vomiting, hypoglycemia, hypo- or hypertonia, hyperreflexia, jitteriness, irritability, constant crying, and tremor. An increased risk of low birth weight and low APGAR scores has also been reported. Exposure to SSRIs after the twentieth week of gestation has been associated with persistent pulmonary hypertension of the newborn (PPHN). Adverse effects may be due to toxic effects of the SSRI or drug withdrawal due to discontinuation. The long-term effects of *in utero* SSRI exposure on infant development and behavior are not known.

Women treated for major depression and who are euthymic prior to pregnancy are more likely to experience a relapse when medication is discontinued as compared to pregnant women who continue taking antidepressant medications. The ACOG recommends that therapy with SSRIs or SNRIs during pregnancy be individualized; treatment of depression during pregnancy should incorporate the clinical expertise of the mental health clinician, obstetrician, primary healthcare provider, and pediatrician (ACOG, 2007). If treatment during pregnancy is required, consider tapering therapy during the third trimester in order to prevent withdrawal symptoms in the infant. If this is done and the woman is considered to be at risk from her major depressive disorder, the medication can be restarted following delivery, although the dose should be readjusted to that required before pregnancy.

Lactation Enters breast milk/consider risk:benefit (AAP rates “of concern”)

Breast-Feeding Considerations Fluvoxamine is excreted in breast milk. Based on case reports, the dose the infant receives is relatively small and adverse events have not been observed. According to the manufacturer, the decision to continue or discontinue breast-feeding during therapy should take into account the risk of exposure to the infant and the benefits of treatment to the mother. The AAP considers fluvoxamine to be a "drug for which the effect on the nursing infant is unknown, but may be of concern."

The long-term effects on development and behavior have not been studied; therefore, fluvoxamine should be prescribed to a mother who is breast-feeding only when the benefits outweigh the potential risks.

Adverse Reactions Frequency varies by dosage form and indication. Adverse reactions reported as a composite of all indications.

>10%:

Central nervous system: Headache (22% to 35%), insomnia (21% to 35%), somnolence (22% to 27%), dizziness (11% to 15%), nervousness (10% to 12%)

Gastrointestinal: Nausea (34% to 40%), diarrhea (11% to 18%), xerostomia (10% to 14%), anorexia (6% to 14%)

Genitourinary: Ejaculation abnormal (8% to 11%)

Neuromuscular & skeletal: Weakness (14% to 26%)

1% to 10%:

Cardiovascular: Chest pain (3%), palpitation (3%), vasodilation (2% to 3%), hypertension (1% to 2%), edema (≤1%), hypotension (≤1%), syncope (≤1%), tachycardia (≤1%)

Central nervous system: Pain (10%), anxiety (5% to 8%), abnormal dreams (3%), abnormal thinking (3%), agitation (2% to 3%), apathy (≥1% to 3%), chills (2%), CNS stimulation (2%), depression (2%), neurosis (2%), amnesia, malaise, manic reaction, psychotic reaction

Dermatologic: Bruising (4%), acne (2%)

Endocrine & metabolic: Libido decreased (2% to 10%; incidence higher in males), anorgasmia (2% to 5%), sexual function abnormal (2% to 4%), menorrhagia (3%)

Gastrointestinal: Dyspepsia (8% to 10%), constipation (4% to 10%), vomiting (4% to 6%), abdominal pain (5%), flatulence (4%), taste perversion (2% to 3%), tooth disorder (2% to 3%), dysphagia (2%), gingivitis (2%), weight loss (≤1% to 2%), weight gain

Genitourinary: Polyuria (2% to 3%), impotence (2%), urinary tract infection (2%), urinary retention (1%)

Hepatic: Liver function tests abnormal (≥1% to 2%)

Neuromuscular & skeletal: Tremor (5% to 8%), myalgia (5%), paresthesia (3%), hypertonia (2%), twitching (2%), hyper-/hypokinesia, myoclonus

Ocular: Amblyopia (2% to 3%)

Respiratory: Upper respiratory infection (9%), pharyngitis (6%), yawn (2% to 5%), laryngitis (3%), bronchitis (2%), dyspnea (2%), epistaxis

(2%), cough increased, sinusitis

Miscellaneous: Diaphoresis (6% to 7%), flu-like syndrome (3%), viral infection (2%)

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Acute renal failure, agranulocytosis, akinesia, allergic reaction, amenorrhea, anaphylactic reaction, anemia, angina, angioedema, anuria, aplastic anemia, apnea, asthma, ataxia, AV block, bradycardia, bullous eruption, cardiomyopathy, cerebrovascular accident, cholecystitis, cholelithiasis, colitis, conduction delay, coronary artery disease, deafness, delirium, diplopia, dyskinesia, dystonia, extrapyramidal syndrome, embolus, GI bleeding, goiter, hallucinations, heart failure, hematemesis, hematuria, Henoch-Schönlein purpura, hepatitis, hemoptysis, hypercholesterolemia, hyper-/hypoglycemia, hypokalemia, hyponatremia, hypothyroidism, ileus, intestinal obstruction, jaundice, laryngismus, leukopenia, leukocytosis, lymphadenopathy, melena, MI, myasthenia, myopathy, neuralgia, neuroleptic malignant syndrome, neuropathy, pancreatitis, paralysis, pericarditis, porphyria, priapism, purpura, retinal detachment, serotonin syndrome, ST segment changes, seizure, Stevens-Johnson syndrome, suicidal tendencies, supraventricular extrasystoles, tardive dyskinesia, thrombocytopenia, toxic epidermal necrolysis, vasculitis, ventricular tachycardia (including torsade de pointes)

Metabolism/Transport Effects **Substrate** (major) of CYP1A2, 2D6; **Inhibits** CYP1A2 (strong), 2B6 (weak), 2C9 (weak), 2C19 (strong), 2D6 (weak), 3A4 (weak)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alosetron: Fluvoxamine may decrease the metabolism of Alosetron. *Risk X: Avoid combination*

Analgesics (Opioid): May enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Anticoagulants: Antiplatelet Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Serotonin Reuptake Inhibitor/Antagonist): Selective Serotonin Reuptake Inhibitors may enhance the serotonergic effect of Antidepressants (Serotonin Reuptake Inhibitor/Antagonist). This may cause serotonin syndrome. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the anticoagulant effect of other Antiplatelet Agents. *Risk C: Monitor therapy*

Aspirin: Selective Serotonin Reuptake Inhibitors may enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Bendamustine: CYP1A2 Inhibitors (Strong) may increase the serum concentration of Bendamustine. Concentrations of the active metabolites of bendamustine may be decreased. *Risk C: Monitor therapy*

Benzodiazepines (metabolized by oxidation): Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

BusPIRone: May enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. Selective Serotonin Reuptake Inhibitors may decrease the metabolism of BusPIRone. *Risk C: Monitor therapy*

CarBAMazepine: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of CarBAMazepine. Specifically those SSRIs that inhibit CYP3A4 isoenzymes. CarBAMazepine may increase the metabolism of Selective Serotonin Reuptake Inhibitors. Specifically those agents metabolized via CYP1A2, 2C, and/or 3A4 isoenzymes. *Risk D: Consider therapy modification*

Cimetidine: May decrease the metabolism of Selective Serotonin Reuptake Inhibitors. *Risk D: Consider therapy modification*

Clozapine: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Clozapine. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP1A2 Inducers (Strong): May increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

CYP1A2 Substrates: CYP1A2 Inhibitors (Strong) may decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

CYP2C19 Substrates: CYP2C19 Inhibitors (Strong) may decrease the metabolism of CYP2C19 Substrates. *Risk D: Consider therapy modification*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Cyproheptadine: May diminish the therapeutic effect of Selective Serotonin Reuptake Inhibitors. *Risk C: Monitor therapy*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Dasatinib: May enhance the anticoagulant effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Desmopressin: Selective Serotonin Reuptake Inhibitors may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Drotrecogin Alfa: Antiplatelet Agents may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

DULoxetine: Fluvoxamine may decrease the metabolism of DULoxetine. *Risk C: Monitor therapy*

Haloperidol: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Haloperidol. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Antiplatelet Agents. Bleeding may occur. *Risk D: Consider therapy modification*

Ibritumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to impaired platelet function and an increased risk of bleeding. *Risk C: Monitor therapy*

Iobenguane I 123: Selective Serotonin Reuptake Inhibitors may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Lithium: Selective Serotonin Reuptake Inhibitors may enhance the adverse/toxic effect of Lithium. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk X: Avoid combination*

Methadone: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Methadone. Fluvoxamine appears to be the only interacting SSRI. *Risk D: Consider therapy modification*

Mexiletine: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Mexiletine. *Risk D: Consider therapy modification*

NSAID (COX-2 Inhibitor): Selective Serotonin Reuptake Inhibitors may enhance the antiplatelet effect of NSAID (COX-2 Inhibitor). *Risk D: Consider therapy modification*

NSAID (Nonselective): Selective Serotonin Reuptake Inhibitors may enhance the antiplatelet effect of NSAID (Nonselective). *Risk D: Consider therapy modification*

OLANZapine: Fluvoxamine may decrease the metabolism of OLANZapine. *Risk D: Consider therapy modification*

Omega-3-Acid Ethyl Esters: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the adverse/toxic effect of Antiplatelet Agents. Specifically, the risk of bleeding may be increased by concurrent use of these agents. *Risk C: Monitor therapy*

Phenytoin: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Phenytoin. *Risk D: Consider therapy modification*

Pimozide: Selective Serotonin Reuptake Inhibitors may enhance the adverse/toxic effect of Pimozide. *Risk X: Avoid combination*

Propranolol: Fluvoxamine may increase the serum concentration of Propranolol. Management: Use a lower initial propranolol dose and be cautious with propranolol dose titration. *Risk D: Consider therapy modification*

Prostacyclin Analogues: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

QuiNIDine: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of QuiNIDine. Fluvoxamine appears to be the only SSRI of concern. *Risk D: Consider therapy modification*

Ramelteon: Fluvoxamine may decrease the metabolism of Ramelteon. *Risk X: Avoid combination*

Ropivacaine: Fluvoxamine may decrease the metabolism of Ropivacaine. *Risk C: Monitor therapy*

Salicylates: Antiplatelet Agents may enhance the adverse/toxic effect of Salicylates. Increased risk of bleeding may result. *Risk C: Monitor therapy*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Tacrine: Fluvoxamine may decrease the metabolism of Tacrine. *Risk D: Consider therapy modification*

Theophylline Derivatives: Fluvoxamine may decrease the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk D: Consider therapy modification*

Thioridazine: Fluvoxamine may increase the serum concentration of Thioridazine. *Risk X: Avoid combination*

Thrombolytic Agents: Antiplatelet Agents may enhance the anticoagulant effect of Thrombolytic Agents. *Risk C: Monitor therapy*

TiZANidine: Fluvoxamine may decrease the metabolism of TiZANidine. *Risk X: Avoid combination*

Tositumomab and Iodine I 131 Tositumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse events may be increased. *Risk C: Monitor therapy*

TraMADol: Selective Serotonin Reuptake Inhibitors may enhance the neuroexcitatory and/or seizure-potentiating effect of TraMADol. TraMADol may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk D: Consider therapy modification*

Tricyclic Antidepressants: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Tryptophan: May enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Selective Serotonin Reuptake Inhibitors may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol. Patients with depression should avoid/limit intake.

Food: The bioavailability of melatonin has been reported to be increased by fluvoxamine.

Herb/Nutraceutical: Avoid valerian, St John's wort, SAMe, kava kava (may increase risk of serotonin syndrome and/or excessive sedation). Avoid alfalfa, anise, bilberry, bladderwrack, bromelain, cat's claw, celery, chamomile, coleus, cordyceps, dong quai, evening primrose, fenugreek, feverfew, garlic, ginger, ginkgo biloba, ginseng (American), ginseng (Panax), ginseng (Siberian), grape seed, green tea, guggul, horse chestnuts, horseradish, licorice, prickly ash, red clover, reishi, SAMe (S-adenosylmethionine), sweet clover, turmeric, white willow (all have additional antiplatelet activity).

Monitoring ParametersMental status for depression, suicidal ideation (especially at the beginning of therapy or when doses are increased or decreased), anxiety, social functioning, mania, panic attacks; akathisia, weight gain or loss, nutritional intake, sleep; liver function assessment prior to beginning drug therapy

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions at beginning of therapy and periodically with long-term use. Taper dosage slowly when discontinuing (allow 3-4 weeks between discontinuing Luvox® and starting another antidepressant). Assess mental status for depression, suicidal ideation, anxiety, social functioning, mania, or panic attack. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsLiver function assessment prior to beginning drug therapy

Patient EducationTake exactly as directed; do not increase dose or frequency. It may take 2-3 weeks to achieve desired results. Avoid alcohol, caffeine, and other prescription or OTC medications unless approved by prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, lightheadedness, impaired coordination, dizziness, weakness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, dry mouth, or anorexia (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); constipation (increased exercise, fluids, fruits, or fiber may help); diarrhea (buttermilk, yogurt, or boiled milk may help); postural hypotension (use caution when climbing stairs or changing position from lying or sitting to standing); or decreased sexual function or libido (reversible). Report persistent CNS effects (nervousness, restlessness, insomnia, anxiety, excitation, suicide ideation, headache, sedation, seizures, mania, abnormal thinking); rash or skin irritation; muscle cramping, tremors, or change in gait; chest pain or palpitations; change in urinary pattern; or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as maleate: 25 mg, 50 mg, 100 mg

Capsule, extended release, as maleate:

Luvox® CR: 100 mg, 150 mg [gluten free]

Generic AvailableYes: Excludes extended release capsule

ManufacturerSolvay Pharmaceuticals

Pricing: U.S. (www.drugstore.com)

Tablets (Fluvoxamine Maleate)

25 mg (30): $53.99

100 mg (50): $103.99

Mechanism of ActionInhibits CNS neuron serotonin uptake; minimal or no effect on reuptake of norepinephrine or dopamine; does not significantly bind to alpha-adrenergic, histamine or cholinergic receptors

Pharmacodynamics/Kinetics

Onset of action: Depression: The onset of action is within a week, however, individual response varies greatly and full response may not be seen until 8-12 weeks after initiation of treatment.

Absorption: Steady-state plasma concentrations have been noted to be 2-3 times higher in children than those in adolescents; female children demonstrated a significantly higher AUC than males

Distribution: V_d: ~25 L/kg

Protein binding: ~80%, primarily to albumin

Metabolism: Extensively hepatic via oxidative demethylation and deamination

Bioavailability: Immediate release: 53%; not significantly affected by food

Half-life elimination: 15-16 hours; 17-26 hours in the elderly

Time to peak, plasma: 3-8 hours

Excretion: Urine (~85% as metabolites; ~2% as unchanged drug)

Dental Health Professional ConsiderationsProblems with SSRI-induced bruxism have been reported and may preclude their use. Clinicians attempting to evaluate any patient with bruxism or involuntary muscle movement, who is simultaneously being treated with an SSRI drug, should be aware of the potential association.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation) and abnormal taste. Problems with SSRI-induced bruxism have been reported and may preclude their use; clinicians attempting to evaluate any patient with bruxism or involuntary muscle movement, who is simultaneously being treated with an SSRI drug, should be aware of the potential association. See Dental Comment.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsAlthough caution should be used in patients taking tricyclic antidepressants, no interactions have been reported with vasoconstrictors and fluvoxamine, a nontricyclic antidepressant which acts to increase serotonin; no precautions appear to be needed

Mental Health: Child/Adolescent ConsiderationsChildren 8-17 years of age with obsessive-compulsive disorder (OCD) received 50-200 mg/day for 10 weeks (Riddle, 2001). One hundred twenty-eight children 6-17 years of age with social phobia, separation anxiety disorder, or generalized anxiety disorder, who had received psychological treatment for 3 weeks without improvement, received fluvoxamine up to 300 mg/day for 8 weeks (Research Unit, 2001).

“Fluvoxamine for the Treatment of Anxiety Disorders in Children and Adolescents. The Research Unit on Pediatric Psychopharmacology Anxiety Study Group,” *N Engl J Med*, 2001, 344(17):1279-85.

Mental Health CommentThe SSRIs as a class are generally considered to be safe and equally effective. Allow sufficient dose-response time (6-12 weeks). Differences lie in approved indications, receptor profiles, pharmacokinetics, and cytochrome P450 activity profile. Subtle differences exist in adverse effect profiles. All SSRIs have the potential to cause sexual dysfunction. Fluvoxamine is only approved in U.S. for obsessive-compulsive disorder (OCD), offers no advantage over other SSRIs, and is associated with significant CYP inhibitory properties.

Folic Acid, Cyanocobalamin, and Pyridoxine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(FOE lik AS id, sye an oh koe BAL a min, & peer i DOKS een)

U.S. Brand NamesAllanFol RX [DSC]; ComBgen™; Folamin™; Folbee; Folgard® RX; Folgard® [OTC]; Foltx®; Tricardio B

Pharmacologic CategoryVitamin

Use: Labeled IndicationsNutritional supplement in end-stage renal failure, dialysis, hyperhomocysteinemia, homocystinuria, malabsorption syndromes, dietary deficiencies

Dosing: AdultsDietary supplement: Oral: One tablet daily

Dosing: ElderlyRefer to adult dosing.

StorageStore at controlled room temperature of 15°C to 30°C (59°F to 96°F).

ContraindicationsHypersensitivity to folic acid, cyanocobalamin, pyridoxine, or any component of the formulation

Warnings/PrecautionsSee individual agents.

Adverse ReactionsSee individual agents.

Drug Interactions

Altretamine: Pyridoxine may diminish the therapeutic effect of Altretamine. Specifically when altretamine is used in combination with Cisplatin the response duration may be diminished. *Risk D: Consider therapy modification*

Barbiturates: Pyridoxine may increase the metabolism of Barbiturates. Apparent in high pyridoxine doses (eg, 200 mg/day) *Risk C: Monitor therapy*

Chloramphenicol: May diminish the therapeutic effect of Cyanocobalamin. The expected hematologic response for the treatment of anemia may be opposed. *Risk D: Consider therapy modification*

Levodopa: Pyridoxine may diminish the therapeutic effect of Levodopa. *Risk D: Consider therapy modification*

PHENobarbital: Folic Acid may decrease the serum concentration of PHENobarbital. *Risk C: Monitor therapy*

Phenytoin: Folic Acid may decrease the serum concentration of Phenytoin. *Risk C: Monitor therapy*

Phenytoin: Pyridoxine may increase the metabolism of Phenytoin. This is most apparent in high pyridoxine doses (eg, 80 mg to 200 mg daily) *Risk C: Monitor therapy*

Primidone: Folic Acid may decrease the serum concentration of Primidone. Additionally, folic acid may decrease concentrations of active metabolites of primidone (e.g., phenobarbital). *Risk C: Monitor therapy*

Raltitrexed: Folic Acid may diminish the therapeutic effect of Raltitrexed. *Risk X: Avoid combination*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Tablet: Folic acid 0.8 mg, cyanocobalamin 1000 mcg, and pyridoxine hydrochloride 50 mg

AllanFol RX: Folic acid 2.2 mg, cyanocobalamin 1000 mcg, and pyridoxine hydrochloride 25 mg [DSC]

ComBgen™: Folic acid 2.2 mg, cyanocobalamin 500 mcg, and pyridoxine hydrochloride 25 mg

Folamin™: Folic acid 2.5 mg, cyanocobalamin 2000 mcg, and pyridoxine hydrochloride 25 mg

Folbee: Folic acid 2.5 mg, cyanocobalamin 1000 mcg, and pyridoxine hydrochloride 25 mg [dye free, lactose free, and sugar free]

Folgard®: Folic acid 0.8 mg, cyanocobalamin 115 mcg, and pyridoxine hydrochloride 10 mg

Folgard® RX: Folic acid 2.2 mg, cyanocobalamin 1000 mcg, and pyridoxine hydrochloride 25 mg

Foltx®: Folic acid 2.5 mg, cyanocobalamin 2000 mcg, and pyridoxine hydrochloride 25 mg

Tricardio B: Folic acid 0.4 mg, cyanocobalamin 250 mcg, and pyridoxine hydrochloride 25 mg

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status None reported

Mental Health: Effects on Psychiatric Treatment None reported

Cardiovascular Considerations Epidemiological evidence suggests that total plasma homocysteine level may be an independent cardiovascular risk factor. Plasma homocysteine levels are strongly influenced by genetics and diet (folic acid, pyridoxine/vitamin B_6, and cyanocobalamine/vitamin B_{12}). These vitamins help to break down homocysteine in the body.

Schnyder, et al, studied the effects of homocysteine-lowering therapy (folic acid 1 mg/day, vitamin B_6 10 mg/day, vitamin B_{12} 0.4 mg/day) in patients with coronary artery disease after successful angioplasty in the Swiss Heart Study. This randomized, double-blind, placebo-controlled trial looked at a composite endpoint (death, nonfatal MI, repeat revascularization) 6 months and 1 year after angioplasty. Homocysteine-lowering therapy significantly decreased the incidence of major adverse events, primarily due to a reduced rate of target lesion revascularization. Investigators in the Folate After Coronary Intervention Trial randomized patients who underwent successful coronary stenting procedures to placebo or folic acid (1.2 mg/day), vitamin B_6 (4.8 mg/day), and vitamin B_{12} (0.06 mg/day). Vitamin supplementation was associated with increased restenosis in these PCI patients.

Liem and colleagues randomized 593 patients with stable coronary artery disease to either folic acid supplementation (0.5 mg/day) or none in an open-label study. All patients were being treated with an HMG-CoA reductase inhibitor. The primary endpoint was a composite of vascular events and all cause mortality. Patients were followed up for 2 years. Patients treated with folic acid had a significant reduction in plasma homocysteine levels but the primary endpoint was encountered by a similar number of patients in both groups. The authors concluded that folic acid does not seem to reduce clinical endpoints in patients with stable coronary artery disease. Further investigation is required to sort out the discrepancies in these trials.

Index Terms Cyanocobalamin, Folic Acid, and Pyridoxine; Folacin, Vitamin B_{12}, and Vitamin B_6; Pyridoxine, Folic Acid, and Cyanocobalamin

Folic Acid

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Folic acid may be confused with folinic acid

Pronunciation(FOE lik AS id)
U.S. Brand NamesFolacin-800 [OTC]
Canadian Brand NamesApo-Folic®
Pharmacologic CategoryVitamin, Water Soluble
Use: Labeled IndicationsTreatment of megaloblastic and macrocytic anemias due to folate deficiency; dietary supplement to prevent neural tube defects
Use: Unlabeled/InvestigationalAdjunctive cofactor therapy in methanol toxicity (alternative to leucovorin)
Dosing: Adults

Anemia: Oral, I.M., I.V., SubQ: 0.4 mg/day

Pregnant and lactating women: 0.8 mg/day

RDA: Expressed as dietary folate equivalents: 400 mcg/day

Prevention of neural tube defects: Oral:

Females of childbearing potential: 400 mcg/day

Females at high risk or with family history of neural tube defects: 4 mg/day

Dosing: ElderlyRefer to adult dosing. Vitamin B_{12} deficiency must be ruled out before initiating folate therapy due to frequency of combined nutritional deficiencies: RDA requirements (1999): 400 mcg/day (0.4 mg) minimum.
Dosing: Pediatric

Anemia: Oral, I.M., I.V., SubQ:

Infants: 0.1 mg/day

Children <4 years: Up to 0.3 mg/day

Children >4 years and Adults: Refer to adult dosing.

RDA: Expressed as dietary folate equivalents: Oral: Children:

1-3 years: 150 mcg/day

4-8 years: 200 mcg/day

9-13 years: 300 mcg/day

≥14 years: Refer to adult dosing.

Administration: I.M.May also be administered by deep I.M. injection.
Administration: I.V. DetailpH: 8-11
Dietary ConsiderationsAs of January 1998, the FDA has required manufacturers of enriched flour, bread, corn meal, pasta, rice, and other grain products to add folic acid to their products. The intent is to help decrease the risk of neural tube defects by increasing folic acid intake. Other foods which contain folic acid include dark green leafy vegetables, citrus fruits and juices, and lentils.
CompatibilityStable in D_5W, $D_{20}W$, NS, fat emulsion 10%; **incompatible** with $D_{40}W$, $D_{50}W$. Do not use with oxidizing and reducing agents or heavy metal ions.

Y-site administration: Compatible: Famotidine.

Compatibility in syringe: Incompatible: Doxapram.

Compatibility when admixed: Incompatible: Calcium gluconate.

Extemporaneously PreparedA 1 mg/mL folic acid solution may be prepared by crushing fifty 1 mg tablets. Dissolve in a small amount of distilled water, then add sufficient distilled water to make a final volume of 50 mL. Adjust the pH to 8 with sodium hydroxide. It is stable for 42 days at room temperature.

Nahata MC and Hipple TF, *Pediatric Drug Formulations*, Harvey Whitney Books Company, 1992.

ContraindicationsHypersensitivity to folic acid or any component of the formulation

Warnings/Precautions

Disease-related concerns:

- Anemia: Monotherapy: Not appropriate for monotherapy with pernicious, aplastic, or normocytic anemias when anemia is present with vitamin B_{12} deficiency.

- Pernicious anemia: Doses >0.1 mg/day may obscure pernicious anemia with continuing irreversible nerve damage progression.

Dosage form specific issues:

- Benzyl alcohol: Injection contains benzyl alcohol (1.5%) as preservative which has been associated with "gasping syndrome" in neonates.

Other warnings/precautions:

- Resistance to treatment: May occur with depressed hematopoiesis, alcoholism, and deficiencies of other vitamins.

Geriatric ConsiderationsElderly frequently have combined nutritional deficiencies. Must rule out vitamin B_{12} deficiency before initiating folate therapy. Elderly, due to decreased nutrient intake, may benefit from daily intake of a multiple vitamin with minerals.

Pregnancy Risk FactorA

Pregnancy ConsiderationsFolic acid requirements are increased during pregnancy; a deficiency may result in fetal harm.

LactationEnters breast milk/compatible

Adverse ReactionsFrequency not defined.

Allergic reaction, bronchospasm, flushing (slight), malaise (general), pruritus, rash

Drug Interactions

PHENobarbital: Folic Acid may decrease the serum concentration of PHENobarbital. *Risk C: Monitor therapy*

Phenytoin: Folic Acid may decrease the serum concentration of Phenytoin. *Risk C: Monitor therapy*

Primidone: Folic Acid may decrease the serum concentration of Primidone. Additionally, folic acid may decrease concentrations of active metabolites of primidone (e.g., phenobarbital). *Risk C: Monitor therapy*

Raltitrexed: Folic Acid may diminish the therapeutic effect of Raltitrexed. *Risk X: Avoid combination*

Test InteractionsFalsely low serum concentrations may occur with the *Lactobacillus casei* assay method in patients on anti-infectives (eg, tetracycline)

Reference RangeTherapeutic: 0.005-0.015 mcg/mL

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess therapeutic effectiveness and adverse response on a regular basis throughout therapy. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take exactly as prescribed. Toxicity can occur from elevated doses. Increased intake of foods high in folic acid (eg, dried beans, nuts, bran, vegetables, fruits) may be recommended by prescriber. Excessive use of alcohol increases requirement for folic acid. May turn urine more intensely yellow. Report skin rash. **Pregnancy precaution:** Inform prescriber if you are pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as sodium folate: 5 mg/mL (10 mL) [contains benzyl alcohol, edetate disodium]

Tablet: 0.4 mg, 0.8 mg, 1 mg

Folacin-800: 0.8 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Folic Acid)

1 mg (100): $14.99

400 mcg (250): $12.99

Mechanism of ActionFolic acid is necessary for formation of a number of coenzymes in many metabolic systems, particularly for purine and pyrimidine synthesis; required for nucleoprotein synthesis and maintenance in erythropoiesis; stimulates WBC and platelet production in folate deficiency anemia. Folic acid enhances the elimination of formic acid, the toxic metabolite of methanol (unlabeled use).

Pharmacodynamics/Kinetics

Onset of action: Peak effect: Oral: 0.5-1 hour

Absorption: Proximal part of small intestine

Pharmacotherapy PearlsThe RDA for folic acid is presented as dietary folate equivalents (DFE). DFE adjusts for the difference in bioavailability of folic acid from food as compared to dietary supplements.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental Status May cause drowsiness

Mental Health: Effects on Psychiatric Treatment None reported

Cardiovascular Considerations Epidemiological evidence suggests that total plasma homocysteine level may be an independent cardiovascular risk factor. Plasma homocysteine levels are strongly influenced by genetics and diet (folic acid, pyridoxine/vitamin B_6, and cyanocobalamine/vitamin B_{12}). These vitamins help to break down homocysteine in the body.

Schnyder, et al, studied the effects of homocysteine-lowering therapy (folic acid 1 mg/day, vitamin B_6 10 mg/day, vitamin B_{12} 0.4 mg/day) in patients with coronary artery disease after successful angioplasty in the Swiss Heart Study. Follitropin Alfa

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(foe li TRO pin AL fa)

U.S. Brand NamesGonal-f® ; Gonal-f® RFF

Canadian Brand NamesGonal-f® ; Gonal-f® Pen

Pharmacologic CategoryGonadotropin; Ovulation Stimulator

Use: Labeled Indications

Gonal-f®: Ovulation induction in patients in whom the cause of infertility is functional and not caused by primary ovarian failure; development of multiple follicles with Assisted Reproductive Technology (ART); spermatogenesis induction

Gonal-f® RFF: Ovulation induction in patients in whom the cause of infertility is functional and not caused by primary ovarian failure; development of multiple follicles with ART

Dosing: Adults **Note:** Dose should be individualized. Use the lowest dose consistent with the expectation of good results. Over the course of treatment, doses may vary depending on individual patient response.

Ovulation induction: *Gonal-f®, Gonal-f® RFF:* Females: SubQ: Initial: 75 int. units/day; incremental dose adjustments of up to 37.5 int. units may be considered after 14 days; further dose increases of the same magnitude can be made, if necessary, every 7 days (maximum dose: 300 int. units/day). If response to follitropin is appropriate, hCG is given 1 day following the last dose. Withhold hCG if serum estradiol is >2000 pg/mL, if the ovaries are abnormally enlarged, or if abdominal pain occurs. In general, therapy should not exceed 35 days.

ART: *Gonal-f®, Gonal-f® RFF:* Females: SubQ: Initiate therapy with follitropin alfa in the early follicular phase (cycle day 2 or day 3) at a dose of 150 int. units/day, until sufficient follicular development is attained. In most cases, therapy should not exceed 10 days. In patients ≥35 years whose endogenous gonadotropin levels are suppressed, initiate follitropin alfa at a dose of 225 int. units/day. Continue treatment until adequate follicular development is indicated as determined by ultrasound in combination with measurement of serum estradiol levels. Consider adjustments to dose after 5 days based on the patient's response; adjust subsequent dosage every 3-5 days by ≤75-150 int. units additionally at each adjustment. Doses >450 int. units/day are not recommended. Once adequate follicular development is evident, administer hCG to induce final follicular maturation in preparation for oocyte. Withhold hCG if the ovaries are abnormally enlarged.

Spermatogenesis induction: *Gonal-f®:* Males: SubQ: Therapy should begin with hCG pretreatment until serum testosterone is in normal range, then 150 int. units 3 times/week with hCG 3 times/week; continue with lowest dose needed to induce spermatogenesis (maximum dose: 300 int. units 3 times/week); may be given for up to 18 months

Dosing: ElderlyRefer to adult dosing. Clinical studies did not include patients >65 years.

Administration: OtherGonal-f®, Gonal-f® RFF: Administer SubQ. Contents of multidose vials should be administered using the calibrated syringes provided by the manufacturer. Do not shake solution; allow any bubbles to settle prior to administration.

Storage

Gonal-f®: Store powder refrigerated or at room temperature of 2°C to 25°C (36°F to 77°F). Protect from light. Following reconstitution, multidose vials may be stored under refrigeration or at room temperature for up to 28 days. Protect from light.

Gonal-f® RFF:

Powder: Store at room temperature or under refrigeration of 2°C to 25°C (36°F to 77°F). Protect from light.

Solution: Prior to dispensing, store under refrigeration at 2°C to 8°C (36°F to 46°F). Upon dispensing, patient may store under refrigeration until product expiration date or at room temperature of 20°C to 25°C (68°F to 77°F) for up to 3 months. Do not freeze. Protect from light. After first use, discard unused portion after 28 days.

Reconstitution

Gonal-f®: Dissolve the contents of vial by slowly injecting provided diluent; do not shake. If bubbles appear, allow to settle prior to use. Final concentration: 600 int. units/mL.

Gonal-f® RFF: Powder: Dissolve contents of one or more vials using diluent provided in prefilled syringe. (Total concentration should not exceed 450 int. units/mL.) Slowly inject diluent into vial, and gently rotate vial until powder is dissolved; do not shake vial. If bubbles appear, allow to settle prior to use. Use immediately after reconstitution.

ContraindicationsHypersensitivity to follitropins or any component of the formulation; high levels of FSH indicating primary gonadal failure (ovarian or testicular); uncontrolled thyroid or adrenal dysfunction; tumor of the ovary, breast, uterus, hypothalamus, testis, or pituitary gland; abnormal vaginal bleeding of undetermined origin; ovarian cysts or enlargement not due to polycystic ovary syndrome; pregnancy

Warnings/Precautions

Concerns related to adverse effects:

- Ovarian enlargement: May be accompanied by abdominal distention or abdominal pain, occurs in ~20% of those treated with urofollitropin and hCG, and generally regresses without treatment within 2-3 weeks. If ovaries are abnormally enlarged on the last day of treatment, withhold hCG to reduce the risk of ovarian hyperstimulation syndrome (OHSS).

- Ovarian hyperstimulation syndrome (OHSS): Reported in about 7% of patients; it is characterized by severe ovarian enlargement, abdominal pain/distention, nausea, vomiting, diarrhea, dyspnea, and oliguria, and may be accompanied by ascites, pleural effusion, hypovolemia, electrolyte imbalance, hemoperitoneum, and thromboembolic events. If hyperstimulation occurs, stop treatment and hospitalize patient. This syndrome develops rapidly within 24 hours to several days and generally occurs during the 7-10 days immediately following treatment. Hemoconcentration associated with fluid loss into the abdominal cavity has occurred and should be assessed by fluid intake and output, weight, hematocrit, serum and urinary electrolytes, urine specific gravity, BUN and creatinine, and abdominal girth. Determinations should be performed daily or more often if the need arises. Treatment is primarily symptomatic and consists of bedrest, fluid and electrolyte replacement, and analgesics. The ascitic, pleural, and pericardial fluids should not be removed unless needed to relieve symptoms of cardiopulmonary distress.

- Pulmonary effects: Serious pulmonary conditions (atelectasis, acute respiratory distress syndrome, and exacerbation of asthma) have been reported.

- Thromboembolic events: In association with and separate from ovarian hyperstimulation syndrome (OHSS), thromboembolic events have been reported.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: To minimize risks, use only at the lowest effective dose. Monitor ovarian response with serum estradiol and vaginal ultrasound on a regular basis.

- Experienced physician: These medications should only be used by physicians who are thoroughly familiar with infertility problems and their management.

- Multiple births: May result from the use of these medications; advise patient of the potential risk of multiple births before starting the treatment.

Pregnancy Risk FactorX

Pregnancy ConsiderationsEctopic pregnancy, congenital abnormalities, spontaneous abortion, and multiple births have been reported. The incidence of congenital abnormality may be slightly higher after ART than with spontaneous conception; higher incidence may be related to parenteral characteristics (maternal age, sperm characteristics).

LactationExcretion in breast milk unknown/not recommended

Adverse ReactionsPercentage may vary by indication, product formulation

>10%:

Central nervous system: Headache

Endocrine & metabolic: Ovarian cyst

Gastrointestinal: Abdomen enlarged, abdominal pain, nausea

Miscellaneous: Upper respiratory infection

1% to 10%:

Central nervous system: Dizziness, emotional lability, fever, malaise, migraine, pain

Dermatologic: Acne

Endocrine & metabolic: Breast pain, cervix lesion, hot flashes, intermenstrual bleeding, menstrual disorder, ovarian disorder, ovarian hyperstimulation

Gastrointestinal: Constipation, diarrhea, dyspepsia, flatulence, pelvic pain, stomatitis (ulcerative), toothache, vomiting, weight gain

Genitourinary: Cystitis, leukorrhea, micturition frequency, urinary tract infection, uterine hemorrhage, vaginal hemorrhage

Local: Injection site bruising, edema, inflammation, pain, reaction

Neuromuscular & skeletal: Back pain

Respiratory: Cough, flu-like symptoms, pharyngitis, rhinitis, sinusitis

Miscellaneous: Infection, moniliasis

Postmarketing, case reports, or events reported with gonadotropins: Adnexal torsion, anaphylactoid reactions, hemoperitoneum, hypersensitivity reactions, ovarian enlargement, pulmonary complications, vascular complications

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersMonitor sufficient follicular maturation. This may be directly estimated by sonographic visualization of the ovaries and endometrial lining or measuring serum estradiol levels. The combination of both ultrasonography and measurement of estradiol levels is useful for monitoring for the growth and development of follicles and timing hCG administration.

The clinical evaluation of estrogenic activity (changes in vaginal cytology and changes in appearance and volume of cervical mucus) provides an indirect estimate of the estrogenic effect upon the target organs and, therefore, it should only be used adjunctively with more direct estimates of follicular development (ultrasonography and serum estradiol determinations).

The clinical confirmation of ovulation is obtained by direct and indirect indices of progesterone production. The indices most generally used are: rise in basal body temperature, increase in serum progesterone, and menstruation following the shift in basal body temperature.

Monitor for signs and symptoms of OHSS for at least 2 weeks following hCG administration.

Spermatogenesis: Monitor serum testosterone levels, sperm count

Nursing: Physical Assessment/MonitoringThis medication should only be prescribed by a fertility specialist. Assess results of laboratory tests and therapeutic effectiveness on a regular basis. Assess knowledge/teach patient appropriate use (injection technique and syringe disposal), interventions to reduce side effects, and adverse symptoms to report. **Pregnancy risk factor X:** Pregnancy must be excluded before starting medication.

Monitoring: Lab TestsMonitor sufficient follicular maturation. This may be directly estimated by sonographic visualization of the ovaries and endometrial lining or measuring serum estradiol levels. The combination of both ultrasonography and measurement of estradiol levels is useful for monitoring for the growth and development of follicles and timing hCG administration.

Spermatogenesis: Monitor serum testosterone levels, sperm count.

Patient EducationThis medication can only be administered by injection. If you are using this medication at home, follow exact instructions for administering injections and disposal of syringes. Administer exact amount as instructed; do not alter dosage or miss a dose. If dose is missed, notify prescriber. Frequent laboratory tests will be required while you are on this therapy; do not miss appointments for laboratory tests or ultrasound. You may experience headache, dizziness, or fever (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or nausea or vomiting (small frequent meals, frequent oral care, sucking lozenges, or chewing gum may help). Report immediately abdominal pain/distension, bloating, persistent nausea, vomiting, diarrhea; dyspnea, respiratory difficulty, exacerbation of asthma; swelling, pain, or redness of extremities; itching or burning on urination; menstrual irregularity, acute backache; rash, pain, or inflammation at injection site; or other adverse response. **Pregnancy/breast-feeding precautions:** Pregnancy must be ruled out prior to initiating this medication. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution [rDNA origin]:

Gonal-f®: 450 int. units [contains sucrose 30 mg; packaged with diluent and calibrated syringes; diluent contains benzyl alcohol]

Gonal-f® RFF: 75 int. units [contains sucrose 30 mg; packaged with diluent in prefilled syringe]

Injection, solution [rDNA origin]:

Gonal-f® RFF: 300 int. units/0.5 mL (0.5 mL) [contains sucrose 60 mg/mL]; 450 int. units/0.75 mL (0.75 mL) [contains sucrose 60 mg/mL]; 900 int. units/1.5 mL (1.5 mL) [contains sucrose 60 mg/mL]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Solution (reconstituted) (Gonal-f)

450 unit (1): $592.68

Solution (reconstituted) (Gonal-f RFF)

75 unit (1): $99.99

Mechanism of ActionFollitropin alfa is a human FSH preparation of recombinant DNA origin. Follitropins stimulate ovarian follicular growth in women who do not have primary ovarian failure, and stimulate spermatogenesis in men with hypogonadotrophic hypogonadism. FSH is required for normal follicular growth, maturation, gonadal steroid production, and spermatogenesis.

Pharmacodynamics/Kinetics

Onset of action: Peak effect:

Spermatogenesis, median: 6.8-12.4 months (range 2.7-15.7 months)

Follicle development: Within cycle

Absorption: I.M., SubQ: Absorption rate is slower than the elimination rate

Distribution: Mean V_d: 10 L with *in vitro* fertilization/embryo transfer patients

Bioavailability: ~66% to 76% in healthy female volunteers

Half-life elimination:

I.M.: 50 hours in healthy female volunteers

SubQ: 24 hours in healthy female volunteers; 32 hours with *in vitro* fertilization/embryo transfer patients; 32-41 hours in healthy male volunteers

Time to peak: In healthy volunteers:

Females: SubQ: 8-16 hours; I.M.: 25 hours

Males: SubQ: 11-20 hours

Excretion: Clearance: I.V.: 0.6 L/hour in healthy female volunteers

Pharmacotherapy PearlsThe currently available recombinant follitropin products are structurally identical to native follicle-stimulating hormone. The “alpha” and “beta” nomenclature refers to their differences in purification and order of marketing. Follitropin alpha was marketed first, followed by follitropin beta. RFF for the Gonal-f® product signifies “revised formula female.”

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Stomatitis and toothache.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsFollicle Stimulating Hormone, Recombinant; FSH; rFSH-alpha; rhFSH-alpha

U.S. Brand NamesFollistim® AQ; Follistim® AQ Cartridge

Canadian Brand NamesPuregon®

Pharmacologic CategoryGonadotropin; Ovulation Stimulator

Use: Labeled IndicationsOvulation induction in patients in whom the cause of infertility is functional and not caused by primary ovarian failure; development of multiple follicles with Assisted Reproductive Technology (ART)

Dosing: Adults**Note:** Dose should be individualized. Use the lowest dose consistent with the expectation of good results. Over the course of treatment, doses may vary depending on individual patient response.

Ovulation induction: Females:

Follistim® AQ: I.M., SubQ: Stepwise approach: Initiate therapy with 75 int. units/day for up to 14 days. Increase by 37.5 int. units at weekly intervals until follicular growth or serum estradiol levels indicate an adequate response. The maximum (individualized) daily dose that has been safely used for ovulation induction in patients during clinical trials is 300 int. units. If response to follitropin is appropriate, hCG is given 1 day following the last dose. Withhold hCG if the ovaries are abnormally enlarged, or if abdominal pain occurs.

Follistim® AQ Cartridge: SubQ: Stepwise approach: Initiate therapy with 75 int. units/day for up to 7 days. Increase by 25 or 50 int. units at weekly intervals until follicular growth or serum estradiol levels indicate an adequate response. The maximum (individualized) daily dose that has been safely used for ovulation induction in patients during clinical trials is 175 int. units. If response to follitropin is appropriate, hCG is given 1 day following the last dose. Withhold hCG if the ovaries are abnormally enlarged, or if abdominal pain occurs. See **"Note"** for dosage adjustment for this product.

ART: Females:

Follistim® AQ: I.M., SubQ: A starting dose of 150-225 int. units is recommended for at least the first 4 days of treatment. The dose may be adjusted for the individual patient based upon their ovarian response. The usual maintenance dose was 75-300 int. units for 6-12 days; 375-600 int. units in patients who were poor responders. The maximum daily dose used in clinical studies is 600 int. units. When a sufficient number of follicles of adequate size are present, the final maturation of the follicles is induced by administering hCG. Oocyte retrieval is performed 34-36 hours later. Withhold hCG in cases where the ovaries are abnormally enlarged on the last day of follitropin beta therapy.

Follistim® AQ Cartridge: SubQ: A starting dose of 150-225 int. units is recommended for at least the first 5 days of treatment. The dose may be adjusted for the individual patient based upon their ovarian response. The maximum daily dose used in clinical studies is 450 int. units. When a sufficient number of follicles of adequate size are present, the final maturation of the follicles is induced by administering hCG. Oocyte retrieval is performed 34-36 hours later. Withhold hCG in cases where the ovaries are abnormally enlarged on the last day of follitropin beta therapy. See **"Note"** for dosage adjustment for this product.

Note: Dose adjustment for Follistim® AQ Cartridge: When administered using the Follistim Pen®, the Follistim® AQ Cartridge delivers 18% more follitropin beta when compared to dissolved lyophilized follitropin beta administered by a conventional syringe. If the above starting doses were previously used when administering a recombinant lyophilized gonadotropin product via a conventional syringe, lower starting and maintenance doses should be considered when switching to Follistim® AQ Cartridge. The following dose conversion may be used:

Follistim® AQ Dosing Conversion

Dose Administered Using Powder for Solution/Conventional Syringe	Follistim® AQ Dose Administered Using Follistim Pen®
75 int. units	50 int. units
150 int. units	125 int. units
225 int. units	175 int. units
300 int. units	250 int. units
375 int. units	300 int. units
450 int. units	375 int. units

Administration: I.M.Follistim® AQ may be administered by I.M. or SubQ injection.
Administration: Other

Follistim® AQ may be administered by I.M. or SubQ injection. Follistim® AQ cartridge may be administered only by SubQ injection using the Follistim Pen® which can be set to deliver the appropriate dose.

StoragePrior to dispensing, store refrigerated at 2°C to 8°C (36°F to 46°F). After dispensed, may be stored under refrigeration or ≤25°C (77°F) for up to 3 months. Once cartridge is pierced, must be stored in refrigerator and used within 28 days. Do not freeze. Protect from light.
ContraindicationsHypersensitivity to follitropins or any component of the formulation; high levels of FSH indicating primary ovarian failure; uncontrolled thyroid or adrenal dysfunction; tumor of the ovary, breast, uterus, hypothalamus, or pituitary gland; abnormal vaginal bleeding of undetermined origin; ovarian cysts or enlargement not due to polycystic ovary syndrome; pregnancy
Warnings/Precautions

Concerns related to adverse effects:

- Ovarian enlargement: May be accompanied by abdominal distention or abdominal pain, occurs in ~20% of those treated with urofollitropin and hCG, and generally regresses without treatment within 2-3 weeks. If ovaries are abnormally enlarged on the last day of treatment, withhold hCG to reduce the risk of ovarian hyperstimulation syndrome (OHSS).

- Ovarian hyperstimulation syndrome (OHSS): OHSS is characterized by severe ovarian enlargement, abdominal pain/distention, nausea, vomiting, diarrhea, dyspnea, and oliguria, and may be accompanied by ascites, pleural effusion, hypovolemia, electrolyte imbalance, hemoperitoneum, and thromboembolic events. If hyperstimulation occurs, stop treatment and hospitalize patient. This syndrome develops rapidly within 24 hours to several days and generally occurs during the 7-10 days immediately following treatment. Hemoconcentration associated with fluid loss into the abdominal cavity has occurred and should be assessed by fluid intake and output, weight, hematocrit, serum and urinary electrolytes, urine specific gravity, BUN and creatinine, and abdominal girth. Determinations should be performed daily or more often if the need arises. Treatment is primarily symptomatic and consists of bedrest, fluid and electrolyte replacement, and analgesics. The ascitic, pleural, and pericardial fluids should not be removed unless needed to relieve symptoms of cardiopulmonary distress.

- Pulmonary effects: Serious pulmonary conditions (atelectasis, acute respiratory distress syndrome, and exacerbation of asthma) have been reported.

- Thromboembolic events: In association with and separate from ovarian hyperstimulation syndrome, thromboembolic events have been reported.

Special populations:

- Elderly: Safety and efficacy have not been established in the elderly.

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Neomycin: May contain trace amounts of neomycin.

- Streptomycin: May contain trace amounts of streptomycin.

Other warnings/precautions:

- Appropriate use: To minimize risks, use only at the lowest effective dose. Monitor ovarian response with serum estradiol and vaginal ultrasound on a regular basis.

- Experienced physician: These medications should only be used by physicians who are thoroughly familiar with infertility problems and their management.

- Multiple births: May result from the use of these medications; advise patient of the potential risk of multiple births before starting the treatment.

Pregnancy Risk FactorX
Pregnancy ConsiderationsEctopic pregnancy, congenital abnormalities, and multiple births have been reported. The incidence of congenital abnormality may be slightly higher after ART than with spontaneous conception; higher incidence may be related to parenteral characteristics (maternal age, sperm characteristics).
LactationExcretion in breast milk unknown/not recommended
Adverse ReactionsPercentage may vary by indication, product formulation

>10%:

Endocrine & metabolic: Breast pain

Gastrointestinal: Abdominal pain, flatulence, nausea

Miscellaneous: Miscarriage

1% to 10%:

Central nervous system: Headache

Endocrine & metabolic: Ovarian hyperstimulation syndrome, ovarian pain

Gastrointestinal: Abdomen enlarged, constipation

Local: Injection site reaction

Neuromuscular & skeletal: Back pain

Respiratory: Sinusitis, upper respiratory tract infection

Postmarketing, case reports, or events reported with gonadotropins: Acute respiratory distress syndrome, adnexal torsion, arterial occlusions, atelectasis, breast tenderness, chills, dizziness, dry skin, dyspnea, erythema, febrile reaction, fever, flu-like syndrome, hair loss, cerebral vascular occlusion, hemoperitoneum, hives, joint pain, malaise, musculoskeletal ache, ovarian neoplasm, pulmonary embolism, rash, tachycardia, tachypnea

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersMonitor sufficient follicular maturation. This may be directly estimated by sonographic visualization of the ovaries and endometrial lining or measuring serum estradiol levels. The combination of both ultrasonography and measurement of estradiol levels is useful for monitoring for the growth and development of follicles and timing hCG administration.

The clinical evaluation of estrogenic activity (changes in vaginal cytology and changes in appearance and volume of cervical mucus) provides an indirect estimate of the estrogenic effect upon the target organs and, therefore, it should only be used adjunctively with more direct estimates of follicular development (ultrasonography and serum estradiol determinations).

The clinical confirmation of ovulation is obtained by direct and indirect indices of progesterone production. The indices most generally used are: rise in basal body temperature, increase in serum progesterone, and menstruation following the shift in basal body temperature.

Monitor for signs and symptoms of OHSS for at least 2 weeks following hCG administration.

Nursing: Physical Assessment/MonitoringThis medication should only be prescribed by a fertility specialist. Assess results of laboratory tests and therapeutic effectiveness on a regular basis. Assess knowledge/teach patient appropriate use (injection technique and syringe disposal), interventions to reduce side effects, and adverse symptoms to report. **Pregnancy risk factor X:** Pregnancy must be excluded before starting medication.

Monitoring: Lab TestsMonitor sufficient follicular maturation. This may be directly estimated by sonographic visualization of the ovaries and endometrial lining or measuring serum estradiol levels. Pronunciation(foe ME pi zole)

U.S. Brand NamesAntizol®

Pharmacologic CategoryAntidote

Use: Labeled IndicationsTreatment of methanol or ethylene glycol poisoning alone or in combination with hemodialysis

Use: Unlabeled/InvestigationalTreatment of propylene glycol toxicity

Dosing: Adults**Note:** Fomepizole therapy should begin immediately upon suspicion of ethylene glycol or methanol ingestion.

Ethylene glycol and methanol toxicity: I.V.: Loading dose of 15 mg/kg should be administered, followed by doses of 10 mg/kg every 12 hours for 4 doses, then 15 mg/kg every 12 hours thereafter until ethylene glycol levels have been reduced <20 mg/dL and patient is asymptomatic with normal pH.

Dosing: ElderlySpecific studies have not been conducted in elderly patients.

Dosing: PediatricSafety and efficacy have not been established in pediatric patients.

Dosing: Renal ImpairmentThe manufacturer provides the following dosage recommendations:

Dose at the beginning of hemodialysis:

If <6 hours since last fomepizole dose: Do not administer dose

If ≥6 hours since last fomepizole dose: Administer next scheduled dose

Dosing during hemodialysis: Dose every 4 hours

Dosing at the time hemodialysis is complete, based on time between last dose and the end of hemodialysis:

<1 hour: Do not administer dose at the end of hemodialysis

1-3 hours: Administer $^{1}/_{2}$ of next scheduled dose

>3 hours: Administer next scheduled dose

Maintenance dose when off hemodialysis: Give next scheduled dose 12 hours from last dose administered.

Alternatively, a loading dose of 10-20 mg/kg followed by 1-1.5 mg/kg/hour continuous infusion during hemodialysis has been described in case reports (Jobard, 1996).

Dosing: Hepatic ImpairmentFomepizole is metabolized in the liver. Specific dosage adjustments have not been determined in patients with hepatic impairment.

Administration: I.V.All doses should be administered as a slow intravenous infusion (IVPB) over 30 minutes

Administration: I.V. DetailAll doses should be administered as a slow intravenous infusion (IVPB) over 30 minutes

StorageStore at controlled room temperature, 20°C to 25°C (68°F to 77°F); fomepizole solidifies at temperatures <25°C (77°F). If solution becomes solid in the vial, it be should be carefully warmed by running the vial under warm water or by holding in the hand. Solidification does not affect the efficacy, safety, or stability of the drug.

ReconstitutionPrior to administration, dilute in at least 100 mL 0.9% sodium chloride or dextrose 5% water for injection. Diluted solution should be used within 24 hours and may be stored at room temperature or under refrigeration. Although, it is chemically and physically stable when diluted as recommended, sterile precautions should be observed because diluents generally do not contain preservatives.

ContraindicationsHypersensitivity to fomepizole, other pyrazoles, or any component of the formulation

Warnings/Precautions

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; metabolized in the liver.
- Renal impairment: Use with caution in patients with renal impairment; excreted in the urine; dialysis should be considered in addition to fomepizole in the case of renal failure, significant or worsening metabolic acidosis, or ethylene glycol/methanol levels ≥50 mg/dL.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Administration: Should not be given undiluted or by bolus injection.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted; use in pregnant women only if the benefits clearly outweigh the risks.

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

>10%:

Central nervous system: Headache (14%)

Gastrointestinal: Nausea (11%)

1% to 10% (≤3% unless otherwise noted):

Cardiovascular: Bradycardia, facial flush, hypotension, shock, tachycardia

Central nervous system: Dizziness (6%), drowsiness increased (6%), agitation, anxiety, lightheadedness, seizure, vertigo

Dermatologic: Rash

Gastrointestinal: Bad/metallic taste (6%), abdominal pain, appetite decreased, diarrhea, heartburn, vomiting

Hematologic: Anemia, disseminated intravascular coagulation (DIC), eosinophilia, lymphangitis

Hepatic: Liver function tests increased

Local: Application site reaction, injection site inflammation, pain during injection, phlebitis

Neuromuscular & skeletal: Backache

Ocular: Nystagmus, transient blurred vision, visual disturbances

Renal: Anuria

Respiratory: Abnormal smell, hiccups, pharyngitis

Miscellaneous: Multiorgan failure, speech disturbances

Postmarketing and/or case reports: Mild allergic reactions (mild rash, eosinophilia)

Drug InteractionsThere are no known significant interactions.

Ethanol/Nutrition/Herb InteractionsEthanol: Ethanol decreases the rate of fomepizole elimination by ~50%; conversely, fomepizole decreases the rate of elimination of ethanol by ~40%.

Monitoring ParametersFomepizole plasma levels should be monitored; response to fomepizole; monitor plasma/urinary ethylene glycol or methanol levels, urinary oxalate (ethylene glycol), plasma/urinary osmolality, renal/hepatic function, serum electrolytes, arterial blood gases; anion and osmolar gaps, resolution of clinical signs and symptoms of ethylene glycol or methanol intoxication

Reference RangeThe manufacturer recommends concentrations 100-300 µmol/L (8.2-24.6 mg/L) to achieve enzyme inhibition of alcohol dehydrogenase; according to practice guidelines, serum fomepizole concentrations of ≥0.8 mg/L provide constant inhibition of alcohol dehydrogenase

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]: 1 g/mL (1.5 mL)

Antizol®: 1 g/mL (1.5 mL)

Generic AvailableYes

ManufacturerOrphan Medical, Inc

Mechanism of ActionFomepizole competitively inhibits alcohol dehydrogenase, an enzyme which catalyzes the metabolism of ethanol, ethylene glycol, and methanol to their toxic metabolites. Ethylene glycol is metabolized to glycoaldehyde, then oxidized to glycolate, glyoxylate, and oxalate. Glycolate and oxalate are responsible for metabolic acidosis and renal damage. Methanol is metabolized to formaldehyde, then oxidized to formic acid. Formic acid is responsible for metabolic acidosis and visual disturbances.

Pharmacodynamics/Kinetics

Onset of effect: Peak effect: Maximum: 1.5-2 hours

Absorption: Oral: Readily absorbed

Distribution: V_d: 0.6-1.02 L/kg; rapidly into total body water

Protein binding: Negligible

Metabolism: Hepatic to 4-carboxypyrazole (80% to 85% of dose), 4-hydroxymethylpyrazole, and their N-glucuronide conjugates; following multiple doses, induces its own metabolism via CYP oxidases after 30-40 hours

Half-life elimination: Has not been calculated; varies with dose

Excretion: Urine (1% to 3.5% as unchanged drug and metabolites)

Pharmacotherapy PearlsAlternate therapies, including ethanol and hemodialysis, are difficult to use in children. Fomepizole's affinity for alcohol dehydrogenase is 8000 times greater than ethanol.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Bad/metallic taste.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness is common; may cause drowsiness

Mental Health: Effects on Psychiatric TreatmentNone reported

Anesthesia and Critical Care Concerns/Other Considerations Alternate therapies, including ethanol and hemodialysis, are difficult to use in children. Fomepizole's affinity for alcohol dehydrogenase is 8000 times greater than ethanol.

Index Terms 4-Methylpyrazole; 4-MP

International Brand Names Antizol (GB); Fomepizole AP-HP (FR)

Fomivirsen

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(foe MI vir sen)
U.S. Brand NamesVitravene™ [DSC]
Pharmacologic CategoryAntiviral Agent, Ophthalmic
Use: Labeled IndicationsLocal treatment of cytomegalovirus (CMV) retinitis in patients with acquired immunodeficiency syndrome who are intolerant or insufficiently responsive to other treatments for CMV retinitis or when other treatments for CMV retinitis are contraindicated
Dosing: AdultsCMV retinitis: Intravitreal injection: Induction: 330 mcg (0.05 mL) every other week for 2 doses, followed by maintenance dose of 330 mcg (0.05 mL) every 4 weeks

Note: If progression occurs during maintenance, a repeat of the induction regimen may be attempted to establish resumed control. Unacceptable inflammation during therapy may be managed by temporary interruption, provided response has been established. Topical corticosteroids have been used to reduce inflammation.

Dosing: ElderlyRefer to adult dosing.
StorageStore between 2°C to 25°C (35°F to 77°F). Protect from excessive heat or light.
ContraindicationsHypersensitivity to fomivirsen or any component
Warnings/Precautions

Concerns related to adverse effects:

- Increased intraocular pressure: Commonly increases intraocular pressure; monitoring is recommended.

- Uveitis: Occurs frequently, particularly during induction dosing.

Concurrent drug therapy issues:

- Cidofovir: Do not use in patients who have received intravenous or intravitreal cidofovir within 2-4 weeks; risk of exaggerated inflammation is increased.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: For ophthalmic use via intravitreal injection only. Patients should be monitored for CMV disease in the contralateral eye and/or extraocular disease.

Pregnancy ConsiderationsStudies have not been conducted in pregnant women. Should be used in pregnancy only when potential benefit to the mother outweighs the potential risk to the fetus.
LactationExcretion in breast milk unknown/contraindicated
Adverse Reactions

5% to 10%:

Central nervous system: Fever, headache

Gastrointestinal: Abdominal pain, diarrhea, nausea, vomiting

Hematologic: Anemia

Neuromuscular & skeletal: Asthenia

Ocular: Uveitis, abnormal vision, anterior chamber inflammation, blurred vision, cataract, conjunctival hemorrhage, visual acuity decreased, color vision loss, eye pain, intraocular pressure increased, photophobia, retinal detachment, retinal edema, retinal hemorrhage, retinal pigment changes, vitreitis

Respiratory: Pneumonia, sinusitis

Miscellaneous: Systemic CMV, sepsis, infection

2% to 5%:

Cardiovascular: Chest pain

Central nervous system: Confusion, depression, dizziness, neuropathy, pain

Endocrine & metabolic: Dehydration

Gastrointestinal: Abnormal LFTs, pancreatitis, anorexia, weight loss

Hematologic: Thrombocytopenia, lymphoma

Neuromuscular & skeletal: Back pain, cachexia

Ocular: Application site reaction, conjunctival hyperemia, conjunctivitis, corneal edema, decreased peripheral vision, eye irritation, keratic precipitates, optic neuritis, photopsia, retinal vascular disease, visual field defect, vitreous hemorrhage, vitreous opacity

Renal: Kidney failure

Respiratory: Bronchitis, dyspnea, cough

Miscellaneous: Allergic reaction, flu-like syndrome, diaphoresis increased

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersImmediately after injection, light perception and optic nerve head perfusion should be monitored. Anterior chamber paracentesis may be necessary if perfusion is not complete within 7-10 minutes after injection. Subsequent patient evaluation should include monitoring for contralateral CMV infection or extraocular CMV disease, and intraocular pressure prior to each injection.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Injection, solution, intravitreal, as sodium: 6.6 mg/mL (0.25 mL) [DSC]

Generic AvailableNo

Mechanism of ActionInhibits synthesis of viral protein by binding to mRNA which blocks replication of cytomegalovirus through an antisense mechanism

Pharmacodynamics/KineticsPharmacokinetic studies have not been conducted in humans. In animal models, the drug is cleared from the eye after 7-10 days. It is metabolized by sequential nucleotide removal, with a small amount of the radioactivity from a dose appearing in the urine.

Pharmacotherapy PearlsBecause the mechanism of action of fomivirsen is different than other antiviral agents active against CMV, fomivirsen may be active against isolates resistant to ganciclovir, foscarnet, or cidofovir. The converse may also be true.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause confusion, depression, or dizziness

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsFomivirsen Sodium

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(fon da PARE i nuks)

U.S. Brand NamesArixtra®

Canadian Brand NamesArixtra®

Pharmacologic CategoryFactor Xa Inhibitor

Use: Labeled IndicationsProphylaxis of deep vein thrombosis (DVT) in patients undergoing surgery for hip replacement, knee replacement, hip fracture (including extended prophylaxis following hip fracture surgery), or abdominal surgery (in patients at risk for thromboembolic complications); treatment of acute pulmonary embolism (PE); treatment of acute DVT without PE

Note: Additional Canadian approvals (not approved in U.S.): Unstable angina or non-ST segment elevation myocardial infarction (UA/NSTEMI) for the prevention of death and subsequent MI; ST segment elevation MI (STEMI) for the prevention of death and myocardial reinfarction

Use: Unlabeled/InvestigationalProphylaxis of DVT in patients with a history of heparin-induced thrombocytopenia (HIT)

Dosing: Adults

DVT prophylaxis: SubQ: Adults ≥50 kg: 2.5 mg once daily.

DVT prophylaxis with history of HIT (unlabeled use): 2.5 mg once daily.

Note: Initiate dose after hemostasis has been established, 6-8 hours postoperatively.

Usual duration: 5-9 days (up to 10 days following abdominal surgery or up to 11 days following hip replacement or knee replacement).

Extended prophylaxis is recommended following hip fracture surgery (has been tolerated for up to 32 days).

Acute DVT/PE treatment: SubQ: **Note:** Concomitant treatment with warfarin sodium should be initiated as soon as possible, usually within 72 hours:

<50 kg: 5 mg once daily

50-100 kg: 7.5 mg once daily

>100 kg: 10 mg once daily

Usual duration: 5-9 days (has been administered up to 26 days)

Canadian labeling only: Adults:

UA/NSTEMI: SubQ: 2.5 mg once daily; initiate as soon as possible after diagnosis; treat for up to 8 days or until hospital discharge.

STEMI: I.V.: 2.5 mg once; subsequent doses: SubQ: 2.5 mg once daily; treat for up to 8 days or until hospital discharge

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} 30-50 mL/minute: Use caution

Cl_{cr} <30 mL/minute: Contraindicated

Calculations

- Creatinine Clearance: Adults

Administration: I.M.Do not administer I.M.

Administration: I.V.**Canadian labeling only:** STEMI patients: I.V. push or mixed in 25-50 mL of NS and infused over 1-2 minutes. Flush tubing with NS after infusion to ensure complete administration of fondaparinux. Infusion bag should not be mixed with other agents.

Administration: OtherFor SubQ administration only. Do not mix with other injections or infusions. Do not expel air bubble from syringe before injection. Administer according to recommended regimen; early initiation (before 6 hours after surgery) has been associated with increased bleeding.

StorageStore at 15°C to 30°C (59°F to 86°F).

Canadian labeling: For I.V. administration: Manufacturer recommends immediate use once diluted in NS, but is stable for up to 24 hours at 15°C to 30°C (59°F to 86°F).

ReconstitutionCanadian labeling: For I.V. administration: May mix with 25 mL or 50 mL NS
Compatibility

Do not mix with other injections or infusions.

Canadian labeling: Stable in NS

ContraindicationsHypersensitivity to fondaparinux or any component of the formulation; severe renal impairment (Cl_{cr} <30 mL/minute); body weight <50 kg (prophylaxis); active major bleeding; bacterial endocarditis; thrombocytopenia associated with a positive *in vitro* test for antiplatelet antibody in the presence of fondaparinux
Allergy Considerations

- Fondaparinux Allergy

Warnings/Precautions

Boxed warnings:

- Neuraxial anesthesia: See "Other warnings/precautions" below.

Concerns related to adverse effects:

- Bleeding: Monitor patient closely for signs or symptoms of bleeding. Certain patients are at increased risk of bleeding. Risk factors include bacterial endocarditis; congenital or acquired bleeding disorders; active ulcerative or angiodysplastic GI diseases; severe uncontrolled hypertension; hemorrhagic stroke; or use shortly after brain, spinal, or ophthalmology surgery; in patient treated concomitantly with platelet inhibitors; recent GI bleeding; thrombocytopenia or platelet defects; severe liver disease; hypertensive or diabetic retinopathy; or in patients undergoing invasive procedures. Risk of major bleeding may be increased if initial dose is administered earlier then recommended (initiation recommended at 6-8 hours following surgery). Discontinue if bleeding occurs.

Disease-related concerns:

- Renal impairment: Use with caution in patients with moderate renal dysfunction (Cl_{cr} 30-50 mL/minute). Patients with serum creatinine >2 mg/dL were excluded from clinical trials. Periodically monitor renal function; discontinue if severe dysfunction or labile function develops.

Special populations:

- Elderly: Use with caution in the elderly.

- Patients <50 kg: Use with caution in patients <50 kg who are being treated for DVT/PE; fondaparinux clearance may be decreased. Dosage reduction recommended.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- **Canadian labeling warnings/precautions:** The administration of fondaparinux is not recommended prior to and during primary percutaneous coronary intervention (PCI) for reperfusion in STEMI patients, due to an increased risk for guiding catheter thrombosis. UA/NSTEMI and STEMI patients undergoing any PCI should not receive fondaparinux as a sole anticoagulant agent. Use of an antithrombin regimen (eg, unfractionated heparin) is recommended as adjunctive therapy to PCI. Following sheath removal, fondaparinux therapy should not resume for at least 2 hours in UA/NSTEMI patients and 3 hours in STEMI patients. Use caution in UA/NSTEMI/STEMI patients <50 kg. Avoid administration 24 hours before and 48 hours after coronary artery bypass graft (CABG) surgery.

- Neuraxial anesthesia: **[U.S. Boxed Warning]: Patients with recent or anticipated neuraxial anesthesia (epidural or spinal anesthesia) are at risk of spinal or epidural hematoma and subsequent paralysis.** Consider risk versus benefit prior to neuraxial anesthesia; risk is increased by concomitant agents which may alter hemostasis, as well as traumatic or repeated epidural or spinal puncture. Patient should be observed closely for bleeding and signs and symptoms of neurological impairment if therapy is administered during or immediately following diagnostic lumbar puncture, epidural anesthesia, or spinal anesthesia.

Geriatric ConsiderationsPatients studied for DVT prophylaxis following elective knee or hip fracture surgery averaged 67.5 and 77 years of age, respectively. Use with caution in patients with estimated or actual creatinine clearance between 30-50 mL/minute. Contraindicated in patients with Cl_{cr} <30 mL/minute.
Pregnancy Risk FactorB
Pregnancy ConsiderationsReproductive animal studies have not shown fetal harm. Based on case reports, small amounts of fondaparinux have been detected in the umbilical cord following multiple doses during pregnancy. There are no adequate and well-controlled studies in pregnant women; use only if clearly needed.
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsAs with all anticoagulants, bleeding is the major adverse effect. Hemorrhage may occur at any site. Risk appears increased by a number of factors including renal dysfunction, age (>75 years), and weight (<50 kg).

>10%:

Central nervous system: Fever (4% to 14%)

Gastrointestinal: Nausea (11%)

Hematologic: Anemia (20%)

1% to 10%:

- Cardiovascular: Edema (9%), hypotension (4%), thrombosis PCI catheter (without heparin 1%)
- Central nervous system: Insomnia (5%), dizziness (4%), headache (2% to 5%), confusion (3%), pain (2%)
- Dermatologic: Rash (8%), purpura (4%), bullous eruption (3%)
- Endocrine & metabolic: Hypokalemia (1% to 4%)
- Gastrointestinal: Constipation (5% to 9%), nausea (3%), vomiting (6%), diarrhea (3%), dyspepsia (2%)
- Genitourinary: Urinary tract infection (4%), urinary retention (3%)
- Hematologic: Moderate thrombocytopenia (50,000-100,000/mm^3: 3%), major bleeding (1% to 3%), minor bleeding (2% to 4%), hematoma (3%); risk of major bleeding increased as high as 5% in patients receiving initial dose <6 hours following surgery
- Hepatic: ALT increased (3%), AST increased (2%)
- Local: Injection site reaction (bleeding, rash, pruritus)
- Miscellaneous: Wound drainage increased (5%)

<1%: Heparin-induced thrombocytopenia (1 case report), hepatic enzymes increased, severe thrombocytopenia (<50,000/mm^3)

Drug Interactions

Anticoagulants: May enhance the anticoagulant effect of other Anticoagulants. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Dasatinib: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Drotrecogin Alfa: May enhance the adverse/toxic effect of Fondaparinux. Bleeding may occur. *Risk D: Consider therapy modification*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Anticoagulants. Bleeding may occur. *Risk D: Consider therapy modification*

Ibritumomab: Anticoagulants may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to an increased risk of bleeding. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the adverse/toxic effect of Anticoagulants. Specifically, the antiplatelet effects of these agents may lead to an increased risk of bleeding with the combination. *Risk C: Monitor therapy*

Salicylates: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Thrombolytic Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Anticoagulants may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse effects may be increased. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid alfalfa, anise, bilberry, bladderwrack, bromelain, cat's claw, celery, coleus, cordyceps, dong quai, evening primrose oil, fenugreek, feverfew, garlic, ginger, ginkgo biloba, ginseng (American/Panax/Siberian), grapeseed, green tea, guggul, horse chestnut seed, horseradish, licorice, prickly ash, red clover, reishi, sweet clover, turmeric, white willow (all possess anticoagulant or antiplatelet activity and as such, may enhance the anticoagulant effects of fondaparinux).

Test InteractionsInternational standards of heparin or LMWH are not the appropriate calibrators for antifactor Xa activity of fondaparinux.

Monitoring ParametersPeriodic monitoring of CBC, serum creatinine, occult blood testing of stools recommended. Antifactor Xa activity of fondaparinux can be measured by the assay if fondaparinux is used as the calibrator. PT and aPTT are insensitive measures of fondaparinux activity.

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking (especially anything that will affect coagulation or platelet function). Assess closely for bleeding; bleeding precautions should be observed. Assess results of laboratory tests, therapeutic effectiveness, and adverse response regularly during therapy. Teach appropriate use, including appropriate injection technique and syringe/needle disposal. Teach patient possible side effects/appropriate interventions (eg, bleeding precautions) and adverse symptoms to report.

Monitoring: Lab TestsCBC, platelet count, serum creatinine; stool occult blood tests

Patient EducationDo not take any new medication during therapy without consulting prescriber. This drug can only be administered by injection. Report pain, burning, redness, or swelling at injection site. You may have a tendency to bleed easily while taking this drug (brush teeth with soft brush, floss with waxed floss, use electric razor, avoid scissors or sharp knives, and avoid potentially harmful activities). May cause nausea or vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or dizziness, headache, insomnia (use caution when driving or engaging in tasks that require alertness until response to drug is known). Report unusual bleeding or bruising (bleeding gums, nosebleed, blood in urine, dark stool); pain in joints or back; CNS changes (fever, severe headache, confusion); unusual fever; persistent nausea or GI upset; changes in urinary pattern; or other persistent adverse response. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as sodium [preservative free]: 2.5 mg/0.5 mL (0.5 mL); 5 mg/0.4 mL (0.4 mL); 7.5 mg/0.6 mL (0.6 mL); 10 mg/0.8 mL (0.8 mL) [prefilled syringe]

Generic AvailableNo

ManufacturerOrganon/Sanofi-Synthelabo LLC

Pricing: U.S. (www.drugstore.com)

Solution (Arixtra)

2.5 mg/0.5 mL (5): $537.88

7.5 mg/0.6 mL (0.6): $127.06

Mechanism of ActionFondaparinux is a synthetic pentasaccharide that causes an antithrombin III-mediated selective inhibition of factor Xa. Neutralization of factor Xa interrupts the blood coagulation cascade and inhibits thrombin formation and thrombus development.

Pharmacodynamics/Kinetics

Absorption: SubQ: Rapid and complete

Distribution: V_d: 7-11 L; mainly in blood

Protein binding: ≥94% to antithrombin III

Bioavailability: SubQ: 100%

Half-life elimination: 17-21 hours; prolonged with worsening renal impairment

Time to peak: SubQ: 2-3 hours

Excretion: Urine (as unchanged drug); decreased clearance in patients <50 kg

Related Information

- Anticoagulants, Injectable

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Hemorrhage may occur at any site; risk increased in renal dysfunction, patients >75 years and/or <50 kg; major bleeding increased as high as 5% in patients receiving initial dose <6 hours postsurgery.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness or insomnia

Mental Health: Effects on Psychiatric TreatmentMay cause thrombocytopenia; use caution with valproic acid

Cardiovascular ConsiderationsThe OASIS-5 trial is an international, randomized, double-blind trial in patients with non-ST segment elevation acute coronary syndrome who were randomized to fondaparinux (2.5 mg SubQ once daily) versus enoxaparin (1 mg/kg SubQ twice daily). If patients in the fondaparinux arm had PCI, then route and dose were adjusted. If PCI <6 hours and GPIIb/IIIa **was not** used, fondaparinux 2.5 mg I.V. was administered. If PCI <6 hours and GPIIb/IIIa **was** used, no fondaparinux was administered. If PCI >6 hours, fondaparinux was adjusted based on concurrent GPIIb/IIIa use. If a GPIIb/IIIa was used, fondaparinux was administered at 2.5 mg I.V., while fondaparinux 5 mg was administered in patients without concurrent GP IIb/IIIa. In the enoxaparin arm, if PCI <6 hours, then no additional unfractionated heparin (UFH) was used. If PCI >6 hours, I.V. UFH was used (doses varied depending on use of GPIIb/IIIa). The primary outcome was a composite of death, MI, refractory ischemia, and major bleeds at 9 days. Patients were also evaluated at 1 month and 6 months for these endpoints. Over 20,000 patients were enrolled. Patients were excluded if they had any contraindications to enoxaparin, had a hemorrhagic stroke <12 months ago, or serum creatinine >3 mg/dL. The primary efficacy outcome (death, MI, refractory ischemia) at day 9 was similar for both treatment arms. Major bleeding at day 9 was significantly less for fondaparinux (2.1%) than enoxaparin (4%). At one month and at 6 months, there is a significant reduction in mortality with fondaparinux.

Special Alerts

Public Health Advisory: Formoterol and Tiotropium Capsules for Inhalation - February 2008

The U.S. Food and Drug Administration (FDA) has issued a Public Health Advisory emphasizing the correct administration of formoterol (Foradil®) capsules and tiotropium (Spiriva®) capsules. The capsules for both medications contain powder intended for inhalation via their respective inhalation devices: Aerolizer™ (Foradil®) and HandiHaler® (Spiriva®). There have been numerous reports of patients *swallowing* the capsule, including some reports of patients experiencing side effects from the swallowed capsules. The FDA is reminding healthcare professionals to discuss with patients the correct administration of the capsules via the inhalation device and **not** to swallow the capsules.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Spiriva

Medication Safety Issues

Sound-alike/look-alike issues:

Foradil® may be confused with Toradol®

Foradil® capsules for inhalation are for administration via Aerolizer™ inhaler and are **not** for oral use.

International issues:

Foradil® may be confused with Theradol® which is a brand name for tramadol in the Netherlands.

Pronunciation(for MOH te rol)

U.S. Brand NamesForadil® Aerolizer®; Perforomist™

Canadian Brand NamesForadil®; Oxeze® Turbuhaler®

Pharmacologic CategoryBeta$_2$ Agonist

Use: Labeled IndicationsMaintenance treatment of asthma and prevention of bronchospasm in patients ≥5 years of age with reversible obstructive airway disease, including patients with symptoms of nocturnal asthma, who require regular treatment with inhaled, short-acting beta$_2$-agonists; maintenance treatment of bronchoconstriction in patients with COPD; prevention of exercise-induced bronchospasm in patients ≥5 years of age

Note:

Oxeze® is also approved in Canada for acute relief of symptoms ("on demand" treatment) in patients ≥6 years of age.

Perforomist™ is only indicated for maintenance treatment of bronchoconstriction in patients with COPD.

Dosing: Adults

Asthma, maintenance: Inhalation:

Foradil®: 12 mcg capsule inhaled every 12 hours via Aerolizer™ device

Oxeze® (CAN): **Note:** Not labeled for use in the U.S.: Inhalation: 6 mcg or 12 mcg every 12 hours. Maximum dose: Children: 24 mcg/day; Adults: 48 mcg/day

Exercise-induced bronchospasm: Inhalation:

Foradil®: 12 mcg capsule inhaled via Aerolizer™ device at least 15 minutes before exercise on an "as needed" basis; additional doses should not be used for another 12 hours. **Note:** If already using for asthma maintenance then should not use additional doses for exercise-induced bronchospasm.

Oxeze® (CAN): **Note:** Not labeled for use in the U.S.: Children ≥6 years and Adults: Inhalation: 6 mcg or 12 mcg at least 15 minutes before exercise.

COPD (maintenance): Inhalation:

Foradil®: 12 mcg capsule inhaled every 12 hours via Aerolizer™ device

Perforomist™: 20 mcg twice daily (maximum dose: 40 mcg/day)

Acute ("on demand") relief of bronchoconstriction: *Indication for Oxeze® approved in Canada:* 6 mcg or 12 mcg as a single dose (maximum dose: 72 mcg in any 24-hour period). The prolonged use of high dosages (48 mcg/day for ≥3 consecutive days) may be a sign of suboptimal control, and should prompt the re-evaluation of therapy.

Dosing: Elderly

Refer to adult dosing.

Dosing: Pediatric

Asthma maintenance (Foradil®): Inhalation: Children ≥5 years: Refer to adult dosing.

Exercise-induced bronchospasm (Foradil®): Inhalation: Children ≥5 years: Refer to adult dosing.

Acute "on demand" treatment of bronchospasm (Oxeze® [CAN]): Inhalation: Refer to adult dosing.

Dosing: Renal Impairment

Not studied

Administration: Inhalation

Foradil®: Remove capsule from foil blister **immediately** before use. Place capsule in the capsule-chamber in the base of the Aerolizer™ Inhaler. Must only use the Aerolizer™ Inhaler. Press both buttons **once only** and then release. Keep inhaler in a level, horizontal position. Exhale fully. Do not exhale into inhaler. Tilt head slightly back and inhale (rapidly, steadily, and deeply). Hold breath as long as possible. If any powder remains in capsule, exhale and inhale again. Repeat until capsule is empty. Throw away empty capsule; do not leave in inhaler. Do not use a spacer with the Aerolizer™ Inhaler. Always keep capsules and inhaler dry.

Perforomist™: Remove unit-dose vial from foil pouch **immediately** before use. Solution does not require dilution prior to administration; do not mix other medications with formoterol solution. Place contents of unit-dose vial into the reservoir of a standard jet nebulizer connected to an air compressor; assemble nebulizer based on the manufacturer's instructions and turn nebulizer on; breathe deeply and evenly until all of the medication has been inhaled. Discard any unused medication immediately; do not ingest contents of vial. Clean nebulizer after use.

Storage

Foradil®: Prior to dispensing, store in refrigerator at 2°C to 8°C (36°F to 46°F). After dispensing, store at room temperature at 20°C to 25°C (68°F to 77°F). Protect from heat and moisture. Capsules should always be stored in the blister and only removed immediately before use. Always check expiration date. Use within 4 months of purchase date or product expiration date, whichever comes first.

Perforomist™: Prior to dispensing, store in refrigerator at 2°C to 8°C (36°F to 46°F). After dispensing, store at 2°C to 25°C (36°F to 77°F) for up to 3 months. Protect from heat. Unit-dose vials should always be stored in the foil pouch and only removed immediately before use.

Restrictions

An FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

Contraindications

Foradil®: Hypersensitivity to formoterol, or any component of the formulation

Oxeze®: Hypersensitivity to formoterol, inhaled lactose, or any component of the formulation; presence of tachyarrhythmias

Perforomist™: No contraindications listed in the product labeling

Warnings/Precautions

Boxed warnings:

- Asthma-related deaths: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Asthma-related deaths: **[U.S. Boxed Warning]: Long-acting beta$_2$-agonists may increase the risk of asthma-related deaths.** In a large, randomized clinical trial (SMART, 2006), salmeterol was associated with a small, but statistically significant, increase in asthma-related deaths (when added to usual asthma therapy); risk may be greater in African-American patients versus Caucasians.

- Bronchospasm: Rarely, paradoxical bronchospasm may occur with use of inhaled bronchodilating agents; this should be distinguished from inadequate response.

- Hypersensitivity reactions: Immediate hypersensitivity reactions (urticaria, angioedema, rash, bronchospasm) have been reported.

- Serious effects/fatalities: Do not exceed recommended dose or frequency; serious adverse events, including fatalities, have been associated with excessive use of inhaled sympathomimetics.

Disease-related concerns:

- Asthma: Appropriate use:

  Foradil®: Should only be used as adjuvant therapy in patients not adequately controlled on other asthma medications (eg, low-to-medium dose inhaled corticosteroids) or whose disease warrants initiation of two maintenance therapies. Optimize anti-inflammatory treatment before initiating maintenance treatment with formoterol. Do not use as a component of chronic therapy without an anti-inflammatory agent. Corticosteroids should not be stopped or reduced at formoterol initiation. Acute episodes should be treated with a rapid-onset beta$_2$-agonist.

  Perforomist™: The safety and efficacy of Perforomist™ in the treatment of asthma have not been established.

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (arrhythmia, coronary insufficiency, hypertension, or

HF); beta-agonists may cause elevation in blood pressure and heart rate and result in CNS stimulation/excitation. Beta$_2$-agonists may also increase risk of arrhythmias and prolong QT$_c$ interval.

- Chronic obstructive pulmonary disease (COPD), acute: Formoterol should not be used for the treatment of rapidly deteriorating COPD or for acute symptomatic COPD; increased use and/or ineffectiveness of short-acting beta$_2$-agonists may indicate rapidly deteriorating disease and should prompt re-evaluation of the patient's condition.

- Diabetes: Use with caution in patients with diabetes mellitus; beta$_2$-agonists may increase serum glucose.

- Glaucoma: Use with caution in patients with glaucoma; may elevate intraocular pressure.

- Hyperthyroidism: Use with caution in hyperthyroidism; may stimulate thyroid activity.

- Hypokalemia: Use with caution in patients with hypokalemia; beta$_2$-agonists may decrease serum potassium.

- Seizures: Use with caution in patients with seizure disorders; beta-agonists may result in CNS stimulation/excitation.

Special populations:

- Pediatrics:

  Foradil®: Safety and efficacy have not been established in children <5 years of age.

  Perforomist™: Safety and efficacy have not been established in children <18 years of age.

Dosage form specific issues:

- Foradil®: The contents of the capsules are for inhalation via the Aerolizer™ device. There have been reports of incorrect administration (swallowing of the capsules).

- Lactose: Powder for oral inhalation contains lactose; very rare anaphylactic reactions have been reported in patients with severe milk protein allergy.

- Oxeze®: Oxeze® is a formulation of formoterol (available outside the U.S. [eg, Canada]) approved for acute treatment of asthmatic symptoms. The labelings for U.S. approved formulations (Foradil®, Perforomist™) state that formoterol is not meant to relieve acute asthmatic symptoms.

Other warnings/precautions:

- Patient information: Patients using inhaled, short-acting beta$_2$-agonists should be instructed to discontinue routine use of these medications prior to beginning treatment; short-acting agents should still be provided to patients; however, use should be reserved for symptomatic relief of acute symptoms. Patients must be instructed to seek medical attention in cases where acute symptoms are not relieved or a previous level of response is diminished. The need to increase frequency of use may indicate deterioration of asthma or COPD, and treatment must not be delayed.

Geriatric ConsiderationsElderly patients should be specifically counseled about the proper use of this inhaler/spacing of doses and/or the proper use of a nebulizer system. No significant difference in both safety and effectiveness was seen between elderly and younger patients.

Pregnancy Risk FactorC

Pregnancy ConsiderationsWhen given orally to rats throughout organogenesis, formoterol caused delayed ossification and decreased fetal weight, but no malformations. There were no adverse events when given to pregnant rats in late pregnancy. Doses used were ≥70 times the recommended daily inhalation dose in humans. There are no adequate and well-controlled studies in pregnant women. Use only if benefit outweighs risk to the fetus. Beta-agonists interfere with uterine contractility so use during labor only if benefit outweighs risk to the fetus.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

1% to 10%:

Cardiovascular: Chest pain (2%), palpitation

Central nervous system: Anxiety (2%), dizziness (2%), fever (2%), insomnia (2%), dysphonia (1%), headache

Dermatologic: Rash (1%)

Gastrointestinal: Diarrhea (5%), nausea (5%), xerostomia (1% to 3%), vomiting (2%), abdominal pain, dyspepsia, gastroenteritis

Neuromuscular & skeletal: Tremor

Respiratory: Asthma exacerbation (age 5-12 years: 5% to 6%; age >12 years: <4%), bronchitis (5%), infection (3% to 7%), pharyngitis (3% to 4%), sinusitis (3%), dyspnea (2%), tonsillitis (1%)

<1%: Acute asthma deterioration, anaphylactic reactions (severe hypotension/angioedema), agitation, angina, arrhythmia, bronchospasm (paradoxical), fatigue, hyperglycemia, hypertension, hypokalemia, glucose intolerance, malaise, metabolic acidosis, muscle cramps, nervousness, tachycardia

Metabolism/Transport Effects**Substrate** (minor) of CYP2A6, 2C9, 2C19, 2D6

Drug Interactions

Alpha-/Beta-Blockers: May diminish the therapeutic effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Atomoxetine: May enhance the tachycardic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Beta-Blockers (Beta1 Selective): May diminish the bronchodilatory effect of Beta2-Agonists. Of particular concern with nonselective beta-blockers or higher doses of the beta1 selective beta-blockers. *Risk C: Monitor therapy*

Beta-Blockers (Nonselective): May diminish the bronchodilatory effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Betahistine: May diminish the therapeutic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Monitoring ParametersFEV$_1$, peak flow, and/or other pulmonary function tests; blood pressure, heart rate; CNS stimulation; serum glucose, serum potassium

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Monitor therapeutic effectiveness and adverse reactions at beginning of therapy and periodically throughout period of therapy. Assess knowledge/teach appropriate use of medication, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsFEV$_1$, peak flow, and/or other pulmonary function tests; serum potassium, serum glucose (in selected patients)

Patient EducationDo not swallow capsules; this medication can only be used in the Aerolizer™ Inhaler. Use exactly as directed and do not use more often than recommended. Store capsules in blister and do not remove from blister until ready for treatment. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. It is recommended that you wear identification (Med-Alert bracelet) if you have an asthmatic condition. You may experience nervousness, dizziness, or insomnia (use caution when driving or engaging in hazardous activities until response to medication is known); dry mouth, nausea, or GI discomfort (small frequent meals, good mouth care, sucking lozenges, or chewing gum may help); or difficulty voiding (always void before treatment). Report any unresolved GI upset, nervousness or dizziness, muscle cramping, chest pain or palpitations, skin rash, signs of infection, unusual cough, or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Administration: Follow directions for use and storage of inhaler exactly. Wash hands prior to treatment and sit in comfortable position for treatment. Remove capsule from foil blister immediately before treatment and place capsule in the capsule-chamber in the base of the Aerolizer™ Inhaler. Press both buttons once only and then release. Hold inhaler in a level, horizontal position, exhale fully (do not exhale into inhaler). Tilt head slightly back and inhale from inhaler rapidly, steadily, and deeply. Hold breath as long as possible. If any powder remains in capsule, exhale and inhale again. Repeat until capsule is empty. Throw away empty capsule. Do not use a spacer with Aerolizer™. Do not wash inhaler; store in dry place.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Powder for oral inhalation, as fumarate:

Foradil® Aerolizer™ [capsule]: 12 mcg (12s, 60s) [contains lactose 25 mg]

Oxeze® Turbuhaler® [CAN]: 6 mcg/inhalation [delivers 60 metered doses; contains lactose 600 mcg/dose]; 12 mcg/inhalation [delivers 60 metered doses; contains lactose 600 mcg/dose] [not available in the U.S.]

Solution for nebulization, as fumarate dihydrate:

Perforomist™: 20 mcg/2 mL (2 mL)

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Capsules (Foradil Aerolizer)

12 mcg (60): $148.72

Mechanism of ActionRelaxes bronchial smooth muscle by selective action on beta$_2$ receptors with little effect on heart rate. Formoterol has a long-acting effect.

Pharmacodynamics/Kinetics

Onset of action: Within 3 minutes

Peak effect: 80% of peak effect within 15 minutes

Duration: Improvement in FEV$_1$ observed for 12 hours in most patients

Absorption: Rapidly into plasma

Protein binding: 61% to 64% *in vitro* at higher concentrations than achieved with usual dosing

Metabolism: Hepatic via direct glucuronidation and O-demethylation; CYP2D6, CYP2C8/9, CYP2C19, CYP2A6 involved in O-demethylation

Half-life elimination: Powder: ~10-14 hours; Nebulized solution: ~7 hours

Time to peak: Maximum improvement in FEV$_1$ in 1-3 hours

Excretion:

Children 5-12 years: Urine (7% to 9% as direct glucuronide metabolites, 6% as unchanged drug)

Adults: Urine (15% to 18% as direct glucuronide metabolites, 2% to 10% as unchanged drug)

Related Information

- Inhalant Agents

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness or insomnia

Mental Health: Effects on Psychiatric TreatmentConcurrent use with MAO inhibitors, TCAs, thioridazine, or mesoridazine may potentiate cardiovascular effects

Index TermsFormoterol Fumarate; Formoterol Fumarate Dihydrate

Pronunciation(FOS am pren a veer)

U.S. Brand NamesLexiva®

Canadian Brand NamesTelzir®

Pharmacologic CategoryAntiretroviral Agent, Protease Inhibitor

Use: Labeled IndicationsTreatment of HIV infections in combination with at least two other antiretroviral agents

Dosing: Adults

HIV infection: Oral:

Antiretroviral therapy-naive patients:

Unboosted regimen: 1400 mg twice daily (without ritonavir)

Ritonavir-boosted regimens:

- Once-daily regimen: Fosamprenavir 1400 mg plus ritonavir 100-200 mg once daily
- Twice-daily regimen: Fosamprenavir 700 mg plus ritonavir 100 mg twice daily

Protease inhibitor-experienced patients: Fosamprenavir 700 mg plus ritonavir 100 mg twice daily. **Note:** Once-daily administration is not recommended in protease inhibitor-experienced patients.

Combination therapy with efavirenz (ritonavir-boosted regimen):

Once-daily regimen: Fosamprenavir 1400 mg daily plus ritonavir 300 mg once daily

Twice-daily regimen: No dosage adjustment recommended for twice-daily regimen

Combination therapy with nevirapine (ritonavir-boosted regimen): Fosamprenavir 700 mg plus ritonavir 100 mg twice daily

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

HIV infection: Oral:

Antiretroviral therapy-naive patients:

Children 2-5 years of age: Fosamprenavir 30 mg/kg twice daily (not to exceed adult dosage of 1400 mg twice daily)

Children ≥6 years of age:

- Unboosted regimen: Fosamprenavir 30 mg/kg twice daily (not to exceed adult dosage of 1400 mg twice daily)
- Ritonavir-boosted regimen: Fosamprenavir 18 mg/kg twice daily plus ritonavir 3 mg/kg twice daily (not to exceed the adult dose of 700 mg plus ritonavir 100 mg twice daily)

Protease inhibitor-experienced patients: Children ≥6 years: Fosamprenavir 18 mg/kg plus ritonavir 3 mg/kg twice daily (not to exceed the adult dose of 700 mg plus ritonavir 100 mg twice daily)

Notes: The adult regimen of 1400 mg twice daily may be used for pediatric patients who weigh ≥47 kg. When combined with ritonavir, fosamprenavir tablets may be administered to children who weigh ≥39 kg while ritonavir capsules may be used for pediatric patients who weigh ≥33 kg.

Dosing: Renal ImpairmentNo dosage adjustment required.

Dosing: Hepatic Impairment

Mild impairment (Child-Pugh score 5-6): Reduce dosage of fosamprenavir to 700 mg twice daily without concurrent ritonavir (therapy naive) or fosamprenavir 700 mg twice daily plus ritonavir 100 mg once daily (therapy naive or PI experienced)

Moderate impairment (Child-Pugh score 7-9): Reduce dosage of fosamprenavir to 700 mg twice daily without concurrent ritonavir (therapy naive) or fosamprenavir 450 mg twice daily plus ritonavir 100 mg once daily (therapy naive or PI experienced)

Severe impairment (Child-Pugh score 10-12): Reduce dosage of fosamprenavir to 350 mg twice daily without concurrent ritonavir (therapy naive).

No data concerning the use of fosamprenavir plus ritonavir are available in severe hepatic impairment.

Administration: Oral

Oral suspension: Administer **without** food to adults; administer **with** food to pediatric patients. Shake suspension vigorously prior to use.

Tablet: May be taken with or without food.

Dietary ConsiderationsTablets may be taken with or without food. Adults should take oral suspension without food, however, children should take oral suspension with food.

Storage

Lexiva®: Store tablets at controlled room temperature of 25°C (77°F). Store oral suspension at 5°C to 30°C (41°F to 86°F). Do not freeze.

Telzir®: Store tablets 2°C to 30°C; do not freeze and discard 25 days after opening.

ContraindicationsClinically-significant hypersensitivity (eg, Stevens-Johnson syndrome) to fosamprenavir, amprenavir, or any component of the formulation; concurrent therapy with CYP3A4 substrates with a narrow therapeutic window; concomitant use with cisapride, delavirdine, ergot derivatives, lovastatin, midazolam, pimozide, rifampin, simvastatin, St John's wort, and triazolam; use of flecainide and propafenone with concomitant ritonavir therapy

The Canadian product labeling of fosamprenavir (Telzir®) indicates that this product is contraindicated in severe hepatic impairment; in addition, concurrent therapy with potent inducers of CYP3A4 including rifampin is specifically contraindicated

Allergy Considerations

- Amprenavir Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Fat redistribution: May cause redistribution of fat (eg, buffalo hump, peripheral wasting with increased abdominal girth, cushingoid appearance).
- Hemolytic anemia: Acute hemolytic anemia has been reported in association with amprenavir use.
- Hypersensitivity reactions: Protease inhibitors have been associated with a variety of hypersensitivity events (some severe), including rash, anaphylaxis (rare), angioedema, bronchospasm, erythema multiforme, and/or Stevens-Johnson syndrome (rare). It is generally recommended to discontinue treatment if severe rash or moderate symptoms accompanied by other systemic symptoms occur.
- Immune reconstitution syndrome: Patients may develop immune reconstitution syndrome resulting in the occurrence of an inflammatory response to an indolent or residual opportunistic infection; further evaluation and treatment may be required.
- Increased cholesterol: Increases in total cholesterol and triglycerides have been reported; screening should be done prior to therapy and periodically throughout treatment.
- Sulfonamide allergy: Use with caution in patients with sulfonamide allergy. In clinical trials, the incidence of rash did not differ appreciably in patients with or without past history of sulfonamide allergy.

Disease-related concerns:

- Diabetes: Changes in glucose tolerance, hyperglycemia, exacerbation of diabetes, DKA, and new-onset diabetes mellitus have been reported in patients receiving protease inhibitors.
- Hemophilia A or B: Use with caution in patients with hemophilia A or B; increased bleeding during protease inhibitor therapy has been reported.
- Hepatic impairment: May cause transaminase elevations, hepatitis, and/or exacerbate pre-existing hepatic dysfunction; use with caution in patients with underlying hepatic disease, such as hepatitis B or C or cirrhosis. Dosage adjustment required in hepatic impairment.

Concurrent drug therapy issues:

- High potential for interactions: Use with caution in patients taking strong CYP3A4 inhibitors, moderate or strong CYP3A4 inducers, and major CYP3A4 substrates (see Drug Interactions); consider alternative agents that avoid or lessen the potential for CYP-mediated interactions.
- Contraceptive failure: Do not use with hormonal contraceptives (eg, ethinyl estradiol/norethindrone). Estrogen/progestin levels may be reduced with concomitant use; nonhormonal contraception is recommended.
- Toxicity: Use with hormonal contraceptives (eg, ethinyl estradiol/norethindrone) in combination with ritonavir may increase the risk of transaminase elevations; avoid use.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <2 years of age.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal data showed some abortifacient and minor skeletal abnormalities with amprenavir. It is not known if amprenavir crosses the human placenta. There are no adequate and well-controlled studies in pregnant women. Pregnancy and protease inhibitors are both associated with an increased risk of hyperglycemia. Glucose levels should be closely monitored. Health professionals are encouraged to contact the antiretroviral pregnancy registry to monitor outcomes of pregnant women exposed to antiretroviral medications (1-800-258-4263 or www.APRegistry.com).

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsHIV-infected mothers are discouraged from breast-feeding to decrease potential transmission of HIV.

Adverse ReactionsFrequency not defined: Fat redistribution, immune reconstitution syndrome have been associated with protease inhibitor therapy.

>10%:

Dermatologic: Rash (up to 19%; onset ~11 days; duration ~13 days)

Endocrine & metabolic: Hypertriglyceridemia (>750 mg/dL: up to 11%)

Gastrointestinal: Diarrhea (moderate-to-severe; 5% to 13%)

1% to 10%:

Central nervous system: Headache (moderate-to-severe; 2% to 4%), fatigue (moderate-to-severe; 2% to 4%)

Dermatologic: Pruritus (7% to 8%)

Endocrine & metabolic: Hyperglycemia (>251 mg/dL: <1% to 2%)

Gastrointestinal: Serum lipase increased (>2 times ULN: 5% to 8%), nausea (moderate-to-severe; 3% to 7%, vomiting (moderate-to-severe; 2% to 6%), abdominal pain (moderate-to-severe; 1% to 2%)

Hematologic: Neutropenia (<750 cells/mm^3: 3%)

Hepatic: Transaminases increased (>5 times ULN: 4% to 8%)

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Angioedema, Stevens-Johnson syndrome

Note: Spontaneous bleeding has been reported in patients with hemophilia A or B following treatment with protease inhibitors. Acute hemolytic anemia has been reported in association with amprenavir use.

Metabolism/Transport EffectsAs amprenavir: **Substrate** of CYP2C9 (minor), 3A4 (major); **Inhibits** CYP2C19 (weak), 3A4 (strong)

Drug Interactions

Abacavir: Protease Inhibitors may decrease the serum concentration of Abacavir. *Risk C: Monitor therapy*

Alfuzosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alfuzosin. *Risk X: Avoid combination*

Alosetron: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alosetron. *Risk C: Monitor therapy*

Amiodarone: Protease Inhibitors may decrease the metabolism of Amiodarone. *Risk X: Avoid combination*

Antacids: May decrease the absorption of Protease Inhibitors. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May increase the serum concentration of Protease Inhibitors. Protease Inhibitors may increase the serum concentration of Antifungal Agents (Azole Derivatives, Systemic). Management: Limit indinavir to 600mg every 8 hours with itraconazole or ketoconazole. When used with ritonavir, limit ketoconazole to 200mg/day. Tipranavir labeling recommends limiting fluconazole, itraconazole, and ketoconazole to 200mg with tipranavir/ritonavir. **Exceptions:** Miconazole. *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Protease Inhibitors may decrease the metabolism of Benzodiazepines (metabolized by oxidation). Management: Amprenavir, atazanavir, darunavir, indinavir, nelfinavir, ritonavir, and tipranavir are contraindicated with midazolam and triazolam according to each protease inhibitor's prescribing information. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Dihydropyridine): Protease Inhibitors may decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): Protease Inhibitors may decrease the metabolism of Calcium Channel Blockers (Nondihydropyridine). Increased serum concentrations of the calcium channel blocker may increase risk of AV nodal blockade. *Risk D: Consider therapy modification*

CarBAMazepine: May increase the metabolism of Protease Inhibitors. Protease Inhibitors may decrease the metabolism of CarBAMazepine. *Risk D: Consider therapy modification*

Ciclesonide: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ciclesonide. Specifically, concentrations of the active des-ciclesonide metabolite may be increased. *Risk C: Monitor therapy*

Cisapride: Protease Inhibitors may decrease the metabolism of Cisapride. The resultant increase in serum cisapride concentrations may result in QTc prolongation and malignant cardiac arrhythmias. *Risk X: Avoid combination*

Clarithromycin: Protease Inhibitors may diminish the therapeutic effect of Clarithromycin. Specifically, certain protease inhibitors may decrease formation of the active 14-hydroxy-clarithromycin metabolite, which may negatively impact clarithromycin effectiveness vs. H. influenzae and other non-MAC infections. Protease Inhibitors may increase the serum concentration of Clarithromycin. Clarithromycin dose adjustment in renally impaired patients may be needed. Clarithromycin may increase the serum concentration of Protease Inhibitors. *Risk D: Consider therapy modification*

Corticosteroids (Orally Inhaled): Protease Inhibitors may decrease the metabolism of Corticosteroids (Orally Inhaled). **Exceptions:** Beclomethasone; Flunisolide; Triamcinolone. *Risk D: Consider therapy modification*

CycloSPORINE: Protease Inhibitors may increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Protease Inhibitors. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inhibitors (Strong) may decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Delavirdine: Fosamprenavir may decrease the serum concentration of Delavirdine. The active metabolite amprenavir is likely responsible for this effect. Delavirdine may increase the serum concentration of Fosamprenavir. Specifically, delavirdine may increase concentrations of the active metabolite amprenavir. *Risk X: Avoid combination*

Digoxin: Protease Inhibitors may increase the serum concentration of Digoxin. Increased serum concentrations of digoxin may increase risk of AV nodal blockade. *Risk C: Monitor therapy*

Efavirenz: May increase the metabolism of Protease Inhibitors. This specifically includes amprenavir, indinavir, and saquinavir. Efavirenz may increase the serum concentration of Protease Inhibitors. This specifically includes nelfinavir and ritonavir. *Risk D: Consider therapy modification*

Enfuvirtide: Protease Inhibitors may increase the serum concentration of Enfuvirtide. Enfuvirtide may increase the serum concentration of Protease Inhibitors. *Risk C: Monitor therapy*

Eplerenone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Eplerenone. *Risk X: Avoid combination*

Eplerenone: Protease Inhibitors may decrease the metabolism of Eplerenone. *Risk C: Monitor therapy*

Ergot Derivatives: Protease Inhibitors may decrease the metabolism of Ergot Derivatives. **Exceptions:** Cabergoline. *Risk X: Avoid combination*

Etravirine: May increase the serum concentration of Fosamprenavir. *Risk X: Avoid combination*

FentaNYL: CYP3A4 Inhibitors (Strong) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

FentaNYL: Protease Inhibitors may decrease the metabolism of FentaNYL. *Risk C: Monitor therapy*

Fusidic Acid: Protease Inhibitors may decrease the metabolism of Fusidic Acid. Fusidic Acid may decrease the metabolism of Protease Inhibitors. *Risk D: Consider therapy modification*

Garlic: May decrease the serum concentration of Protease Inhibitors. *Risk C: Monitor therapy*

H2-Antagonists: May decrease the serum concentration of Fosamprenavir. Cimetidine may also inhibit the metabolism of the active metabolite amprenavir, making its effects on fosamprenavir/amprenavir concentrations difficult to predict. *Risk C: Monitor therapy*

HMG-CoA Reductase Inhibitors: Protease Inhibitors may increase the serum concentration of HMG-CoA Reductase Inhibitors. Limited data suggest pravastatin may slightly decrease protease inhibitor concentrations. Management: Lovastatin and simvastatin are contraindicated with many protease inhibitors; use lowest possible HMG-CoA reductase inhibitor dose and monitor for signs and symptoms of rhabdomyolysis if these agents are used concomitantly. **Exceptions:** Fluvastatin. *Risk D: Consider therapy modification*

Ixabepilone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ixabepilone. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Meperidine: Protease Inhibitors may enhance the adverse/toxic effect of Meperidine. Protease Inhibitors may decrease the serum concentration of Meperidine. Concentrations of the toxic Normeperidine metabolite may be increased. *Risk D: Consider therapy modification*

Methadone: Protease Inhibitors may decrease the metabolism of Methadone. *Risk C: Monitor therapy*

Nefazodone: Protease Inhibitors may decrease the metabolism of Nefazodone. *Risk C: Monitor therapy*

Nevirapine: May increase the metabolism of Protease Inhibitors. *Risk D: Consider therapy modification*

Nilotinib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nilotinib. *Risk X: Avoid combination*

Nisoldipine: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nisoldipine. *Risk X: Avoid combination*

Oral Contraceptive (Estrogens): May diminish the therapeutic effect of Protease Inhibitors. Protease Inhibitors may decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

PARoxetine: Fosamprenavir may decrease the serum concentration of PARoxetine. The active metabolite amprenavir is likely responsible for this effect. *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phenytoin: Fosamprenavir may decrease the serum concentration of Phenytoin. The active amprenavir metabolite is likely responsible for this effect. Phenytoin may increase the serum concentration of Fosamprenavir. Specifically, phenytoin may increase the concentration of the active metabolite amprenavir. *Risk C: Monitor therapy*

Phosphodiesterase 5 Inhibitors: Protease Inhibitors may decrease the metabolism of Phosphodiesterase 5 Inhibitors. Management: Dose restrictions for tadalafil, and/or sildenafil and vardenafil are recommended in combination with ritonavir, atazanavir, indinavir, darunavir and saquinavir. Consult specific prescribing information for detailed recommendations. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Strong) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Pimozide: Protease Inhibitors may decrease the metabolism of Pimozide. *Risk X: Avoid combination*

Protease Inhibitors: May increase the serum concentration of other Protease Inhibitors. Management: Atazanavir--indinavir combination contraindicated. Amprenavir oral solution not recommended with ritonavir oral solution; tipranavir/ritonavir or atazanavir/ritonavir not recommended with other protease inhibitors. Other combos may require dose changes. *Risk D: Consider therapy modification*

QuiNIDine: Protease Inhibitors may decrease the metabolism of QuiNIDine. *Risk X: Avoid combination*

Ranolazine: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ranolazine. *Risk X: Avoid combination*

Rifamycin Derivatives: Protease Inhibitors may decrease the metabolism of Rifamycin Derivatives. Specifically rifabutin. Rifamycin Derivatives may decrease the serum concentration of Protease Inhibitors. Rifampin administration should be avoided. Dosage adjustments with both rifabutin and the protease inhibitors are necessary if used together. Management: Avoid using rifampin with protease inhibitors. Rifabutin and protease inhibitor dose adjustments will likely be required when using rifabutin together with protease inhibitors; consult specific protease inhibitor(s) prescribing information. *Risk D: Consider therapy modification*

Rivaroxaban: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Salmeterol: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Salmeterol. *Risk X: Avoid combination*

Sirolimus: Protease Inhibitors may increase the serum concentration of Sirolimus. *Risk C: Monitor therapy*

Sorafenib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Sorafenib. *Risk C: Monitor therapy*

St Johns Wort: May increase the metabolism of Protease Inhibitors. *Risk X: Avoid combination*

Tacrolimus: Protease Inhibitors may decrease the metabolism of Tacrolimus. *Risk D: Consider therapy modification*

Temsirolimus: Protease Inhibitors may enhance the adverse/toxic effect of Temsirolimus. Levels of sirolimus, the active metabolite, may be increased, likely due to inhibition of CYP-mediated metabolism. *Risk D: Consider therapy modification*

Tenofovir: May decrease the serum concentration of Protease Inhibitors. Protease Inhibitors may increase the serum concentration of Tenofovir. *Risk C: Monitor therapy*

TraZODone: Protease Inhibitors may increase the serum concentration of TraZODone. *Risk D: Consider therapy modification*

Tricyclic Antidepressants: Protease Inhibitors may increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Valproic Acid: Protease Inhibitors may decrease the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Zidovudine: Protease Inhibitors may decrease the serum concentration of Zidovudine. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Amprenavir serum concentration may be decreased by St John's wort; concurrent use contraindicated.

Monitoring ParametersMonitor viral load, CD4 count, triglycerides, cholesterol, glucose

Nursing: Physical Assessment/MonitoringAssess other pharmacological or herbal products patient may be taking for potential interactions or toxicity (multiple liver enzyme interactions may increase or decrease levels/effects drugs and increase potential for severe toxicity or loss of effectiveness); dosing adjustments may be necessary. A list of medications that should not be used is available in each bottle and patients should be provided with this information. Assess therapeutic response (CD4 count, hepatic function) and adverse reactions at regular intervals during therapy (eg, gastrointestinal disturbance [nausea, vomiting, diarrhea] that can lead to dehydration and weight loss, hyperlipidemia and redistribution of body fat, rash, CNS effects [malaise, insomnia, abnormal thinking], electrolyte imbalance). Caution patients to monitor glucose levels closely; protease inhibitors may cause hyperglycemia or new-onset diabetes. Teach patient proper use (eg, timing of multiple medications and drugs that should not be used concurrently), possible side effects/appropriate interventions (eg, glucose testing: protease inhibitors may cause hyperglycemia, exacerbation, or new-onset diabetes; use of nonhormonal contraceptives: protease inhibitors may decrease effectiveness of oral contraceptives), and adverse symptoms to report.

Monitoring: Lab TestsMonitor viral load, CD4 count, triglycerides, cholesterol, glucose

Patient EducationYou will be provided with a list of specific medications that should not be used during therapy; do not take any new prescription or OTC medications or herbal products during therapy - even if they are not on the list - without consulting prescriber. This is not a cure for HIV, nor has it been found to reduce transmission of HIV; use appropriate precautions to prevent spread to other persons. Take as directed: Adults take tablets with or without food, take suspension without food; children take suspension with food. Maintain adequate hydration (2-3 L/day of fluids unless instructed to restrict fluid intake). You may be susceptible to infection (avoid crowds and exposure to known infections and do not have any vaccinations without consulting prescriber). This medication will be prescribed with a combination of other medications; time these medications as directed by prescriber. You may be advised to check your glucose levels; this drug can cause hyperglycemia. Frequent blood tests may be required with prolonged therapy. May cause body changes due to redistribution of body fat, facial atrophy, or breast enlargement (normal effects of drug); headache, dizziness, or fatigue (use caution when driving or engaged in potentially hazardous tasks until response to drug is known); nausea or vomiting (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); diarrhea (buttermilk, boiled milk, or yogurt may help); back pain; or arthralgia (consult prescriber for approved analgesic). Inform prescriber immediately if you experience unusual skin rash or reaction. Report muscle numbness or tingling; unresolved persistent vomiting, diarrhea, or abdominal pain; respiratory difficulty or chest pain; change in color of stool or urine; or any persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber for appropriate contraceptives.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Tablet, as calcium:

Lexiva®: 700 mg [equivalent to amprenavir ~600 mg)

Telzir® [CAN]: 700 mg [not available in the U.S.]

Suspension, oral, as calcium:

Lexiva®: 50 mg/mL (225 mL) [equivalent to amprenavir ~43 mg/mL; contains propylene glycol; grape-bubblegum-peppermint flavored]

Telzir® [CAN]: 50 mg/mL (225 mL) [not available in the U.S.]

Generic AvailableNo
ManufacturerGlaxoSmithKline
Pricing: U.S. (www.drugstore.com)

Tablets (Lexiva)

700 mg (30): $358.90

Mechanism of ActionFosamprenavir is rapidly and almost completely converted to amprenavir by cellular phosphatases *in vivo*. Amprenavir binds to the active site of HIV protease activity and inhibits cleavage of viral polyprotein precursors (eg, Gag and Gag-Pol) into individual functional proteins found in infectious HIV. Inhibition prevents cleavage of these polyproteins, resulting in the formation of immature, noninfectious viral particles.
Pharmacodynamics/Kinetics

Absorption: 63%

Protein-binding: >90% (to alpha$_1$-acid glycoprotein)

Metabolism: Fosamprenavir is rapidly and almost completely converted to amprenavir by cellular phosphatases in gut epithelium; amprenavir is hepatically metabolized via CYP isoenzymes (primarily CYP3A4)

Bioavailability: Not established; food does not have a significant effect on absorption of tablets. Administration of oral suspension with food reduced C_{max} by 46% and AUC by 28%.

Half-life elimination: ~7.7 hours (amprenavir)

Time to peak, plasma: 1.5-4 hours (median: 2.5 hours)

Excretion: Feces (75% as metabolites, <1% as unchanged drug); urine (14% as metabolites, <1% as unchanged drug)

Related Information

- Management of Healthcare Worker Exposures to HBV, HCV, and HIV

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusFatigue is common; may cause depression
Mental Health: Effects on Psychiatric TreatmentContraindicated in patients receiving midazolam, pimozide, and triazolam; concurrent use with other benzodiazepines may produce additive effects. Oral solution contraindicated with disulfiram. Do not use fosamprenavir with St John's wort; may lead to loss of response. Rash is common; consider in differential in patients receiving lamotrigine. GI side effects are common; concurrent use with SSRIs may produce additive GI effects. May produce hypertriglyceridemia; monitor with atypical antipsychotics. May produce neutropenia; use caution with clozapine and carbamazepine. Effects of methadone may be diminished with maintenance therapy; consider an alternative antiretroviral. Amprenavir may increase serum concentration/toxicity of sildenafil, tricyclic antidepressants, and vardenafil.

Fosaprepitant

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Fosaprepitant may be confused with aprepitant, fosamprenavir

Emend® for injection (fosaprepitant) may be confused with Emend® (aprepitant) which is an oral capsule formulation.

Pronunciation(fos a PRE pi tant)

U.S. Brand NamesEmend® for Injection

Pharmacologic CategoryAntiemetic; Substance P/Neurokinin 1 Receptor antagonist

Use: Labeled IndicationsPrevention of acute and delayed nausea and vomiting associated with moderately- and highly-emetogenic chemotherapy (in combination with other antiemetics)

Dosing: AdultsPrevention of chemotherapy-induced nausea/vomiting: I.V.: 115 mg 30 minutes prior to chemotherapy on day 1 (followed by aprepitant 80 mg orally on days 2 and 3) in combination with other antiemetics

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Mild, moderate, or severe impairment: No adjustment required.

Dialysis-dependent end-stage renal disease (ESRD): No adjustment required.

Dosing: Hepatic Impairment

Child-Pugh class A and B: No adjustment required.

Child-Pugh class C: Has not been evaluated.

Administration: I.V.Infuse over 15 minutes

StorageStore intact vials at 2°C to 8°C (36°F to 46°F). Solutions diluted for infusion are stable for 24 hours at room temperature of ≤25°C (≤77°F).

ReconstitutionReconstitute with 5 mL of sodium chloride 0.9%, directing diluent down side of vial to avoid foaming. Add reconstituted contents of vial to 110 mL sodium chloride 0.9%, resulting in a final concentration of 1 mg/mL; gently invert bag to mix.

CompatibilityStable in sodium chloride 0.9%

Incompatible with solutions containing calcium (eg, lactated Ringer's solution, Hartmann's solution) or magnesium.

ContraindicationsHypersensitivity to fosaprepitant, aprepitant, polysorbate 80, or any component of the formulation; concurrent use with pimozide or cisapride

Warnings/Precautions

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; has not been studied in patients with severe hepatic impairment (Child-Pugh class C).
- Nausea/vomiting: Appropriate use: Not intended for treatment of existing nausea and vomiting or for chronic continuous therapy.

Concurrent drug therapy issues:

- High potential for interactions: Fosaprepitant is rapidly converted to aprepitant, which has a high potential for drug interactions. Use with caution in patients taking strong CYP3A4 inhibitors, moderate or strong CYP3A4 inducers and major CYP3A4 substrates (see Drug Interactions); consider alternative agents that avoid or lessen the potential for CYP-mediated interactions. The effect of aprepitant on orally-administered CYP3A4 substrates is greater than those administered intravenously. Aprepitant concentrations may be elevated with concomitant use of another strong CYP3A4 inhibitor.

Geriatric ConsiderationsPrior studies with aprepitant by the manufacturer were demonstrated in a total of 544 patients, 31% were >65 years of age, while 5% were >75 years. No differences in safety and efficacy were noted between elderly subjects and younger adults. No dosing adjustment is necessary.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women; use only if clearly needed.

LactationExcretion in breast milk unknown/not recommended

Adverse ReactionsAdverse reactions reported with aprepitant and fosaprepitant (as part of a combination chemotherapy regimen) occurring at a higher frequency than standard therapy:

>10%:

Central nervous system: Fatigue (≤18%)

Gastrointestinal: Nausea (≤13%)

Neuromuscular & skeletal: Weakness (≤18%)

Miscellaneous: Hiccups (11%)

1% to 10%:

Central nervous system: Dizziness (≤7%), headache (≤3%)

Endocrine & metabolic: Dehydration (6%), hot flushing (3%)

Gastrointestinal: Diarrhea (≤10%), dyspepsia (≤8%), abdominal pain (5%), stomatitis (≤5%), epigastric discomfort (4%), gastritis (4%), throat pain (≤3%)

Hematologic: Neutropenia (≤9%)

Hepatic: ALT increased (≤6%), AST increased (≤3%)

Local: Injection site pain (8%), injection site induration (2%)

Renal: BUN increased (≤5%), proteinuria (≤7%)

>0.5%: Acid reflux, acne, alkaline phosphatase increased, anemia, anxiety, appetite decreased, arthralgia, back pain, candidiasis, confusion, conjunctivitis, cough, depression, diabetes mellitus, diaphoresis, DVT, dysphagia, dyspnea, dysuria, edema, eructation, erythrocyturia, flatulence, herpes simplex, hyper-/hypotension, hypokalemia, hyponatremia, leukocytes increased, leukocyturia, malaise, MI, muscle weakness, musculoskeletal pain, myalgia, nasal secretion, obstipation, palpitation, pelvic pain, peripheral neuropathy, pharyngitis, pneumonitis, pulmonary embolism, rash, renal insufficiency, respiratory infection, respiratory insufficiency, rigors, salivation increased, sensory neuropathy, septic shock, swallowing disorder, tachycardia, taste disturbance, tremor, urinary tract infection, vocal disturbance, weight loss, xerostomia

Postmarketing and/or case reports (with fosaprepitant or aprepitant): Albumin decreased, angioedema, bilirubin increased, bradycardia, disorientation, duodenal ulcer (perforating), dysarthria, enterocolitis, fever, glycosuria, hematoma, hyperglycemia, hypoesthesia, hypothermia, hypovolemia, hypoxia, miosis, neutropenic sepsis, pneumonia, pruritus, sensory disturbance, sinus tachycardia, Stevens-Johnson syndrome, subileus, syncope, urticaria, visual acuity decreased, wheezing

Metabolism/Transport Effects **Substrate** of CYP1A2 (minor), 2C19 (minor), 3A4 (major); **Inhibits** CYP2C9 (weak), 2C19 (weak), 3A4 (moderate); **Induces** CYP2C9 (weak), 3A4 (weak)

Drug Interactions

Antifungal Agents (Azole Derivatives, Systemic): May increase the serum concentration of Fosaprepitant. Specifically, concentrations of aprepitant are likely to be increased. *Risk C: Monitor therapy*

Benzodiazepines (metabolized by oxidation): Fosaprepitant may increase the serum concentration of Benzodiazepines (metabolized by oxidation). Specifically, the active metabolite aprepitant is likely responsible for this effect. *Risk C: Monitor therapy*

Cisapride: Fosaprepitant may increase the serum concentration of Cisapride. The active metabolite aprepitant is likely responsible for this effect. *Risk X: Avoid combination*

Contraceptive (Progestins): Fosaprepitant may decrease the serum concentration of Contraceptive (Progestins). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Fosaprepitant may increase the serum concentration of Corticosteroids (Systemic). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Diltiazem: Fosaprepitant may increase the serum concentration of Diltiazem. The active metabolite aprepitant is likely responsible for this effect. Diltiazem may increase the serum concentration of Fosaprepitant. Specifically, diltiazem may increase the concentration of the active metabolite aprepitant. *Risk C: Monitor therapy*

Eplerenone: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Eplerenone. Management: A lower starting dose of eplerenone (25 mg once daily) is recommended in patients with hypertension who are also taking drugs that are moderate inhibitors of CYP3A4. *Risk D: Consider therapy modification*

FentaNYL: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Oral Contraceptive (Estrogens): Fosaprepitant may decrease the serum concentration of Oral Contraceptive (Estrogens). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Pimozide: Fosaprepitant may increase the serum concentration of Pimozide. The active metabolite aprepitant is likely responsible for this effect. *Risk X: Avoid combination*

Ranolazine: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Ranolazine. Management: Limit the ranolazine dose to a maximum of 500mg twice daily in patients concurrently receiving moderate CYP3A4 inhibitors (e.g., diltiazem, verapamil, erythromycin, etc.). *Risk D: Consider therapy modification*

Rifampin: May decrease the serum concentration of Fosaprepitant. More specifically, rifampin may decrease concentrations of the active metabolite aprepitant. *Risk C: Monitor therapy*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Warfarin: Fosaprepitant may decrease the serum concentration of Warfarin. The active metabolite aprepitant is likely responsible for this effect. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Aprepitant serum concentration may be increased when taken with grapefruit juice; avoid concurrent use.

Herb/Nutraceutical: Avoid St John's wort (may decrease aprepitant levels).

Nursing: Physical Assessment/MonitoringSee Aprepitant for Assessment/Monitoring and Patient Education. I.V.: See Administration specifics.

Patient EducationSee Aprepitant for Assessment/Monitoring and Patient Education.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Emend® for Injection: 115 mg [contains edetate disodium; lactose; polysorbate 80]

Generic AvailableNo

ManufacturerMerck and Co, Inc

Pricing: U.S. (www.drugstore.com)

Solution (reconstituted) (Emend)

115 mg (1): $195.98

Mechanism of ActionFosaprepitant is a prodrug of aprepitant, which prevents acute and delayed vomiting by inhibiting the substance P/neurokinin 1 (NK1) receptor; augments the antiemetic activity of the 5-HT$_3$ receptor antagonist and corticosteroid activity and inhibits chemotherapy-induced emesis.

Pharmacodynamics/Kinetics

Distribution: Fosaprepitant: ~5 L; Aprepitant: V$_d$: ~70 L; crosses the blood brain barrier

Protein binding: Aprepitant: >95%

Metabolism:

Fosaprepitant: Hepatic and extrahepatic; rapidly converted to aprepitant (nearly complete conversion)

Aprepitant: Hepatic via CYP3A4 (major); CYP1A2 and CYP2C19 (minor); forms 7 weakly-active metabolites

Bioavailability: Fosaprepitant 115 mg I.V. is bioequivalent to aprepitant 125 mg orally.

Half-life elimination: Half-life elimination: Fosaprepitant: ~2 minutes; Aprepitant: ~9-13 hours

Time to peak, plasma: Fosaprepitant is converted to aprepitant within 30 minutes after the end of infusion

Excretion: Urine (57%); feces (45%)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Stomatitis, taste disturbances, xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusFatigue is common; may cause dizziness

Mental Health: Effects on Psychiatric TreatmentConcurrent use with pimozide is contraindicated; avoid combination. GI side effects are common; concurrent use with SSRIs, carbamazepine, lithium, and valproic acid may produce additive effects. May produce neutropenia; use caution with clozapine and carbamazepine. A potential for numerous drug-drug interactions exists. Aprepitant may increase the serum concentration of benzodiazepines including alprazolam, chlordiazepoxide, clonazepam, clorazepate, diazepam, estazolam, flurazepam, midazolam, quazepam, and triazolam (metabolized by oxidation). CYP3A4 inducers (eg, carbamazepine, phenobarbital, and phenytoin) may decrease levels/effects of aprepitant. CYP3A4 inhibitors (eg, nefazodone and verapamil) may increase levels/effects of aprepitant. Aprepitant may increase the levels/effects of CYP3A4 substrates (eg, benzodiazepines, calcium channel blockers, ergot derivatives, mirtazapine, nefazodone, and venlafaxine. Avoid St John's wort (may decrease aprepitant levels).

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(fos KAR net)

U.S. Brand NamesFoscavir®

Canadian Brand NamesFoscavir®

Pharmacologic CategoryAntiviral Agent

Use: Labeled IndicationsTreatment of acyclovir-resistant mucocutaneous herpes simplex virus (HSV) infections in immunocompromised persons (eg, with advanced AIDS); treatment of CMV retinitis in persons with HIV

Use: Unlabeled/InvestigationalOther CMV infections (eg, colitis, esophagitis, neurological disease); CMV prophylaxis for cancer patients receiving alemtuzumab therapy or allogeneic stem cell transplant

Use: DentalTreatment of acyclovir-resistant mucocutaneous herpes simplex virus (HSV) infections in immunocompromised persons (eg, with advanced AIDS); treatment of CMV retinitis in persons with HIV

Dosing: Adults

CMV retinitis: I.V.:

Induction treatment: 60 mg/kg/dose every 8 hours for 14-21 days **or** 90 mg/kg every 12 hours for 14-21 days

Maintenance therapy: 90-120 mg/kg/day as a single daily infusion

Acyclovir-resistant HSV induction treatment: I.V.: 40 mg/kg/dose every 8-12 hours for 14-21 days

Therapy of CMV infection in cancer patients (unlabeled use): I.V.:

Prophylaxis: 60 mg/kg every 8-12 hours for 7 days, followed by 90-120 mg/kg daily until day 100 after HSCT

Pre-emptive treatment: 60 mg/kg every 12 hours for 14 days; if CMV still detectable, continue with 90 mg/kg daily for 5 days/week for 2 additional weeks

Treatment: 90 mg/kg every 12 hours for 2 weeks, followed by 120 mg/kg daily for ≥2 weeks

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricAdolescents: Refer to adult dosing.

Dosing: Renal ImpairmentSee tables.

Induction Dosing of Foscarnet in Patients With Abnormal Renal Function

Cl_{cr} (mL/min/kg)	**HSV**	**HSV**	**CMV**	**CMV**

>0.8-1.0	50 mg/kg every 24 hours	65 mg/kg every 24 hours
>1.0-1.4	70 mg/kg every 24 hours	90 mg/kg every 24 hours
>1.4	90 mg/kg every 24 hours	120 mg/kg every 24 hours

Hemodialysis:

Foscarnet is highly removed by hemodialysis (up to ~38% in 2.5 hours HD with high-flux membrane)

Doses of 50 mg/kg/dose posthemodialysis have been found to produce similar serum concentrations as doses of 90 mg/kg twice daily in patients with normal renal function

Doses of 60-90 mg/kg/dose loading dose (posthemodialysis) followed by 45-60 mg/kg/dose posthemodialysis (3 times/week) with the monitoring of weekly plasma concentrations to maintain peak plasma concentrations in the range of 400-800 µMolar have been recommended by some clinicians

Continuous arteriovenous or venovenous hemodiafiltration effects: Dose as for Cl_{cr} 10-50 mL/minute

Administration: I.V.Use an infusion pump, at a rate not exceeding 1 mg/kg/minute. Adult induction doses of 60 mg/kg are administered over 1 hour. Adult maintenance doses of 90-120 mg/kg are infused over 2 hours. The manufacturer recommends 750-1000 mL of NS or D_5W be administered prior to first infusion to establish diuresis. With subsequent infusions of 90-120 mg/kg, this volume would be repeated. If the dose were 40-60 mg/kg, then the volume could be reduced to 500 mL. After the first dose, the hydration fluid should be administered concurrently with foscarnet.

Administration: I.V. DetailUndiluted (24 mg/mL) solution can be administered without further dilution when using a central venous catheter for infusion. For peripheral vein administration, the solution **must** be diluted to a final concentration **not to exceed** 12 mg/mL. The recommended dosage, frequency, and rate of infusion should not be exceeded.

pH: 7.4 (adjusted)

StorageFoscarnet injection is a clear, colorless solution. Store intact bottles at room temperature of 15°C to 30°C (59°F to 86°F) and protect from temperatures >40°C and from freezing. Diluted solution is stable for 24 hours at room temperature or under refrigeration.

ReconstitutionFoscarnet should be diluted in D_5W or NS. For peripheral line administration, foscarnet **must** be diluted to ≤12 mg/mL with D_5W or NS. For central line administration, foscarnet may be administered undiluted.

CompatibilityStable in D_5W, NS; **incompatible** with dextrose 30%, LR, TPN, and I.V. solutions containing calcium, magnesium, vancomycin.

Y-site administration: Compatible: Aldesleukin, amikacin, aminophylline, ampicillin, aztreonam, cefazolin, cefoperazone, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, cimetidine, clindamycin, dexamethasone sodium phosphate, dopamine, erythromycin lactobionate, fluconazole, flucytosine, furosemide, gentamicin, heparin, hydrocortisone sodium succinate, hydromorphone, hydroxyzine, imipenem/cilastatin, metoclopramide, metronidazole, morphine, nafcillin, oxacillin, penicillin G potassium, phenytoin, piperacillin, ranitidine, ticarcillin/clavulanate, tobramycin. **Incompatible:** Acyclovir, amphotericin B, diazepam, digoxin, diphenhydramine, dobutamine, droperidol, ganciclovir, haloperidol, leucovorin, midazolam, pentamidine, prochlorperazine edisylate, promethazine. **Variable (consult detailed reference):** Co-trimoxazole, lorazepam, vancomycin.

Compatibility when admixed: Compatible: Potassium chloride.

ContraindicationsHypersensitivity to foscarnet or any component of the formulation

Warnings/Precautions

Boxed warnings:

- Approved indications: See “Other warnings/precautions” below.
- Renal impairment: See “Concerns related to adverse effects” below.

- Seizures: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Dental effects: Foscarnet is deposited in teeth and bone of young, growing animals; it has adversely affected tooth enamel development in rats.

- Electrolyte imbalance: Imbalance of serum electrolytes or minerals occurs in at least 15% of patients (hypocalcemia, low ionized calcium, hyper/hypophosphatemia, hypomagnesemia, or hypokalemia); reducing infusion rate may decrease/prevent symptoms. Patients with low ionized calcium may experience perioral tingling, numbness, paresthesias, tetany, and seizures. Correct electrolytes before initiating therapy; use caution in patients who have any underlying electrolyte imbalances, those with neurologic or cardiac abnormalities, and those receiving medications that are influenced by calcium levels. Use caution when administering other medications that cause electrolyte imbalances. Patients who experience signs or symptoms of an electrolyte imbalance should be assessed immediately.

- Hematologic effects: May cause anemia and granulocytopenia.

- Renal impairment: **[U.S. Boxed Warning]: Renal impairment occurs to some degree in the majority of patients treated with foscarnet;** renal impairment may occur at any time (though typically during second week of induction therapy) and is usually reversible within 1 week following dose adjustment or discontinuation of therapy, however, several patients have died with renal failure within 4 weeks of stopping foscarnet; therefore, renal function should be closely monitored during both induction and maintenance therapy. To reduce the risk of nephrotoxicity and the potential to administer a relative overdose, always calculate the Cl_{cr} even if serum creatinine is within the normal range. Dosage adjustments are recommended for renal dysfunction; safety and efficacy in patients with a baseline S_{cr} >2.8 mg/dL or Cl_{cr} <50 mL/minute are limited. Use in patients with Cl_{cr} <0.4 mL/kg/minute is not recommended. Adequate hydration may reduce the risk of nephrotoxicity; the manufacturer makes specific recommendations regarding this (see Administration).

- Seizures: **[U.S. Boxed Warning]: Seizures related to plasma electrolyte/mineral imbalance may occur;** incidence has been reported in up to 10% of HIV patients. Risk factors for seizures include impaired baseline renal function, low total serum calcium, and underlying CNS condition. Some patients who have experienced seizures have been able to continue or resume foscarnet treatment after their mineral or electrolyte abnormality has been corrected, their underlying disease state treated, or their dose decreased.

- Vascular irritant: Administer only into vein with adequate blood flow to prevent tissue irritation/ulceration. Genital vascular tissue damage has been reported; adequate hydration recommended.

Other warnings/precautions:

- Approved indications: **[U.S. Boxed Warning]: Indicated only for immunocompromised patients with CMV retinitis and mucocutaneous acyclovir-resistant HSV infection.**

Geriatric ConsiderationsInformation on the use of foscarnet is lacking in the elderly. Dose adjustments and proper monitoring must be performed because of the decreased renal function common in older patients.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAssociated with an increase in skeletal anomalies in animal studies at approximately the equivalent of 13% to 33% of the maximal daily human dose. There are no adequate and well controlled studies in pregnant women. A single case report of use during the third trimester with normal infant outcome was observed. Monitoring of amniotic fluid volumes by ultrasound is recommended weekly after 20 weeks of gestation to detect oligohydramnios.

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsThe CDC recommends **not** to breast-feed if diagnosed with HIV to avoid postnatal transmission of the virus.

Adverse Reactions

>10%:

Central nervous system: Fever (65%), headache (26%)

Endocrine & metabolic: Hypokalemia (16% to 48%), hypocalcemia (15% to 30%), hypomagnesemia (15% to 30%), hypophosphatemia (8% to 26%)

Gastrointestinal: Nausea (47%), diarrhea (30%), vomiting (26%)

Hematologic: Anemia (33%), granulocytopenia (17%)

Renal: Abnormal renal function/decreased creatinine clearance (12%; without adequate hydration 33%)

1% to 10%:

Cardiovascular: Chest pain (1% to 5%), edema (1% to 5%), facial edema (1% to 5%), flushing (1% to 5%), hyper-/hypotension (1% to 5%), palpitation (1% to 5%), ECG changes (1% to 5%)

Central nervous system: Seizure (includes grand mal; 8%), anxiety (≥5%), confusion (≥5%), depression (≥5%), dizziness (≥5%), fatigue (≥5%), hypoesthesia (≥5%), malaise (≥5%), pain (≥5%), aggressiveness (1% to 5%), agitation (1% to 5%), amnesia (1% to 5%), aphasia (1% to 5%), ataxia (1% to 5%), coordination abnormal (1% to 5%), dementia (1% to 5%), EEG abnormal (1% to 5%), hallucination (1% to 5%), insomnia (1% to 5%), meningitis (1% to 5%), nervousness (1% to 5%), somnolence (1% to 5%), stupor (1% to 5%)

Dermatologic: Rash (≥5%), erythematous rash (1% to 5%), maculopapular rash (1% to 5%), pruritus (1% to 5%), seborrhea (1% to 5%), skin discoloration (1% to 5%), skin ulceration (1% to 5%)

Endocrine & metabolic: Hyperphosphatemia (6%), acidosis (1% to 5%), hyponatremia (1% to 5%)

Gastrointestinal: Abdominal pain (≥5%), anorexia (≥5%), constipation (1% to 5%), dyspepsia (1% to 5%), dysphasia (1% to 5%), flatulence (1% to 5%), melena (1% to 5%), pancreatitis (1% to 5%), rectal hemorrhage (1% to 5%), taste perversion (1% to 5%), ulcerative stomatitis (1% to 5%), weight loss (1% to 5%), xerostomia (1% to 5%)

Genitourinary: Dysuria (1% to 5%), nocturia (1% to 5%), urinary retention (1% to 5%)

Hematologic: Leukopenia (≥5%), lymphadenopathy (1% to 5%), thrombocytopenia (1% to 5%), thrombosis (1% to 5%)

Hepatic: Alkaline phosphatase increased (1% to 5%), ALT increased (1% to 5%), AST increased (1% to 5%), hepatic function abnormal (1% to 5%), LDH increased (1% to 5%)

Local: Injection site pain/inflammation (1% to 5%)

Neuromuscular & skeletal: Paresthesia (≥5%), involuntary muscle contractions (≥5%), rigors (≥5%), neuropathy (peripheral; ≥5%), weakness (≥5%), arthralgia (1% to 5%), back pain (1% to 5%), leg cramps (1% to 5%), myalgia (1% to 5%), tremor (1% to 5%)

Ocular: Vision abnormalities (≥5%), conjunctivitis (1% to 5%), eye pain (1% to 5%)

Renal: Acute renal failure (1% to 5%), albuminuria (1% to 5%), BUN increased (1% to 5%), polyuria (1% to 5%), urinary tract infection (1% to 5%)

Respiratory: Cough (≥5%), dyspnea (≥5%), bronchospasm (1% to 5%), hemoptysis (1% to 5%), pharyngitis (1% to 5%), pneumonia (1% to 5%), pneumothorax (1% to 5%), rhinitis (1% to 5%), sinusitis (1% to 5%), stridor (1% to 5%)

Miscellaneous: Diaphoresis (≥5%), sepsis (≥5%), infection (includes bacterial and fungal; ≥5%), flu-like syndrome (1% to 5%), malignancies (lymphoma/sarcoma 1% to 5%), thirst (1% to 5%)

<1%, postmarketing, and/or case reports: Amylase increased, cardiac arrest, coma, creatinine phosphokinase increased, dehydration, diabetes insipidus (usually nephrogenic), erythema multiforme, GGT increased muscle weakness, hematuria, hypoproteinemia, myopathy, myositis, neutropenia, pancytopenia, QT_c prolongation, renal calculus, rhabdomyolysis, Stevens-Johnson syndrome, syndrome of inappropriate antidiuretic hormone (SIADH), toxic epidermal necrolysis, ventricular arrhythmia, vesiculobullous eruptions

Oncology: VesicantNo
Oncology: Emetic PotentialModerate (30% to 60%)
Drug Interactions

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Monitoring Parameters24-hour creatinine clearance at baseline and periodically thereafter. During induction therapy: Obtain complete blood counts, and electrolytes (including serum creatinine, calcium, magnesium, potassium and phosphorus) twice weekly and then one weekly during maintenance therapy. More frequent monitoring may be required in some patients. Check hydration status before and after infusion.
Nursing: Physical Assessment/MonitoringEvaluate electrolytes, renal status, and dental status prior to beginning therapy. Assess potential for interactions with other pharmacological agents patient may be taking (eg, increased risk of seizures, renal failure, electrolyte imbalance). See Administration for infusion specifics. Assess results of laboratory tests (electrolytes) and renal function, therapeutic effectiveness (resolution of viral infection), and adverse response (eg, nephrotoxicity, electrolyte imbalance, seizures). Teach patient possible side effects/appropriate interventions (eg, need for regular dental evaluations) and adverse symptoms to report.
Monitoring: Lab TestsRenal function, CBC, electrolytes, calcium, magnesium
Patient EducationDo not take any new medication during therapy unless approved by prescriber. Foscarnet is not a cure for the disease; progression may occur during or following therapy. While on therapy, it is important to maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake, and nutrition (small, frequent meals may help). Regular dental check-ups are recommended. May cause dizziness or confusion (use caution when driving or engaging in tasks that require alertness until response to drug is known); nausea and vomiting (small, frequent meals, frequent mouth care, chewing gum or sucking lozenges may help); or diarrhea (buttermilk, boiled milk, or yogurt may help). Report any change in sensorium or seizures; unresolved diarrhea or vomiting; unusual fever, chills, sore throat, unhealed sores, swollen lymph glands; or malaise. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Barrier contraceptives are recommended to reduce transmission of disease. Do not breast-feed.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as sodium [preservative-free]: 24 mg/mL (250 mL, 500 mL)

Foscavir®: 24 mg/mL (500 mL)

Generic AvailableYes
ManufacturerAstraZeneca Pharmaceuticals LP
Mechanism of ActionPyrophosphate analogue which acts as a noncompetitive inhibitor of many viral RNA and DNA polymerases as well as HIV reverse transcriptase. Similar to ganciclovir, foscarnet is a virostatic agent. Foscarnet does not require activation by thymidine kinase.

Pharmacodynamics/Kinetics

Distribution: V_d: ~0.5 L/kg; up to 28% of cumulative I.V. dose may be deposited in bone

Protein binding: 14% to 17%

Metabolism: Biotransformation does not occur

Half-life elimination: Elimination: ~3-4 hours; terminal: ~88 hours (due to bone deposition)

Excretion: Urine (≤28% as unchanged drug)

Pharmacotherapy PearlsCMV retinitis maintenance treatment may be discontinued if immune reconstitution occurs as a result of ART.

Dental Health Professional Considerations Foscarnet is known to prolong the QT interval. The QT interval is measured as the time and distance between the Q point of the QRS complex and the end of the T wave in the ECG tracing. After adjustment for heart rate, the QT interval is defined as prolonged if it is more than 450 msec in men and 460 msec in women. A long QT syndrome was first described in the 1950s and 60s as a congenital syndrome involving QT interval prolongation and syncope and sudden death. Some of the congenital long QT syndromes were characterized by a peculiar electrocardiographic appearance of the QRS complex involving a premature atria beat followed by a pause, then a subsequent sinus beat showing marked QT prolongation and deformity. This type of cardiac arrhythmia was originally termed “torsade de pointes” (translated from the French as “twisting of the points”).

Prolongation of the QT interval is thought to result from delayed ventricular repolarization. The repolarization process within the myocardial cell is due to the efflux of intracellular potassium. The channels associated with this current can be blocked by many drugs and predispose the electrical propagation cycle to torsade de pointes.

Foscarnet is considered as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. It is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution.

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation), taste perversion, and ulcerative stomatitis.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions Foscarnet is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution. See Dental Comment.

Mental Health: Effects on Mental Status Dizziness, anxiety, confusion, and depression are common; may rarely produce abnormal crying

Mental Health: Effects on Psychiatric Treatment Leukopenia is common; use caution with clozapine and carbamazepine

Index TermsPFA; Phosphonoformate; Phosphonoformic Acid

Medication Safety Issues

Sound-alike/look-alike issues:

Monurol® may be confused with Monopril®

Pronunciation(fos foe MYE sin)

U.S. Brand NamesMonurol®

Canadian Brand NamesMonurol®

Pharmacologic CategoryAntibiotic, Miscellaneous

Use: Labeled IndicationsSingle oral dose in the treatment of uncomplicated urinary tract infections in women due to susceptible strains of *E. coli* and *Enterococcus faecalis*

Use: Unlabeled/InvestigationalMultiple doses have been investigated for complicated urinary tract infections in men

Dosing: Adults

Urinary tract infections, uncomplicated: Oral: Females: Single dose of 3 g in 3-4 oz (90-120 mL) of water

Complicated UTI (unlabeled): Males: Oral: 3 g every 2-3 days for 3 doses

Prostatitis (unlabeled): Males: Oral: 3 g every 3 days for a total of 21 days

Dosing: ElderlyRefer to adult dosing.

Dosing: Hepatic ImpairmentNo dosage decrease needed.

Administration: OralAlways mix with cool water before ingesting; do not administer in its dry form. Pour contents of envelope into 3-4 oz (90-120 mL) of water (not hot), stir to dissolve, and take immediately.

Dietary ConsiderationsMay be taken with or without food.

StorageStore at controlled room temperature of 25°C (77°F).

ContraindicationsHypersensitivity to fosfomycin or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children ≤12 years of age.

Pregnancy Risk FactorB

Pregnancy ConsiderationsFollowing I.M. administration to animals at doses 9 times the human dose, fosfomycin crossed the placental barrier, but did not produce teratogenic effects. Some fetotoxicities were observed in rabbits; however, these toxicities were considered to be due to the changes in intestinal microflora. There are no adequate and well-controlled studies in pregnant women.

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

1% to 10%:

Central nervous system: Headache (4% to 10%), pain (2%), dizziness (1% to 2%)

Dermatologic: Rash (1%)

Endocrine and metabolic: Dysmenorrhea (3%)

Gastrointestinal: Diarrhea (9% to 10%), nausea (4% to 5%), abdominal pain (2%), dyspepsia (1% to 2%)

Genitourinary: Vaginitis (6% to 8%)

Neuromuscular & skeletal: Back pain (3%), weakness (1% to 2%)

Respiratory: Rhinitis (5%), pharyngitis (3%)

<1%: Anorexia, constipation, drowsiness, dysuria, ear disorder, fatigue, fever, flatulence, flu-like syndrome, hematuria, insomnia, lymphadenopathy, menstrual disorder, migraine, myalgia, nervousness, paresthesia, pruritus, SGPT increased, skin disorder, somnolence, stools abnormal, vomiting, xerostomia

Postmarketing and/or case reports: Anaphylaxis, angioedema, aplastic anemia, asthma (exacerbation), cholestatic jaundice, hearing loss, hepatic necrosis, optic neuritis, toxic megacolon

Drug Interactions

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Monitoring ParametersSigns and symptoms of urinary tract infection; urine culture plus sensitivity

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Powder for solution:

Monurol®: 3 g/sachet (3s) [orange flavor]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Pack (Monurol)

3 g (1): $44.99

Mechanism of ActionAs a phosphoric acid derivative, fosfomycin inhibits bacterial wall synthesis (bactericidal) by inactivating the enzyme, pyruvyl transferase, which is critical in the synthesis of cell walls by bacteria

Pharmacodynamics/Kinetics

Absorption: Well absorbed

Distribution: V_d: 90-180 L; high concentrations in urine; well into other tissues; crosses maximally into CSF with inflamed meninges

Protein binding: None

Bioavailability: Fasting: 37%; With food: 30%

Half-life elimination: 4-8 hours; Cl_{cr} <54 mL/minute: 50 hours

Time to peak, serum: 2 hours; within 4 hours with high-fat meal

Excretion: Urine (38% as unchanged drug); high urinary levels (100 mcg/mL) persist for >48 hours; feces (18% as unchanged drug)

Related Information

- Antimicrobial Drugs of Choice

Pharmacotherapy Pearls

May have an advantage over other agents since it maintains high concentration in the urine for up to 48 hours.

Many gram-positive and gram-negative organisms, such as staphylococci, pneumococci, *E. coli*, *Salmonella*, *Shigella*, *H. influenzae*, *Neisseria* spp, and some strains of *P. aeruginosa*, indole-negative *Proteus*, and *Providencia*, are inhibited. *B. fragilis* and anaerobic gram-negative cocci are resistant.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness

Mental Health: Effects on Psychiatric TreatmentNone reported

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Monopril® may be confused with Accupril®, minoxidil, moexipril, Monoket®, Monurol™, ramipril

Pronunciation(foe SIN oh pril & hye droe klor oh THYE a zide)

U.S. Brand NamesMonopril-HCT®

Canadian Brand NamesMonopril-HCT®

Pharmacologic CategoryAngiotensin-Converting Enzyme (ACE) Inhibitor; Diuretic, Thiazide

Use: Labeled IndicationsTreatment of hypertension; not indicated for first-line treatment

Dosing: AdultsHypertension: Oral: Fosinopril 10-80 mg per day, hydrochlorothiazide 12.5-50 mg per day

Note: A patient whose blood pressure is not adequately controlled with fosinopril or hydrochlorothiazide monotherapy may be switched to combination therapy.

Dosing: ElderlyNo dosage adjustment needed

Dosing: PediatricSafety and efficacy have not been established in pediatric patients

Dosing: Renal Impairment

Cl_{cr} ≥30 mL/minute: No dosage adjustment needed

Cl_{cr} <30 mL/minute or serum creatinine ≥3 mg/dL: Use is not recommended

Dosing: Hepatic ImpairmentUse caution in patients with impaired hepatic function from progressive liver disease. Metabolism of fosinopril to its active metabolite, fosinoprilat, will be reduced as will clearance of fosinoprilat.

Calculations

- Creatinine Clearance: Adults

StorageStore at 15°C to 30°C (59°F to 86°F). Protect from moisture.

ContraindicationsHypersensitivity to fosinopril, any other ACE inhibitor, hydrochlorothiazide, sulfonamide-derived drugs, or any component of the formulation; anuria

Allergy Considerations

- ACE Inhibitor Allergy/Hypersensitivity
- Thiazide/Thiazide-Related Diuretic Allergy

Warnings/Precautions

Boxed warnings:

- Pregnancy: See "Special populations" below.

Concerns related to adverse effects:

- Angioedema: At any time during treatment (especially following first dose), angioedema may occur rarely with ACE inhibitors; it may involve the head and neck (potentially compromising airway) or the intestine (presenting with abdominal pain). African-Americans and patients with idiopathic or hereditary angioedema or previous angioedema associated with ACE inhibitor therapy may be at an increased risk. Prolonged frequent monitoring may be required especially if tongue, glottis, or larynx are involved as they are associated with airway obstruction. Patients with a history of airway surgery may have a higher risk of airway obstruction. Aggressive early and appropriate management is critical.

- Cholestatic jaundice: A rare toxicity associated with ACE inhibitors includes cholestatic jaundice, which may progress to fulminant hepatic necrosis; discontinue if marked elevation of hepatic transaminases or jaundice occurs.

- Cough: An ACE inhibitor cough is a dry, hacking, nonproductive one that usually occurs within the first few months of treatment and should generally resolve within 1-4 weeks after discontinuation of the ACE inhibitor. Other causes of cough should be considered (eg, pulmonary congestion in patients with heart failure) and excluded prior to discontinuation.

- Electrolyte disturbances: Hyperkalemia may occur with ACE inhibitors; risk factors include renal dysfunction, diabetes mellitus, and concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salts. Use cautiously, if at all, with these agents and monitor potassium closely. Thiazide diuretics may cause hypokalemia, hypochloremic alkalosis, hypomagnesemia, and hyponatremia.

- Hypersensitivity reactions: Anaphylactic/anaphylactoid reactions can occur with ACE inhibitors. Severe anaphylactoid reactions may be seen during hemodialysis (eg, CVVHD) with high-flux dialysis membranes (eg, AN69), and rarely, during low density lipoprotein apheresis with dextran sulfate cellulose. Rare cases of anaphylactoid reactions have been reported in patients undergoing sensitization treatment with hymenoptera (bee, wasp) venom while receiving ACE inhibitors.

- Hypotension/syncope: Symptomatic hypotension with or without syncope can occur with ACE inhibitors (usually with the first several doses); effects are most often observed in volume-depleted patients; correct volume depletion prior to initiation; close monitoring of patient is required especially with initial dosing and dosing increases; blood pressure must be lowered at a rate appropriate for the patient's clinical condition. Although dose reduction may be necessary, hypotension is not a reason for discontinuation of future ACE inhibitor use especially in patients with heart failure where a reduction in systolic blood pressure is a desirable observation.

- Neutropenia/agranulocytosis: Another ACE Inhibitor, captopril, has been associated with rare cases of agranulocytosis, neutropenia, or leukopenia with myeloid hypoplasia. Patients with renal impairment are at high risk of developing neutropenia. Patients with both renal impairment and collagen vascular disease (eg, systemic lupus erythematosus) are at an even higher risk of developing neutropenia. Periodically monitor CBC with differential in these patients.

- Photosensitivity: Photosensitization may occur.

- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.

Disease-related concerns:

- Aortic stenosis: Use with caution in patients with severe aortic stenosis; may reduce coronary perfusion resulting in ischemia.

- Cardiovascular disease: Initiation of therapy in patients with ischemic heart disease or cerebrovascular disease warrants close observation due to the potential consequences posed by falling blood pressure (eg, MI, stroke). Fluid replacement, if needed, may restore blood pressure; therapy may then be resumed. Discontinue therapy in patients whose hypotension recurs.

- Collagen vascular disease: Use enalapril with caution in patients with collagen vascular disease especially with concomitant renal impairment; may be at increased risk for hematologic toxicity. Hydrochlorothiazide can cause systemic lupus erythematosus (SLE) exacerbation or activation.

- Diabetes: Use hydrochlorothiazide with caution in patients with prediabetes or diabetes mellitus; may see a change in glucose control.

- Gout: In certain patients with a history of gout, a familial predisposition to gout, or chronic renal failure, gout can be precipitated by hydrochlorothiazide.

- Hepatic impairment: Use caution in patients with severe hepatic impairment; in cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.

- Hypercholesterolemia: Use with caution in patients with moderate or high cholesterol concentrations; increased cholesterol and triglyceride levels have been reported with thiazides.

- Hypertrophic cardiomyopathy (HCM) with outflow tract obstruction: Use with caution in patients with HCM and outflow tract obstruction since reduction in afterload may worsen symptoms associated with this condition.

- Renal artery stenosis: Use fosinopril with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.

- Renal impairment: Use ACE inhibitors with caution in pre-existing renal insufficiency; not recommended for use in patients with Cl_{cr} <30 mL/minute or serum creatinine ≥3 mg/dL. Avoid rapid dosage escalation which may lead to further renal impairment. Contraindicated in anuric patients.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

- Pregnancy: **[U.S. Boxed Warning]: Based on human data, ACEIs can cause injury and death to the developing fetus when used in the second and third trimesters. ACEIs should be discontinued as soon as possible once pregnancy is detected.**

Other warnings/precautions:

- Surgery: Use with caution before, during, or immediately after major surgery. Cardiopulmonary bypass, intraoperative blood loss or vasodilating anesthesia increases endogenous renin release. Use of ACE inhibitors perioperatively will blunt angiotensin II formation and may result in hypotension.

Pregnancy Risk FactorC (1st trimester); D (2nd and 3rd trimester)

Pregnancy Considerations **[U.S. Boxed Warning]: Based on human data, ACEIs can cause injury and death to the developing fetus when used in the second and third trimesters. ACEIs should be discontinued as soon as possible once pregnancy is detected.** See individual agents.

LactationEnters breast milk/contraindicated

Adverse Reactions

2% to 10%:

Central nervous system: Headache (7%, less than placebo), fatigue (4%), dizziness (3%), orthostatic hypotension (2%)

Neuromuscular & skeletal: Musculoskeletal pain (2%)

Respiratory: Cough (6%), upper respiratory infection (2%, less than placebo)

<2%: Abdominal pain, angioedema, breast mass, BUN elevation (similar to placebo), chest pain, creatinine elevation (similar to placebo), depression, diarrhea, dyspepsia, dysuria, edema, eosinophilia, esophagitis, fever, flushing, gastritis, gout, heartburn, hepatic necrosis, leukopenia, libido change, liver function test elevations (transaminases, LDH, alkaline phosphatase, serum bilirubin), muscle cramps, myalgia, nausea, neutropenia, numbness, paresthesia, pharyngitis, pruritus, rash, rhinitis, sexual dysfunction, sinus congestion, somnolence, syncope, tinnitus, urinary frequency, urinary tract infection, viral infection, vomiting, weakness

Other adverse events reported with **ACE inhibitors**: Aplastic anemia, bullous pemphigus, cardiac arrest, cholestatic jaundice, exfoliative dermatitis, hemolytic anemia, hyperkalemia, pancreatitis, pancytopenia, photosensitivity; syndrome that may include one or more of arthralgia/arthritis, vasculitis, serositis, myalgia, fever, rash or other dermopathy, positive ANA titer, leukocytosis, eosinophilia, and elevated ESR; thrombocytopenia

Other adverse events reported with **hydrochlorothiazide**: Agranulocytosis, anaphylactic reactions, anorexia, blurred vision (transient), constipation, cramping, glucosuria, hemolytic anemia, hypercalcemia, hyperglycemia, hyperuricemia, hypokalemia, jaundice (intrahepatic cholestatic), lightheadedness, muscle spasm, necrotizing angiitis, pancreatitis, photosensitivity, pneumonitis, pulmonary edema, purpura, respiratory distress, restlessness, sialadenitis, SLE, Stevens-Johnson syndrome, urticaria, vertigo, xanthopsia

Drug Interactions

ACE Inhibitors: Thiazide Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: ACE Inhibitors may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. *Risk D: Consider therapy modification*

Allopurinol: Thiazide Diuretics may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. Thiazide Diuretics may increase the serum concentration of Allopurinol. Specifically, Thiazide Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Angiotensin II Receptor Blockers: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Antacids: May decrease the serum concentration of ACE Inhibitors. *Risk C: Monitor therapy*

Aprotinin: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

AzaTHIOprine: ACE Inhibitors may enhance the neutropenic effect of AzaTHIOprine. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Calcitriol: Thiazide Diuretics may enhance the hypercalcemic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Salts: Thiazide Diuretics may decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

CycloSPORINE: ACE Inhibitors may enhance the nephrotoxic effect of CycloSPORINE. *Risk D: Consider therapy modification*

Dofetilide: Thiazide Diuretics may enhance the QTc-prolonging effect of Dofetilide. Thiazide Diuretics may increase the serum concentration of Dofetilide. *Risk D: Consider therapy modification*

Eplerenone: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Ferric Gluconate: ACE Inhibitors may enhance the adverse/toxic effect of Ferric Gluconate. *Risk C: Monitor therapy*

Gold Sodium Thiomalate: ACE Inhibitors may enhance the adverse/toxic effect of Gold Sodium Thiomalate. An increased risk of nitritoid reactions has been appreciated. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: Thiazide Diuretics may decrease the excretion of Lithium. *Risk D: Consider therapy modification*

Lithium: ACE Inhibitors may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Loop Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Salicylates: May diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Sirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Temsirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Thiazide Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Trimethoprim: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Hydrochlorothiazide peak serum levels may be decreased if taken with food.

Herb/Nutraceutical: Avoid dong quai (has estrogenic activity, may also cause photosensitization). Avoid ephedra, yohimbe, ginseng (may worsen hypertension). Avoid garlic (may have increased antihypertensive effect).

Test InteractionsDiscontinue prior to parathyroid function test; digoxin levels if using Digi-Tab RIA kit

Monitoring ParametersBlood pressure; BUN, serum creatinine, and electrolytes; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential

Monitoring: Lab TestsBUN, serum creatinine, and electrolytes; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 10/12.5: Fosinopril sodium 10 mg and hydrochlorothiazide 12.5 mg; 20/12.5: Fosinopril sodium 20 mg and hydrochlorothiazide 12.5 mg

Monopril-HCT® 10/12.5: Fosinopril sodium 10 mg and hydrochlorothiazide 12.5 mg

Monopril-HCT® 20/12.5: Fosinopril sodium 20 mg and hydrochlorothiazide 12.5 mg

Generic AvailableYes

ManufacturerBristol-Myers Squibb Company (Pharmaceutical Division)

Pricing: U.S. (www.drugstore.com)

Tablets (Fosinopril Sodium-Hydrochlorothiazide)

10-12.5 mg (60): $54.99

20-12.5 mg (60): $54.99

Tablets (Monopril HCT)

10-12.5 mg (60): $86.09

20-12.5 mg (60): $86.09

Mechanism of ActionFosinopril is a competitive inhibitor of angiotensin-converting enzyme (ACE); prevents conversion of angiotensin I to angiotensin II, a potent vasoconstrictor; results in lower levels of angiotensin II which causes an increase in plasma renin activity and a reduction in aldosterone secretion; a CNS mechanism may also be involved in hypotensive effect as angiotensin II increases adrenergic outflow from CNS; vasoactive kallikreins may be decreased in conversion to active hormones by ACE inhibitors, thus reducing blood pressure. Hydrochlorothiazide inhibits sodium reabsorption in the distal tubules causing increased excretion of sodium and water as well as potassium and hydrogen ions.

Pharmacodynamics/KineticsSee individual agents.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness or dizziness; may rarely cause depression

Mental Health: Effects on Psychiatric TreatmentNeutropenia and agranulocytosis may rarely occur; use caution with clozapine and carbamazepine. Thiazide diuretics may decrease the renal clearance of lithium increasing the risk for toxicity; monitor. May cause photosensitivity; concomitant use with psychotropics may further the risk. Use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight.

Cardiovascular ConsiderationsCombination therapy for the treatment of hypertension should be individualized for each patient. Potential advantages for fosinopril and hydrochlorothiazide combination therapy may include improved compliance and synergistic reductions in blood pressure with an accompanying reduction in side effects. ACE inhibitors and thiazides are also standard therapy for left ventricular systolic dysfunction.

Index Terms Hydrochlorothiazide and Fosinopril

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Fosinopril may be confused with lisinopril

Monopril® may be confused with Accupril®, minoxidil, moexipril, Monoket®, Monurol™, ramipril

Pronunciation(foe SIN oh pril)

U.S. Brand NamesMonopril®

Canadian Brand NamesApo-Fosinopril®; Gen-Fosinopril; Lin-Fosinopril; Monopril®; Novo-Fosinopril; PMS-Fosinopril; RAN-Fosinopril; ratio-Fosinopril; Riva-Fosinopril

Pharmacologic CategoryAngiotensin-Converting Enzyme (ACE) Inhibitor

Use: Labeled IndicationsTreatment of hypertension, either alone or in combination with other antihypertensive agents; treatment of heart failure (HF)

Dosing: Adults

Hypertension: Oral: Initial: 10 mg/day; increase to a maximum dose of 80 mg/day. Most patients are maintained on 20-40 mg/day. May need to divide the dose into two if trough effect is inadequate. Discontinue the diuretic, if possible 2-3 days before initiation of therapy. Resume diuretic therapy carefully, if needed.

Heart failure: Oral: Initial: 10 mg/day (5 mg if renal dysfunction present) and increase, as needed, to a maximum of 40 mg once daily over several weeks. Usual dose: 20-40 mg/day. If hypotension, orthostasis, or azotemia occurs during titration, consider decreasing concomitant diuretic dose, if any.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricHypertension: Children ≥6 years and >50 kg: Oral: Initial: 5-10 mg once daily (maximum: 40 mg/day)

Dosing: Renal ImpairmentNone needed since hepatobiliary elimination compensates adequately diminished renal elimination.

Hemodialysis: Moderately dialyzable (20% to 50%)

Dosing: Hepatic ImpairmentDecrease dose and monitor effects

Dietary ConsiderationsShould not take a potassium salt supplement without the advice of healthcare provider.

StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Protect from moisture by keeping bottle tightly closed.

ContraindicationsHypersensitivity to fosinopril, any other ACE inhibitor, or any component of the formulation; angioedema related to previous treatment with an ACE inhibitor

Allergy Considerations

- ACE Inhibitor Allergy/Hypersensitivity

Warnings/Precautions

Boxed warnings:

- Pregnancy: See “Special populations” below.

Concerns related to adverse effects:

- Angioedema: At any time during treatment (especially following first dose), angioedema may occur rarely with ACE inhibitors; it may involve the head and neck (potentially compromising airway) or the intestine (presenting with abdominal pain). African-Americans and patients with idiopathic or hereditary angioedema may be at an increased risk. Prolonged frequent monitoring may be required especially if tongue, glottis, or larynx are involved as they are associated with airway obstruction. Patients with a history of airway surgery may have a higher risk of airway obstruction. Aggressive early and appropriate management is critical. Use in patients with previous angioedema associated with ACE inhibitor therapy is contraindicated.

- Cholestatic jaundice: A rare toxicity associated with ACE inhibitors includes cholestatic jaundice, which may progress to fulminant hepatic necrosis; discontinue if marked elevation of hepatic transaminases or jaundice occurs.

- Cough: An ACE inhibitor cough is a dry, hacking, nonproductive one that usually occurs within the first few months of treatment and should generally resolve within 1-4 weeks after discontinuation of the ACE inhibitor. Other causes of cough should be considered (eg, pulmonary congestion in patients with heart failure) and excluded prior to discontinuation.

- Hyperkalemia: May occur with ACE inhibitors; risk factors include renal dysfunction, diabetes mellitus, concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salts. Use cautiously, if at all, with these agents and monitor potassium closely.

- Hypersensitivity reactions: Anaphylactic/anaphylactoid reactions can occur with ACE inhibitors. Severe anaphylactoid reactions may be seen during hemodialysis (eg, CVVHD) with high-flux dialysis membranes (eg, AN69), and rarely, during low density lipoprotein apheresis with dextran sulfate cellulose. Rare cases of anaphylactoid reactions have been reported in patients undergoing sensitization treatment with hymenoptera (bee, wasp) venom while receiving ACE inhibitors.

- Hypotension/syncope: Symptomatic hypotension with or without syncope can occur with ACE inhibitors (usually with the first several doses); effects are most often observed in volume-depleted patients; correct volume depletion prior to initiation; close monitoring of patient is required especially with initial dosing and dosing increases; blood pressure must be lowered at a rate appropriate for the patient's clinical condition. Although dose reduction may be necessary, hypotension is not a reason for discontinuation of future ACE inhibitor use especially in patients with heart failure where a reduction in systolic blood pressure is a desirable observation.

- Neutropenia/agranulocytosis: Another ACE Inhibitor, captopril, has been associated with rare cases of agranulocytosis, neutropenia, or leukopenia with myeloid hypoplasia. Patients with renal impairment are at high risk of developing neutropenia. Patients with both renal impairment and collagen vascular disease (eg, systemic lupus erythematosus) are at an even higher risk of developing neutropenia. Periodically monitor CBC with differential in these patients.

- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

Disease-related concerns:

- Aortic stenosis: Use with caution in patients with severe aortic stenosis; may reduce coronary perfusion resulting in ischemia.

- Cardiovascular disease: Initiation of therapy in patients with ischemic heart disease or cerebrovascular disease warrants close observation due to the potential consequences posed by falling blood pressure (eg, MI, stroke). Fluid replacement, if needed, may restore blood pressure; therapy may then be resumed. Discontinue therapy in patients whose hypotension recurs.

- Collagen vascular disease: Use with caution in patients with collagen vascular disease especially with concomitant renal impairment; may be at increased risk for hematologic toxicity.

- Hypertrophic cardiomyopathy (HCM) with outflow tract obstruction: Use with caution in patients with HCM and outflow tract obstruction since reduction in afterload may worsen symptoms associated with this condition.

- Renal artery stenosis: Use with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.

- Renal impairment: Use with caution in pre-existing renal insufficiency; dosage adjustment may be needed. Avoid rapid dosage escalation which may lead to further renal impairment.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <6 years of age.

- Pregnancy: **[U.S. Boxed Warning]: Based on human data, ACEIs can cause injury and death to the developing fetus when used in the second and third trimesters. ACEIs should be discontinued as soon as possible once pregnancy is detected.**

Other warnings/precautions:

- Surgery: Use with caution before, during, or immediately after major surgery. Cardiopulmonary bypass, intraoperative blood loss or vasodilating anesthesia increases endogenous renin release. Use of ACE inhibitors perioperatively will blunt angiotensin II formation and may result in hypotension.

Geriatric ConsiderationsDue to frequent decreases in glomerular filtration (also creatinine clearance) with aging, elderly patients may have exaggerated responses to ACE inhibitors. Differences in clinical response due to hepatic changes are not observed. ACE inhibitors may be preferred agents in elderly patients with congestive heart failure and diabetes mellitus. Diabetic proteinuria is reduced and insulin sensitivity is enhanced. In general, the side effect profile is favorable in the elderly and causes little or no CNS confusion; use lowest dose recommendations initially. Many elderly may be volume depleted due to diuretic use and/or blunted thirst reflex resulting in inadequate fluid intake.

Pregnancy Risk FactorC (1st trimester); D (2nd and 3rd trimesters)

Pregnancy ConsiderationsDue to adverse events observed in some animal studies, fosinopril is considered pregnancy category C during the first trimester. Based on human data, fosinopril is considered pregnancy category D if used during the second and third trimesters (per the manufacturer; however, one study suggests that fetal injury may occur at anytime during pregnancy). First trimester exposure to ACE inhibitors may cause major congenital malformations. An increased risk of cardiovascular and/or central nervous system malformations was observed in one study; however, an increased risk of teratogenic events was not observed in other studies. Second and third trimester use of an ACE inhibitor is associated with oligohydramnios. Oligohydramnios due to decreased fetal renal function may lead to fetal limb contractures, craniofacial deformation, and hypoplastic lung development. The use of ACE inhibitors during the second and third trimesters is also associated with anuria, hypotension, renal failure (reversible or irreversible), skull hypoplasia, and death in the fetus/neonate. Chronic maternal hypertension itself is also associated with adverse events in the fetus/infant. ACE inhibitors are not recommended during pregnancy to treat maternal hypertension or heart failure. Those who are planning a pregnancy should be considered for other medication options if an ACE inhibitor is currently prescribed or the ACE inhibitor should be discontinued as soon as possible once pregnancy is detected. The exposed fetus should be monitored for fetal growth, amniotic fluid volume, and organ formation. Infants exposed to an ACE inhibitor *in utero*, especially during the second and third trimester, should be monitored for hyperkalemia, hypotension, and oliguria.

[U.S. Boxed Warning]: Based on human data, ACE inhibitors can cause injury and death to the developing fetus when used in the second and third trimesters. ACE inhibitors should be discontinued as soon as possible once pregnancy is detected.

Lactation Enters breast milk/not recommended

Breast-Feeding Considerations Fosinoprilat is excreted in breast milk. Breast-feeding is not recommended by the manufacturer.

Pregnancy & Lactation, In-Depth

- Fosinopril in Pregnancy & Lactation

Adverse Reactions **Note:** Frequency ranges include data from hypertension and heart failure trials. Higher rates of adverse reactions have generally been noted in patients with CHF. However, the frequency of adverse effects associated with placebo is also increased in this population.

>10%: Central nervous system: Dizziness (2% to 12%)

1% to 10%:

Cardiovascular: Orthostatic hypotension (1% to 2%), palpitation (1%)

Central nervous system: Dizziness (1% to 2%; up to 12% in CHF patients), headache (3%), fatigue (1% to 2%)

Endocrine & metabolic: Hyperkalemia (2.6%)

Gastrointestinal: Diarrhea (2%), nausea/vomiting (1.2% to 2.2%)

Hepatic: Transaminases increased

Neuromuscular & skeletal: Musculoskeletal pain (<1% to 3%), noncardiac chest pain (<1% to 2%), weakness (1%),

Renal: Serum creatinine increased, renal function worsening (in patients with bilateral renal artery stenosis or hypovolemia)

Respiratory: Cough (2% to 10%)

Miscellaneous: Upper respiratory infection (2%)

>1% but ≤ frequency in patients receiving placebo: Sexual dysfunction, fever, flu-like syndrome, dyspnea, rash, headache, insomnia

<1% (Limited to important or life-threatening): Abdominal distension, anaphylactoid reaction, angina, angioedema, arthralgia, behavioral change, bradycardia, bronchospasm, , cerebral infarction, cerebrovascular accident, claudication, confusion, constipation, decreased libido, drowsiness, drowsiness, dysphagia, edema, epistaxis, eye irritation, flatulence, flushing, gout, heartburn, hepatitis, hepatomegaly, hyperhidrosis, hypertension, hypertensive crisis, hypotension, insomnia, laryngitis, lower extremity edema, lymphadenopathy, memory disturbance, MI, mood change, myalgia, numbness, pancreatitis, paresthesia, pharyngitis, photosensitivity, pleuritic chest pain, pruritus, rash, renal insufficiency, shock, sinus abnormality, sleep disturbance, sudden death, syncope, tachycardia, taste disturbance, TIA, tinnitus, tracheobronchitis, tremor, urinary frequency, urticaria, vertigo, vision disturbance, weight gain, xerostomia. In a small number of patients, a symptom complex of cough, bronchospasm, and eosinophilia has been observed with fosinopril.

Other events reported with ACE inhibitors: Acute renal failure, agranulocytosis, anemia, aplastic anemia, bullous pemphigus, cardiac arrest, eosinophilic pneumonitis, exfoliative dermatitis, gynecomastia, hemolytic anemia, hepatic failure, jaundice, neutropenia, pancytopenia, Stevens-Johnson syndrome, symptomatic hyponatremia, thrombocytopenia. In addition, a syndrome which may include fever, myalgia, arthralgia, interstitial nephritis, vasculitis, rash, eosinophilia and positive ANA, and elevated ESR has been reported for other ACE inhibitors.

Drug Interactions

Allopurinol: ACE Inhibitors may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Angiotensin II Receptor Blockers: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Antacids: May decrease the serum concentration of ACE Inhibitors. *Risk C: Monitor therapy*

Aprotinin: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

AzaTHIOprine: ACE Inhibitors may enhance the neutropenic effect of AzaTHIOprine. *Risk C: Monitor therapy*

CycloSPORINE: ACE Inhibitors may enhance the nephrotoxic effect of CycloSPORINE. *Risk D: Consider therapy modification*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Ferric Gluconate: ACE Inhibitors may enhance the adverse/toxic effect of Ferric Gluconate. *Risk C: Monitor therapy*

Gold Sodium Thiomalate: ACE Inhibitors may enhance the adverse/toxic effect of Gold Sodium Thiomalate. An increased risk of nitritoid reactions has been appreciated. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: ACE Inhibitors may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Loop Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Salicylates: May diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Sirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Temsirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Thiazide Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Trimethoprim: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid bayberry, blue cohosh, cayenne, ephedra, ginger, ginseng (American), kola, licorice (may worsen hypertension). Avoid black cohosh, california poppy, coleus, golden seal, hawthorn, mistletoe, periwinkle, quinine, shepherd's purse (may have increased antihypertensive effect).

Test InteractionsPositive Coombs' [direct]; may cause false-positive results in urine acetone determinations using sodium nitroprusside reagent

Monitoring ParametersBlood pressure; serum creatinine and potassium; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential

Nursing: Physical Assessment/MonitoringUse with caution in presence of renal impairment, hypovolemia, aortic stenosis, and postanesthesia. Assess potential for interactions with other pharmacological agents or herbal products patient may be taking (especially anything that may impact fluid balance or cardiac status). Assess results of laboratory tests, therapeutic effectiveness according to purpose for use, and adverse response on a regular basis during therapy (eg, anaphylactic reactions, hypovolemia, angioedema, postural hypotension). Teach patient appropriate use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsSerum creatinine and potassium; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential

Patient EducationInform prescriber of all prescriptions, OTC medications, or herbal products you are taking, and any allergies you have. Do not take any new medication during therapy unless approved by prescriber. Do not use potassium supplement or salt substitutes without consulting prescriber. Take exactly as directed; do not discontinue without consulting prescriber. This drug does not eliminate need for diet or exercise regimen as recommended by prescriber. May cause dizziness, fainting, or lightheadedness (use caution when driving or engaging in tasks that require alertness until response to drug is known); postural hypotension (use caution when rising from lying or sitting position or climbing stairs); or nausea, vomiting, abdominal pain, dry mouth, or loss of appetite (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help) - report if these persist. Report chest pain or palpitations; mouth sores; fever or chills; swelling of extremities, face, mouth, or tongue; skin rash; numbness, tingling, or pain in muscles; respiratory difficulty; unusual cough; or other persistent adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Consult prescriber for appropriate contraceptive measures if necessary or if you suspect you might be pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as sodium: 10 mg, 20 mg, 40 mg

Monopril®: 10 mg, 20 mg, 40 mg

Generic AvailableYes

ManufacturerBristol-Myers Squibb Company (Pharmaceutical Division)

Pricing: U.S. (www.drugstore.com)

Tablets (Fosinopril Sodium)

10 mg (60): $59.99

20 mg (60): $59.99

40 mg (30): $30.99

Tablets (Monopril)

10 mg (60): $85.99

20 mg (60): $89.99

40 mg (60): $88.93

Mechanism of ActionCompetitive inhibitor of angiotensin-converting enzyme (ACE); prevents conversion of angiotensin I to angiotensin II, a potent vasoconstrictor; results in lower levels of angiotensin II which causes an increase in plasma renin activity and a reduction in aldosterone secretion; a CNS mechanism may also be involved in hypotensive effect as angiotensin II increases adrenergic outflow from CNS; vasoactive kallikreins may be decreased in conversion to active hormones by ACE inhibitors, thus reducing blood pressure

Pharmacodynamics/Kinetics

Onset of action: 1 hour

Duration: 24 hours

Absorption: 36%

Protein binding: 95%

Metabolism: Prodrug, hydrolyzed to its active metabolite fosinoprilat by intestinal wall and hepatic esterases

Bioavailability: 36%

Half-life elimination, serum (fosinoprilat): 12 hours

Time to peak, serum: ~3 hours

Excretion: Urine and feces (as fosinoprilat and other metabolites in roughly equal proportions, 45% to 50%)

Related Information

- Angiotensin Agents
- Heart Failure (Systolic)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Orthostatic hypotension.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness or dizziness; may rarely cause insomnia

Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine and carbamazepine; may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels

Cardiovascular Considerations

Congestive Heart Failure: The ACC/AHA 2005 Heart Failure Guidelines recommend that ACE inhibitors be used in patients with a reduced EF (with or without heart failure symptoms) unless contraindicated. ACE inhibitors decrease morbidity and mortality in patients with asymptomatic and symptomatic left ventricular dysfunction. In this situation, they decrease hospitalizations for, and retard progression to, congestive heart failure. When used in patients with heart failure, the target dose should be achieved, if possible. Lower daily doses of ACE inhibitors have demonstrated the same mortality effects as high doses, but have not decreased hospitalizations to the extent that high-dose ACE inhibitors have, as demonstrated in the ATLAS study (Packer M, 1999).

Hypertension: The ALLHAT study (ALLHAT Collaborative Group, 2002) compared CV outcomes of lisinopril, amlodipine, or chlorthalidone in hypertensive patients having at least one other risk factor for coronary heart disease. Investigators found no difference between the groups on the primary outcome of fatal coronary disease or nonfatal MI. The ACC/AHA 2005 Heart Failure Guidelines suggest that ACE inhibitors or angiotensin receptor blockers (ARBs) can be beneficial in patients with hypertension and LVH without symptoms of heart failure. JNC 7 suggests that patients can benefit from treatment with an ACE inhibitor if they have hypertension **and** heart failure, acute myocardial infarction, high coronary disease risk, diabetes, chronic kidney disease, a history of stroke.

Vascular Disease: The ACC/AHA 2005 Heart Failure Guidelines suggest that ACE inhibitors can be useful in preventing heart failure in patients who have a history of atherosclerotic vascular disease, diabetes, or hypertension with associated cardiovascular risk factors. The HOPE trial (Heart Outcomes Prevention Evaluation Study Investigators, 2000) investigated the value of an ACE inhibitor (ramipril 5-10 mg daily) versus placebo in patients who had evidence of vascular disease or diabetes (one other cardiovascular risk factor) and were at least 55 years of age. Patients were excluded if they had a low ejection fraction, heart failure, or were on an ACE inhibitor. The primary outcome was a composite of death from cardiovascular cause, myocardial infarction, or stroke; 9297 patients were enrolled and randomized. Ramipril significantly reduced the risk of death from CV causes, MI, or stroke over placebo. New cases of diabetes were also reduced in the ramipril group. In the EUROPA trial, patients with stable coronary artery disease (at low risk for cardiovascular events) received perindopril or placebo and were evaluated for incidence of cardiovascular events after four years of treatment. In this randomized, placebo-controlled, prospective study, 12,218 patients received either perindopril (8 mg/day, n=6110) or placebo (n=6108) and were assessed for the primary endpoint of a cardiovascular event, defined as cardiovascular death, myocardial infarction, or cardiac arrest. The study population was well balanced with respect to baseline demographics and concomitant medication use (including beta-blockers, platelet inhibitors, antihyperlipidemics, calcium channel blockers, nitrates, and diuretics). Intent-to-treat analysis revealed that 603 (10%) of placebo patients experienced the primary endpoint of a cardiovascular event compared to 488 (8%) of perindopril-receiving patients, for a 20% relative risk reduction (p=0.0003). This result was not influenced by presence of other comorbidities (eg, diabetes, hypertension) or concomitant beta-blocker, calcium channel blocker, or lipid-lowering therapies. Withdrawal from the study (postrandomization) due to adverse reactions was similar between treatment groups. Number needed to treat analysis suggests that treatment of 50 patients over a 4-year period will prevent one major cardiovascular event.

Acute Coronary Syndromes: In the treatment of unstable angina/non-ST-segment elevation MI, ACE inhibitors are recommended when hypertension persists despite treatment with nitroglycerin and a beta-blocker in patients with LV systolic dysfunction or CHF and in ischemic patients with diabetes (Class I). ACE inhibitors are also recommended for all post-ACS individuals (Class IIa). According to 2004 ACC/AHA STEMI guidelines, an ACE inhibitor should be administered orally within the first 24 hours of STEMI to patients with anterior infarction, pulmonary congestion, or LVEF <0.4, in the absence of hypotension or known contraindications to this class of medicines. In the emergency management of complicated STEMI, a short-acting ACEI (eg, captopril 1-6.25 mg) may be added once the patient's systolic blood pressure is >100 mm Hg and not <30 mm Hg below baseline. The VALIANT trial evaluated the effects of valsartan (target dose: 160 mg twice daily), captopril (target dose: 50 mg twice daily), and the combination (target doses: valsartan 80 mg twice daily and captopril 150 mg once daily) in a randomized, double-blind trial of patients with acute MI (0.5-10 days post-MI) complicated by left ventricular systolic dysfunction, heart failure, or both. Enrollment in the study numbered 14,703 patients and followed for a median of 24.7 months. There was no difference in the primary endpoint (all cause mortality) among the 3 groups. There was no difference in incidence of CV death, recurrent MI, or hospitalization for heart failure either. Hypotension and renal dysfunction occurred significantly more often in the valsartan group than captopril alone. Cough, rash, and taste disturbances occurred more often in the captopril group. The authors (Pfeffer MA, 2003) concluded that valsartan is as effective as captopril in patients who are at high risk for cardiovascular events after MI. Combining valsartan with captopril increased the rate of adverse events without improving survival.

Potential Adverse Events: ACE inhibitor therapy may elicit rapid increases in potassium and creatinine, especially when used in patients with bilateral renal artery stenosis. When ACE inhibition is introduced in patients with pre-existing diuretic therapy who are hypovolemic, the ACE inhibitor may induce acute hypotension. In those patients experiencing cough on an ACE inhibitor, the ACE inhibitor may be discontinued and, if necessary, ARB therapy instituted. Because of the potent teratogenic effects of ACE inhibitors, these drugs should be avoided, if possible, when treating women of childbearing potential not on effective birth control measures.

Drug Interactions: Concomitant indomethacin therapy may blunt the reduction in sitting and 24-hour ambulatory diastolic blood pressure. Use of NSAIDs should be avoided or limited, with monitoring of blood pressure control in this setting. In patients with heart failure, NSAID use may be associated with an increased risk for fluid accumulation and edema.

Anesthesia and Critical Care Concerns/Other ConsiderationsACE inhibitor therapy may elicit rapid increases in potassium and creatinine, especially when used in patients with bilateral renal artery stenosis. When ACE inhibition is introduced in patients with pre-existing diuretic therapy who are hypovolemic, the ACE inhibitor may induce acute hypotension. Concomitant NSAID therapy may attenuate blood pressure control; use of NSAIDs should be avoided or limited, with monitoring of blood pressure control. Because of the potent teratogenic effects of ACE inhibitors, these drugs should be avoided, if possible, when treating women of childbearing potential not on effective birth control measures.

ACE inhibitors decrease morbidity and mortality in patients with asymptomatic and symptomatic left ventricular dysfunction. ACE inhibitors are also indicated in patients postmyocardial infarction in whom left ventricular ejection fraction is <40%. ACE inhibitors have renal protective effects in patients with proteinuria and possibly cardioprotective effects in high-risk patients.

Index TermsFosinopril Sodium

Phenytoin and Fosphenytoin: Genetic Susceptibility to Serious Skin Reactions - November 2008

The U.S. Food and Drug Administration (FDA) is notifying healthcare professionals of preliminary information concerning the potential for serious skin reactions in susceptible patients treated with phenytoin (or fosphenytoin). Data suggests that patients testing positive for the human leukocyte antigen (HLA) allele *HLA-B*1502* have an increased risk of developing Stevens-Johnson syndrome (SJS) and/or toxic epidermal necrolysis (TEN). The risk appears to be highest in the early months of therapy initiation. The presence of this genetic variant exists in up to 15% of people of Asian descent in China, Thailand, Malaysia, Indonesia, Taiwan, and the Philippines, and may vary from <1% in Japanese and Koreans, to 2% to 4% of South Asians and Indians. This variant is virtually absent in those of Caucasian, African-American, Hispanic, or European ancestry. Of note, carbamazepine, another antiepileptic with a chemical structure similar to phenytoin, updated its prescribing information (December 2007) to include a warning of an increased risk of SJS and TEN in patients carrying the *HLA-B*1502* allele and a recommendation to screen patients of Asian descent for the allele prior to initiating therapy. In contrast to carbamazepine, the FDA is not recommending testing for the presence of *HLA-B*1502* prior to initiating phenytoin therapy until more information is available. In the interim, the FDA is advising that prescribers avoid phenytoin or fosphenytoin as alternatives to carbamazepine therapy in patients positive for *HLA-B*1502*.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Phenytoin

Medication Safety Issues

Sound-alike/look-alike issues:

> Cerebyx® may be confused with Celebrex®, Celexa™, Cerezyme®

Overdoses have occurred due to confusion between the **mg per mL concentration** of fosphenytoin (50 mg PE/mL) and **total drug content per vial** (either 100 mg PE/2 mL vial or 500 mg PE/10 mL vial). ISMP recommends that the total drug content per container is identified instead of the concentration in mg per mL to avoid confusion and potential overdosages. Additionally, since most errors have occurred with overdoses in children, they recommend that pediatric hospitals should consider stocking only the 2 mL vial.

Pronunciation(FOS fen i toyn)

U.S. Brand NamesCerebyx®

Canadian Brand NamesCerebyx®

Pharmacologic CategoryAnticonvulsant, Hydantoin

Use: Labeled IndicationsUsed for the control of generalized convulsive status epilepticus and prevention and treatment of seizures occurring during neurosurgery; indicated for short-term parenteral administration when other means of phenytoin administration are unavailable, inappropriate, or deemed less advantageous (the safety and effectiveness of fosphenytoin in this use has not been systematically evaluated for more than 5 days)

Dosing: Adults

The dose, concentration in solutions, and infusion rates for fosphenytoin are expressed as phenytoin sodium equivalents (PE); fosphenytoin should always be prescribed and dispensed in phenytoin sodium equivalents (PE)

Status epilepticus: I.V.: Loading dose: 15-20 mg PE/kg I.V. administered at 100-150 mg PE/minute

Nonemergent loading and maintenance dosing: I.V. or I.M.:

> *Loading dose:* 10-20 mg PE/kg I.V. or I.M. (maximum I.V. rate: 150 mg PE/minute)
>
> *Initial daily maintenance dose:* 4-6 mg PE/kg/day I.V. or I.M.

Substitution for oral phenytoin therapy: I.M. or I.V.: May be substituted for oral phenytoin sodium at the same total daily dose; however, Dilantin® capsules are ~90% bioavailable by the oral route; phenytoin, supplied as fosphenytoin, is 100% bioavailable by both the I.M. and I.V. routes; for this reason, plasma phenytoin concentrations may increase when I.M. or I.V. fosphenytoin is substituted for oral phenytoin sodium therapy; in clinical trials, I.M. fosphenytoin was administered as a single daily dose utilizing either 1 or 2 injection sites; some patients may require more frequent dosing

Dosing: ElderlyPhenytoin clearance is decreased in geriatric patients; lower doses may be required. In addition, older adults may have lower serum albumin which may increase the free fraction and, therefore, pharmacologic response. Refer to adult dosing.

Dosing: Pediatric

Note: The dose, concentration in solutions, and infusion rates for fosphenytoin are expressed as phenytoin sodium equivalents (PE); fosphenytoin should

always be prescribed and dispensed in phenytoin sodium equivalents (PE).

Infants and Children (unlabeled use): I.V.:

Loading dose: 10-20 mg PE/kg for the treatment of generalized convulsive status epilepticus.

Maintenance dosing: Phenytoin dosing guidelines in pediatric patients are used when dosing fosphenytoin using doses in PE equal to the phenytoin doses (ie, phenytoin 1 mg = fosphenytoin 1 PE); maintenance doses may be started 8-12 hours after a loading dose

Dosing: Renal ImpairmentFree phenytoin levels should be monitored closely in patients with renal disease or in those with hypoalbuminemia; furthermore, fosphenytoin clearance to phenytoin may be increased without a similar increase in phenytoin clearance in these patients leading to increase frequency and severity of adverse events.

Dosing: Hepatic ImpairmentPhenytoin clearance may be substantially reduced in cirrhosis and plasma level monitoring with dose adjustment advisable. Free phenytoin levels should be monitored closely in patients with hepatic disease or in those with hypoalbuminemia; furthermore, fosphenytoin clearance to phenytoin may be increased without a similar increase in phenytoin clearance in these patients leading to increased frequency and severity of adverse events.

Administration: I.M.I.M. may be administered as a single daily dose using either 1 or 2 injection sites.

Administration: I.V.Rates of infusion:

Children: 1-3 mg PE/kg/minute

Adults: Should not exceed 150 mg PE/minute

Dietary ConsiderationsProvides phosphate 0.0037 mmol/mg PE fosphenytoin

StorageRefrigerate at 2°C to 8°C (36°F to 46°F). Do not store at room temperature for more than 48 hours. Do not use vials that develop particulate matter.

ReconstitutionMust be diluted to concentrations of 1.5-25 mg PE/mL, in normal saline or D_5W, for I.V. infusion.

CompatibilityStable in D_5LR, $D_5{}^1/_2NS$, D_5W, $D_{10}W$, hetastarch 6% in NS, mannitol 20%, LR, NS.

Y-site administration: Compatible: Lorazepam. **Incompatible:** Midazolam.

Compatibility when admixed: Compatible: Potassium chloride.

ContraindicationsHypersensitivity to phenytoin, other hydantoins, or any component of the formulation; patients with sinus bradycardia, sinoatrial block, second- and third-degree AV block, or Adams-Stokes syndrome; occurrence of rash during treatment (should not be resumed if rash is exfoliative, purpuric, or bullous); treatment of absence seizures

Allergy Considerations

- Aromatic Anticonvulsant Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- Arrhythmias: Administration of phenytoin has been associated with atrial and ventricular conduction depression and ventricular fibrillation; careful cardiac monitoring is needed when administering I.V. loading doses of fosphenytoin.
- Blood dyscrasias: A spectrum of hematologic effects have been reported with use (eg, neutropenia, leukopenia, thrombocytopenia, pancytopenia, and anemias); patients with a previous history of adverse hematologic reaction to any drug may be at increased risk. Early detection of hematologic change is important; advise patients of early signs and symptoms including fever, sore throat, mouth ulcers, infections, easy bruising, petechial or purpuric hemorrhage.
- Dermatologic reactions: Severe reactions, including toxic epidermal necrolysis and Stevens-Johnson syndromes, although rarely reported, have resulted in fatalities; drug should be discontinued if there are any signs of rash. Data suggests a genetic susceptibility for serious skin reactions in patients of Asian descent (see "Special populations" below).
- Hypersensitivity syndrome: Acute hepatotoxicity associated with a hypersensitivity syndrome characterized by fever, skin eruptions, and lymphadenopathy has been reported to occur within the first 2 months of treatment; discontinue if skin rash or lymphadenopathy occurs.
- Hypotension: May occur, especially after I.V. administration at high doses and high rates of administration.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with hypotension and/or severe myocardial insufficiency.
- Diabetes: Use with caution in patients with diabetes mellitus.
- Fever: Use with caution in patients with fever.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Hypoalbuminemia: Use with caution in patients with hypoalbuminemia.
- Hypothyroidism: Use with caution in patients with hypothyroidism.
- Porphyria: Use with caution in patients with porphyria.
- Renal impairment: Use with caution in patients with renal impairment.

Concurrent drug therapy issues:

- Sedatives: Effects with other sedative drugs or ethanol may be potentiated.

Special populations:

- Asian ancestry: Asian patients with the variant *HLA-B*1502* may be at an increased risk of developing Stevens-Johnson syndrome and/or toxic epidermal necrolysis.

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Phenytoin sodium equivalent (PE): Doses of fosphenytoin are expressed as their phenytoin sodium equivalent (PE).

Other warnings/precautions:

- Withdrawal: Anticonvulsants should not be discontinued abruptly because of the possibility of increasing seizure frequency; therapy should be withdrawn gradually to minimize the potential of increased seizure frequency, unless safety concerns require a more rapid withdrawal.

Geriatric ConsiderationsNo significant changes in fosphenytoin pharmacokinetics with age have been noted. Phenytoin clearance is decreased in the elderly and lower doses may be needed. Elderly may have reduced hepatic clearance due to age decline in Phase I metabolism. Elderly may have low albumin which will increase free fraction and, therefore, pharmacologic response. Monitor closely in those who are hypoalbuminemic. Free fraction measurements advised, also elderly may display a higher incidence of adverse effects (cardiovascular) when using the I.V. loading regimen; therefore, it is recommended to decrease loading I.V. dose to 25 mg/minute.

Pregnancy Risk FactorD

Pregnancy ConsiderationsFosphenytoin is the prodrug of phenytoin. Refer to Phenytoin for additional information.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsFosphenytoin is the prodrug of phenytoin. It is not known if fosphenytoin is excreted in breast milk prior to conversion to phenytoin. Refer to Phenytoin monograph for additional information.

Adverse ReactionsThe more important adverse clinical events caused by the I.V. use of fosphenytoin or phenytoin are cardiovascular collapse and/or central nervous system depression. Hypotension can occur when either drug is administered rapidly by the I.V. route. Do not exceed a rate of 150 mg phenytoin equivalent/minute when administering fosphenytoin.

The adverse clinical events most commonly observed with the use of fosphenytoin in clinical trials were nystagmus, dizziness, pruritus, paresthesia, headache, somnolence, and ataxia. Paresthesia and pruritus were seen more often following fosphenytoin (versus phenytoin) administration and occurred more often with I.V. fosphenytoin than with I.M. administration. These events were dose and rate related (doses ≥15 mg/kg at a rate of 150 mg/minute). These sensations, generally described as itching, burning, or tingling are usually not at the infusion site. The location of the discomfort varied with the groin mentioned most frequently. The paresthesia and pruritus were transient events that occurred within several minutes of the start of infusion and generally resolved within 10 minutes after completion of infusion.

Transient pruritus, tinnitus, nystagmus, somnolence, and ataxia occurred 2-3 times more often at doses ≥15 mg/kg and rates ≥150 mg/minute.

I.V. administration (maximum dose/rate):

>10%:

Central nervous system: Nystagmus, dizziness, somnolence, ataxia

Dermatologic: Pruritus

1% to 10%:

Cardiovascular: Hypotension, vasodilation, tachycardia

Central nervous system: Stupor, incoordination, paresthesia, extrapyramidal syndrome, tremor, agitation, hypoesthesia, dysarthria, vertigo, brain edema, headache

Gastrointestinal: Nausea, tongue disorder, dry mouth, vomiting

Neuromuscular & skeletal: Pelvic pain, muscle weakness, back pain

Ocular: Diplopia, amblyopia

Otic: Tinnitus, deafness

Miscellaneous: Taste perversion

I.M. administration (substitute for oral phenytoin):

1% to 10%:

Central nervous system: Nystagmus, tremor, ataxia, headache, incoordination, somnolence, dizziness, paresthesia, reflexes decreased

Dermatologic: Pruritus

Gastrointestinal: Nausea, vomiting

Hematologic/lymphatic: Ecchymosis

Neuromuscular & skeletal: Muscle weakness

<1% (Limited to important or life-threatening): Acidosis, acute hepatic failure, acute hepatotoxicity, alkalosis, anemia, atrial flutter, bundle branch block, cardiac arrest, cardiomegaly, cerebral hemorrhage, cerebral infarct, CHF, cyanosis, dehydration, hyperglycemia, hyperkalemia, hypertension, hypochromic anemia, hypokalemia, hypophosphatemia, ketosis, leukocytosis, leukopenia, lymphadenopathy, palpitation, postural hypotension, pulmonary embolus, QT interval prolongation, sinus bradycardia, syncope, Stevens-Johnson syndrome, thrombocytopenia, thrombophlebitis, toxic epidermal necrolysis, ventricular extrasystoles

Metabolism/Transport EffectsAs phenytoin: **Substrate** of CYP2C9 (major), 2C19 (major), 3A4 (minor); **Induces** CYP2B6 (strong), 2C8 (strong), 2C9 (strong), 2C19 (strong), 3A4 (strong)

Drug Interactions

Acetaminophen: Anticonvulsants (Hydantoin) may increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Antacids: May decrease the serum concentration of Anticonvulsants (Hydantoin). *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May enhance the adverse/toxic effect of Anticonvulsants (Hydantoin). Specifically, osteomalacia and rickets. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

Chloramphenicol: May decrease the metabolism of Anticonvulsants (Hydantoin). Anticonvulsants (Hydantoin) may decrease the serum concentration of Chloramphenicol. Increased chloramphenicol concentrations have also been seen. *Risk D: Consider therapy modification*

Cimetidine: May decrease the metabolism of Anticonvulsants (Hydantoin). *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2B6 Substrates: CYP2B6 Inducers (Strong) may increase the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inducers (Strong): May increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Moderate): May decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Strong): May decrease the metabolism of CYP2C19 Substrates. *Risk D: Consider therapy modification*

CYP2C19 Substrates: CYP2C19 Inducers (Strong) may increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C8 Substrates (High risk): CYP2C8 Inducers (Highly Effective) may increase the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inducers (Highly Effective): May increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Moderate): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Strong): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

CYP2C9 Substrates (High risk): CYP2C9 Inducers (Highly Effective) may increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inducers (Strong) may increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Ketorolac: May diminish the therapeutic effect of Anticonvulsants. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Mefloquine: May diminish the therapeutic effect of Anticonvulsants. Mefloquine may decrease the serum concentration of Anticonvulsants. Management: Mefloquine is contraindicated in persons with a history of convulsions. If anticonvulsant is being used for another indication monitor response to treatment closely, as concurrent mefloquine may decrease response to treatment. *Risk D: Consider therapy modification*

Nilotinib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Nilotinib. *Risk X: Avoid combination*

Nisoldipine: CYP3A4 Inducers (Strong) may decrease the serum concentration of Nisoldipine. *Risk X: Avoid combination*

Ranolazine: CYP3A4 Inducers (Strong) may decrease the serum concentration of Ranolazine. *Risk X: Avoid combination*

Sorafenib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Sorafenib. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol:

Acute use: Avoid or limit ethanol (inhibits metabolism of phenytoin); watch for sedation.

Chronic use: Avoid or limit ethanol (stimulates metabolism of phenytoin).

Test InteractionsIncreased glucose, alkaline phosphatase (S); decreased thyroxine (S), calcium (S); serum sodium increased in overdose setting

Monitoring ParametersContinuous blood pressure, ECG, and respiratory function monitoring with loading dose and for 10-20 minutes following infusion; vital signs, CBC, liver function tests, plasma level monitoring (plasma levels should not be measured until conversion to phenytoin is complete, ~2 hours after an I.V. infusion or ~4 hours after an I.M. injection)

Reference Range

Therapeutic: 10-20 mcg/mL (SI: 40-79 µmol/L); toxicity is measured clinically, and some patients require levels outside the suggested therapeutic range

Toxic: 30-50 mcg/mL (SI: 120-200 µmol/L)

Lethal: >100 mcg/mL (SI: >400 µmol/L)

Manifestations of toxicity:

Nystagmus: 20 mcg/mL (SI: 79 µmol/L)

Ataxia: 30 mcg/mL (SI: 118.9 µmol/L)

Decreased mental status: 40 mcg/mL (SI: 159 µmol/L)

Coma: 50 mcg/mL (SI: 200 µmol/L)

Peak serum phenytoin level after a 375 mg I.M. fosphenytoin dose in healthy males: 5.7 mcg/mL

Peak serum fosphenytoin levels and phenytoin levels after a 1.2 g infusion (I.V.) in healthy subjects over 30 minutes were 129 mcg/mL and 17.2 mcg/mL, respectively

Nursing: Physical Assessment/MonitoringAssess all other medications patient may be taking. Continuous monitoring is essential during infusion and for 30 minutes following infusion. Monitor closely for adverse or overdose reactions during and following infusion.

Monitoring: Lab TestsSerum phenytoin, renal function, albumin

Patient EducationPatients may not be in a position to evaluate their response. If conscious or alert, advise patient to report signs or symptoms of palpitations, racing or falling heartbeat, respiratory difficulty, acute faintness, or CNS disturbances (eg, somnolence, ataxia), and visual disturbances. **Pregnancy precaution:** Inform prescriber if you are pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as sodium: 75 mg/mL (2 mL, 10 mL) [equivalent to phenytoin sodium 50 mg/mL]

Cerebyx®: 75 mg/mL (2 mL, 10 mL) [equivalent to phenytoin sodium 50 mg/mL]

Generic AvailableYes

ManufacturerPfizer Inc (Cerebyx®, Dilantin®)

Mechanism of ActionDiphosphate ester salt of phenytoin which acts as a water soluble prodrug of phenytoin; after administration, plasma esterases convert fosphenytoin to phosphate, formaldehyde, and phenytoin as the active moiety; phenytoin works by stabilizing neuronal membranes and decreasing seizure activity by increasing efflux or decreasing influx of sodium ions across cell membranes in the motor cortex during generation of nerve impulses

Pharmacodynamics/KineticsAlso refer to Phenytoin monograph for additional information.

Protein binding: Fosphenytoin: 95% to 99% to albumin; can displace phenytoin and increase free fraction (up to 30% unbound) during the period required for conversion of fosphenytoin to phenytoin

Metabolism: Fosphenytoin is rapidly converted via hydrolysis to phenytoin; phenytoin is metabolized in the liver and forms metabolites

Bioavailability: I.M.: Fosphenytoin: 100%

Half-life elimination:

Fosphenytoin: 15 minutes

Phenytoin: Variable (mean: 12-29 hours); kinetics of phenytoin are saturable

Time to peak: Conversion to phenytoin: Following I.V. administration (maximum rate of administration): 15 minutes; following I.M. administration, peak phenytoin levels are reached in 3 hours

Excretion: Phenytoin: Urine (as inactive metabolites)

Related Information

- Fosphenytoin and Phenytoin

Pharmacotherapy Pearls1.5 mg fosphenytoin is approximately equivalent to 1 mg phenytoin. Equimolar fosphenytoin dose is 375 mg (75 mg/mL solution) to phenytoin 250 mg (50 mg/mL).

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Tongue disorder and dry mouth.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, drowsiness, or visual hallucinations

Mental Health: Effects on Psychiatric TreatmentMay cause neutropenia; use caution with clozapine and carbamazepine

Cardiovascular ConsiderationsAs with phenytoin, fosphenytoin, when given I.V., can cause marked and dramatic hypotension and reflex tachycardia. Avoid rapid I.V. infusion of fosphenytoin (infusion rates >150 mg of phenytoin equivalent per minute).

Anesthesia and Critical Care Concerns/Other ConsiderationsFosphenytoin 1.5 mg is approximately equivalent to phenytoin 1 mg.

Fosphenytoin is compatible with all diluents; does not require propylene glycol or ethanol for solubility. Since there is no precipitation problem with fosphenytoin, no I.V. filter is required. Formaldehyde production is not expected to be clinically consequential (about 200 mg) if used for 1 week. As with phenytoin, fosphenytoin, when given I.V., can cause marked and dramatic hypotension and reflex tachycardia. Fosphenytoin administration is safer, in that the risk of hypotension may be somewhat less, and there are no adverse effects of extravasation. Avoid rapid I.V. infusion of fosphenytoin (infusion rates >150 mg of phenytoin equivalent per minute). Pruritus can be severe, requiring discontinuation of infusion.

Index Terms Fosphenytoin Sodium

Medication Safety Issues

Product availability: FDA approved December 2008; availability anticipated in April 2009

Sound-alike/look-alike issues:

Fospropofol may be confused with fosaprepitant, fosphenytoin, propofol

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Onset of action: The onset of action will be delayed due to need for conversion to the active metabolite, propofol. If supplemental doses are administered before full effect occurs, the risk of dose-stacking may be elevated resulting in deeper sedation than intended.

Pronunciation

(fos PROE po fole)

U.S. Brand NamesLusedra™

Pharmacologic CategorySedative

Use: Labeled IndicationsMonitored anesthesia care (MAC) sedation in patients undergoing diagnostic or therapeutic procedures

Dosing: Adults**Note: Onset of effect is delayed as compared to propofol-emulsion due to need for conversion to active component.** If <60 kg, base dosing on 60 kg; however, lower doses may be used to achieve lower levels of sedation. If >90 kg, base dosing on 90 kg.

Monitored anesthesia care sedation: I.V.:

Healthy adults <65 years or with mild systemic disease (ASA-PS1 or -PS2): *Standard dosing regimen:* Initial: 6.5 mg/kg (maximum initial dose: 577.5 mg or 16.5 mL), followed by supplemental doses of 1.6 mg/kg (maximum supplemental dose: 140 mg or 4 mL) no more frequently than every 4 minutes as needed to achieve desired level of sedation.

Patients with severe systemic disease (ASA-PS3 or -PS4): *Modified dosing regimen:* Initial: 4.9 mg/kg (maximum initial dose: 437.5 mg or 12.5 mL), followed by supplemental doses of 1.2 mg/kg (maximum supplemental dose: 105 mg or 3 mL) no more frequently than every 4 minutes as needed to achieve desired level of sedation.

Dosing: Elderly**Note: Onset of effect is delayed as compared to propofol-emulsion due to need for conversion to active component.** If <60 kg, base dosing on 60 kg; however, lower doses may be used to achieve lower levels of sedation. If >90 kg, base dosing on 90 kg.

Monitored anesthesia care sedation: I.V.: Patients ≥65 years:*Modified dosing regimen:* Initial: 4.9 mg/kg (maximum initial dose: 437.5 mg or 12.5 mL), followed by supplemental doses of 1.2 mg/kg (maximum supplemental dose: 105 mg or 3 mL) no more frequently than every 4 minutes as needed to achieve desired level of sedation.

Dosing: Renal ImpairmentNo dosage adjustment recommended. Use with caution in patients with severe renal impairment (Cl_{cr} <30 mL/minute); limited safety and efficacy data available in these patients.

Dosing: Hepatic ImpairmentNo dosage adjustment recommended. Use with caution in patients with hepatic impairment; has not been adequately studied in this population.

Administration: I.V.Administer as an I.V. bolus (no recommendations on rate of administration provided by manufacturer) via a peripheral I.V. line. Flush I.V. line with NS before and after administration. Strict aseptic technique must be maintained in handling. Discard any unused portion at the end of the procedure. Do not filter.

Administration: I.V. DetailpH: 8.2-9.0

StorageStore at controlled room temperature of 25°C (77°F); excursions permitted between 15°C and 30°C (59°F and 86°F).

ReconstitutionSingle-use vials do not need to be diluted prior to administration. Draw into sterile syringes immediately after opening vials. Discard any unused portion at the end of procedure.

CompatibilityDo not mix with other therapeutic agents prior to administration.

Y-site administration: Compatible: $D5_{1/4}NS$, $D5_{1/2}NS$, $D5_{1/2}NS$ with 20 mEq KCl, D_5W, D_5LR, LR, $^1/_2NS$, NS. **Incompatible:** Meperidine, midazolam.

Restrictions**Pending information:** Per the manufacturer, it is likely that fospropofol will be labeled as a C-II

ContraindicationsThere are no contraindications in the manufacturer's FDA approved labeling.

Warnings/Precautions

Concerns related to adverse effects:

- Hypotension: The major cardiovascular effect is hypotension. Use with caution in patients who are hemodynamically unstable, hypovolemic, or have abnormally low vascular tone (eg, sepsis), or compromised myocardial function (eg, heart failure).

- Respiratory depression: May cause loss of spontaneous respiration and/or hypoxemia; supplemental oxygen is recommended for all patients receiving fospropofol; monitor patient closely. The risk of these effects may be increased with the concomitant use of opioids and/or other sedatives.

- Unresponsiveness: May cause patients to become unresponsive or minimally responsive to vigorous tactile or painful stimuli.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; has not been adequately studied in this population.

- Renal impairment: Use with caution in patients with severe renal impairment (Cl_{cr} <30 mL/minute); limited safety and efficacy data available in these patients.

- Respiratory disease: Use with caution in patients with respiratory disease; risk of cardiorespiratory depression may be increased.

- Seizure disorder: Use with caution in patients with a history of epilepsy or seizures; seizure may occur during recovery phase.

Concurrent drug therapy issues:

- Opiates/sedative-hypnotics: Concomitant use may lead to increased sedative or respiratory depressant effects of fospropofol, more pronounced decreases in systolic, diastolic, and mean arterial pressures, heart rate, and cardiac output.

Special populations:

- ASA-PS (American Society of Anesthesiologists - Physical Status) 3/4 patients: Use lower doses in ASA-PS 3/4 patients to reduce the incidence of unwanted cardiorespiratory and neurologic depressive events.

- Elderly: Use lower doses in patients ≥65 years to reduce the incidence of unwanted cardiorespiratory and neurologic depressive events.

- Pediatrics: Safety and efficacy have not been established in patients <18 years of age.

- Pregnancy: Fospropofol should only be used in pregnancy if clearly needed. Not recommended for use in obstetrics, including cesarean section deliveries.

Other warnings/precautions:

- Analgesic supplementation: Fospropofol lacks analgesic properties; pain management requires specific use of analgesic agents.

- Appropriate use: Use only for sedation during procedures as an I.V. bolus with supplemental doses as needed; not recommended for use as a continuous infusion (safety has not been established).

- Experienced personnel: Use requires careful patient monitoring, **should only be used by experienced personnel** who are not actively engaged in the diagnostic or therapeutic procedure. Sedated patients should be continuously monitored, and facilities for maintenance of a patent airway, providing artificial ventilation, administering supplemental oxygen, and instituting cardiovascular resuscitation must be immediately available. Patients should be continuously monitored during sedation and through the recovery process for early signs of hypotension, apnea, airway obstruction, and/or oxygen desaturation. Use to induce moderate (conscious) sedation in patients warrants monitoring equivalent to that seen with general anesthesia.

- Onset of action: The **onset of action will be delayed** due to need for conversion to the active metabolite, propofol. If supplemental doses are administered before full effect occurs, the risk of dose-stacking may be elevated resulting in deeper sedation than intended.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAdverse events were not observed in animal reproduction studies; however, fospropofol should only be used in pregnancy if clearly needed. Fospropofol is not recommended for obstetrics, including cesarean section deliveries. It is not known if fospropofol crosses the placenta. However, propofol crosses the placenta, and therefore, may be associated with neonatal CNS and respiratory depression.

LactationPropofol (the active metabolite of fospropofol) enters breast milk/not recommended

Adverse Reactions

>10%:

Dermatologic: Pruritus (see "Note" below; 8% to 28%)

Neuromuscular & skeletal: Paresthesia (see "Note" below; 52% to 74%)

Respiratory: Hypoxemia (1% to 11%)

1% to 10%:

Cardiovascular: Hypotension (2% to 7%)

Central nervous system: Headache (1% to 2%)

Gastrointestinal: Nausea (≤4%), vomiting (≤3%)

Miscellaneous: Procedural pain (≤2%)

<1%, postmarketing, and/or case reports: Apnea, myoclonus, systolic blood pressure increased, heart rate increased

Note: Paresthesias (including perineal discomfort or burning sensation) and pruritus (including genital, perineal, and generalized pruritus) generally occur within 5 minutes of administration and usually described as mild-moderate in intensity. No pretreatments are helpful in reducing the incidence of these adverse effects.

Metabolism/Transport Effects **Substrate** of CYP1A2 (minor), 2A6 (minor), 2B6 (major), 2C9 (major), 2C19 (minor), 2D6 (minor), 2E1 (minor), 3A4 (minor); **Inhibits** CYP1A2 (moderate), 2C9 (weak), 2C19 (moderate), 2D6 (weak), 2E1 (weak), 3A4 (strong)

Drug Interactions

Alfentanil: May enhance the adverse/toxic effect of Fospropofol. Specifically, the development of opisthotonus (severe hyperextension and spasticity resulting in arching or bridging position) and/or grand mal seizures. *Risk C: Monitor therapy*

CYP2B6 Inhibitors (Moderate): May decrease the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2B6 Inhibitors (Strong): May decrease the metabolism of CYP2B6 Substrates. *Risk D: Consider therapy modification*

Ropivacaine: Fospropofol may increase the serum concentration of Ropivacaine. Specifically, propofol (the active metabolite of fospropofol) is the entity with the potential to interact with ropivacaine. *Risk C: Monitor therapy*

Monitoring Parameters Cardiac monitor, blood pressure, oxygen saturation; patient responsiveness; respiration

Product Availability Lusedra™: FDA approved December 2008; availability anticipated in April 2009

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection [preservative-free]:

Lusedra ™: 35 mg/mL (30 mL)

Generic Available No

Manufacturer Eisai Incorporated

Mechanism of Action Fospropofol disodium is a prodrug of propofol. Propofol interacts with the GABAA receptor, which is the presumed mechanism of action whereby it produces a sedative/hypnotic effect. Propofol is an alkyl-phenolic compound with intravenous general anesthetic properties. The drug is unrelated to any of the currently used barbiturate, opioid, benzodiazepine, arylcyclohexylamine, or imidazole intravenous anesthetic agents.

Pharmacodynamics/Kinetics

Onset of action: Bolus (dose dependent): Attainment of adequate sedation was achieved between 2-28 minutes (median: 8 minutes)

Duration of sedation: Time to fully alert: ≤1 hour (median: 5 minutes)

Distribution:

Fospropofol: V_d: 0.26-0.4 L/kg

Propofol: V_d: ~6 L/kg; decreased in the elderly

Protein binding: Fospropofol: ~98% to albumin; does not affect protein binding of propofol (also ~98% bound to albumin)

Metabolism: Fospropofol is completely metabolized by plasma alkaline phosphatases to propofol, formaldehyde (rapidly converted to formate), and phosphate. Propofol is further metabolized hepatically to water-soluble sulfate and glucuronide conjugates (~50%).

Half-life elimination:

Fospropofol: 0.8-0.96 hours

Propofol: 0.85-1.41 hours

Time to peak: Propofol (from fospropofol): ~12 minutes

Excretion:

Fospropofol: Urine (<0.02% unchanged)

Propofol: Urine (~88% as metabolites, 40% as glucuronide metabolite); feces (<2%)

Mental Health: Effects on Mental Status None reported

Mental Health: Effects on Psychiatric Treatment May produce hypotension and respiratory depression; concomitant use with sedative hypnotics or opiates may produce additive effects.

Medication Safety Issues

International issues:

Allegro® [Germany] may be confused with Allegra® which is a brand name for fexofenadine in the U.S.

Allegro®: Brand name for fluticasone in Israel

Pronunciation(froe va TRIP tan)
U.S. Brand NamesFrova®
Canadian Brand NamesFrova®
Pharmacologic CategoryAntimigraine Agent; Serotonin 5-HT$_{1B, 1D}$ Receptor Agonist
Use: Labeled IndicationsAcute treatment of migraine with or without aura in adults
Dosing: Adults**Migraine:** Oral:

U.S. labeling: 2.5 mg; if headache recurs, a second dose may be given if first dose provided relief and at least 2 hours have elapsed since the first dose (maximum daily dose: 7.5 mg)

Canadian labeling: 2.5 mg; if headache recurs, a second dose may be given if first dose provided relief and at least 4 hours have elapsed since the first dose (maximum daily dose: 5 mg)

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentNo adjustment necessary.
Dosing: Hepatic ImpairmentNo adjustment necessary in mild-to-moderate hepatic impairment; use with caution in severe impairment (has not been studied in severe impairment).

Canadian labeling (not in U.S. labeling): Use is contraindicated in severe hepatic impairment.

Administration: OralAdminister with fluids.
StorageStore at room temperature of 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Protect from moisture and light.
ContraindicationsHypersensitivity to frovatriptan or any component of the formulation; patients with ischemic heart disease or signs or symptoms of ischemic heart disease (including Prinzmetal's angina, angina pectoris, myocardial infarction, silent myocardial ischemia); cerebrovascular syndromes (including strokes, transient ischemic attacks); peripheral vascular syndromes (including ischemic bowel disease); uncontrolled hypertension; use within 24 hours of ergotamine derivatives; use within 24 hours of another 5-HT$_1$ agonist; management of hemiplegic or basilar migraine; prophylactic treatment of migraine

Canadian labeling: Additional contraindications (not in U.S. labeling): Cardiac arrhythmias, valvular heart disease, congenital heart disease, atherosclerotic disease; management of ophthalmoplegic migraine; severe hepatic impairment

Allergy Considerations

- Serotonin 5-HT$_{1B,1D}$ Receptor Agonist Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Cardiac events: Coronary artery vasospasm, transient ischemia, myocardial infarction, ventricular tachycardia/fibrillation, cardiac arrest, and death have been reported with 5-HT$_1$ agonist administration. Patients who experience sensations of chest pain/pressure/tightness or symptoms suggestive of angina following dosing should be evaluated for coronary artery disease or Prinzmetal's angina before receiving additional doses.

- Cerebrovascular events: Cerebral/subarachnoid hemorrhage and stroke have been reported with 5-HT$_1$ agonist administration.

- Elevated blood pressure: Significant elevation in blood pressure, including hypertensive crisis, has also been reported on rare occasions in patients with and without a history of hypertension.

- Vasospasm-related events: Peripheral vascular ischemia and colonic ischemia have been reported with 5-HT$_1$ agonist.

Disease-related concerns:

- Coronary artery disease: Should not be given to patients who have risk factors for CAD (eg, hypertension, hypercholesterolemia, smoker, obesity, diabetes, strong family history of CAD, menopause, male >40 years of age) without adequate cardiac evaluation. Patients with suspected CAD should have cardiovascular evaluation to rule out CAD before considering use; if cardiovascular evaluation “is satisfactory”, first dose should be given in the healthcare provider's office. Periodic evaluation of cardiovascular status should be done in all patients.

- Neurologic disease: Use with caution in patients with epilepsy and structural brain lesions; may lower seizure threshold.

Concurrent drug therapy issues:

- Serotonin syndrome: Symptoms of agitation, confusion, hallucinations, hyper-reflexia, myoclonus, shivering, and tachycardia may occur with concomitant proserotonergic drugs (eg, SSRIs/SNRIs or triptans) or agents which reduce frovatriptan's metabolism. Concurrent use of serotonin precursors (eg, tryptophan) is not recommended.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <18 years of age.

Other warnings/precautions:

- Appropriate use: Only indicated for treatment of acute migraine; if a patient does not respond to the first dose, the diagnosis of migraine should be reconsidered; rule out underlying neurologic disease in patients with atypical headache, migraine (with no prior history of migraine) or inadequate clinical response to initial dosing.

Geriatric ConsiderationsSince elderly often have cardiovascular disease, careful evaluation of the use of 5-HT agonists is needed to avoid complications with the use of these agents. The pharmacokinetic disposition of these agents is similar to that seen in younger adults.

Pregnancy Risk FactorC

Pregnancy ConsiderationsThere are no adequate and well-controlled studies using frovatriptan in pregnant women. Use only if potential benefit to the mother outweighs the potential risk to the fetus.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

1% to 10%:

Cardiovascular: Chest pain (2%), flushing (4%), palpitation (1%)

Central nervous system: Dizziness (8%), fatigue (5%), headache (4%), hot or cold sensation (3%), anxiety (1%), dysesthesia (1%), hypoesthesia (1%), insomnia (1%), pain (1%)

Gastrointestinal: Xerostomia (3%), dyspepsia (2%), abdominal pain (1%), diarrhea (1%), vomiting (1%)

Neuromuscular & skeletal: Paresthesia (4%), skeletal pain (3%)

Ocular: Vision abnormal (1%)

Otic: Tinnitus (1%)

Respiratory: Rhinitis (1%), sinusitis (1%)

Miscellaneous: Diaphoresis (1%)

<1%, postmarketing, and/or case reports: Abnormal dreaming, abnormal gait, abnormal lacrimation, abnormal reflexes, abnormal urine, agitation, amnesia, arthralgia, arthrosis, ataxia, back pain, bradycardia, bullous eruption, cheilitis, concentration impaired, confusion, conjunctivitis, constipation, dehydration, depersonalization, depression, dysphagia, dyspnea, earache, ECG changes, emotional lability, epistaxis, eructation, esophagospasm, euphoria, eye pain, fever, gastroesophageal reflux, hiccup, hot flushes, hyperacusis, hyperesthesia, hypertonia, hyperventilation, hypocalcemia, hypoglycemia, hypotonia, involuntary muscle contractions, laryngitis, leg cramps, malaise, micturition, muscle weakness, myalgia, nervousness, nocturia, peptic ulcer, personality disorder, pharyngitis, polyuria, pruritus, purpura, renal pain, rigors, saliva increased, salivary gland pain, seizure, speech disorder, stomatitis, syncope, tachycardia, taste perversion, thirst, tongue paralysis, toothache, tremor, unspecified pain, urinary frequency, vertigo, weakness

Metabolism/Transport Effects**Substrate** of CYP1A2 (minor)

Drug Interactions

Ergot Derivatives: May enhance the vasoconstricting effect of Serotonin 5-HT1D Receptor Agonists. Serotonin 5-HT1D Receptor Agonists may enhance the vasoconstricting effect of Ergot Derivatives. *Risk X: Avoid combination*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsFood: Food does not affect frovatriptan bioavailability.

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking (eg, ergot derivatives). Cardiovascular status should be evaluated prior to initiating medication and periodically thereafter. Assess effectiveness and adverse response. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationThis drug is to be used to reduce your migraine, not to prevent or reduce the number of attacks. Follow exact instructions for use. Do not take within 24 hours of any other migraine medication without first consulting prescriber. If first dose brings relief, a second dose may be taken anytime after 2 hours if migraine returns. Do not take more than three tablets (7.5 mg) in 24 hours without consulting prescriber. May cause dizziness, fatigue, insomnia, or drowsiness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); dry mouth (frequent mouth care and sucking on lozenges may help); skin flushing or hot flashes (cool clothes or a cool environment may help); or mild abdominal discomfort or vomiting (small frequent meals, good mouth care, chewing gum, or sucking lozenges may help). Report immediately any chest pain, palpitations, or irregular heartbeat; severe dizziness, acute headache, stiff or painful neck, facial swelling, muscle weakness or pain, changes in mental acuity, blurred vision, eye pain, or ringing in ears; changes in urinary pattern; respiratory difficulty; or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as base: 2.5 mg

Generic AvailableNo
ManufacturerEndo Pharmaceuticals
Pricing: U.S. (www.drugstore.com)

Tablets (Frova)

2.5 mg (9): $142.98

Mechanism of ActionSelective agonist for serotonin (5-HT_{1B} and 5-HT_{1D} receptor) in cranial arteries to cause vasoconstriction and reduces sterile inflammation associated with antidromic neuronal transmission correlating with relief of migraine.
Pharmacodynamics/Kinetics

Distribution: Male: 4.2 L/kg; Female: 3.0 L/kg

Protein binding: 15%

Metabolism: Primarily hepatic via CYP1A2

Bioavailability: 20% to 30%

Half-life elimination: 26 hours

Time to peak: 2-4 hours

Excretion: Feces (62%); urine (32%)

Related Information

- Antimigraine Drugs: 5-HT1 Receptor Agonists

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Cardiovascular ConsiderationsCoronary vasospasm has been associated with 5-$HT_{1B/1D}$ agonists. These agents are contraindicated in patients with documented ischemic or vasospastic coronary artery disease. Patients with risk factors for CAD may receive these agents, provided a cardiovascular evaluation yields satisfactory evidence that the patient is free of cardiovascular disease. In patients with risk factors for CAD, administration of the initial dose in a medically staffed/equipped facility (ie, physician's office) is recommended. In addition, ECG monitoring after the initial dose should be considered. Patients who acquire risk factors for CAD, or long-term users of agents from this class of medications, should undergo periodic cardiovascular evaluation.

Medication Safety Issues

Sound-alike/look-alike issues:

Emetrol® may be confused with emetine

Pronunciation(FRUK tose, DEKS trose, & foss FOR ik AS id)
U.S. Brand NamesEmetrol® [OTC]; Especol® [OTC]; Formula EM [OTC]; Kalmz [OTC]; Nausea Relief [OTC]; Nausetrol® [OTC]
Pharmacologic CategoryAntiemetic
Use: Labeled IndicationsRelief of nausea associated with upset stomach that occurs with intestinal or stomach flu, and food indiscretions
Dosing: Adults**Nausea:** Oral: 15-30 mL; repeat dose every 15 minutes until distress subsides; do not take for more than 1 hour (5 doses)
Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Nausea:** Oral

Children 2-12 years: 5-10 mL; repeat dose every 15 minutes until distress subsides; do not take for more than 1 hour (5 doses)

Children ≥12 years: Refer to adult dosing.

Administration: OralMay chill or drink after pouring over ice to improve taste. Should not be diluted or followed with other fluids immediately before or after administration.
ContraindicationsHypersensitivity to any component of the formulation; hereditary fructose intolerance
Warnings/Precautions

Disease-related concerns:

- Diabetes: Not for self-medication (OTC use) in patients with diabetes.

Other warnings/precautions:

- Lack of improvement: Contact healthcare provider if nausea continues or recurs frequently.

Drug InteractionsThere are no known significant interactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Liquid, oral: Fructose 1.87 g, dextrose 1.87 g, and phosphoric acid 21.5 mg per 5 mL (120 mL)

Emetrol®: Fructose 1.87 g, dextrose 1.87 g, and phosphoric acid 21.5 mg per 5 mL (120 mL, 240 mL) [cherry and lemon mint flavors]

Especol®: Fructose 1.87 g, dextrose 1.87 g, and phosphoric acid 21.5 mg per 5 mL (120 mL) [cherry and lemon-lime flavors]

Formula EM, Nausea Relief: Fructose 1.87 g, dextrose 1.87 g, and phosphoric acid 21.5 mg per 5 mL (120 mL)

Kalmz, Nausetrol®: Fructose 1.87 g, dextrose 1.87 g, and phosphoric acid 21.5 mg per 5 mL (120 mL) [cherry flavor]

Generic AvailableYes

Pharmacologic Category[Chemotherapy Regimen, Colorectal Cancer]

Regimen UseColorectal cancer

Index TermsFluorouracil-Leucovorin-Irinotecan; Irinotecan-Fluorouracil-Leucovorin

RegimenNOTE: Multiple variations are listed below.

Variation 1:

Irinotecan: I.V.: 350 mg/m^2 day 1

[total dose/cycle = 350 mg/m^2]

Leucovorin: I.V.: 20 mg/m^2/day days 22 to 26

[total dose/cycle = 100 mg/m^2]

Fluorouracil: I.V.: 425 mg/m^2/day days 22 to 26

[total dose/cycle = 2125 mg/m^2]

Repeat cycle every 6 weeks

Variation 2:

Irinotecan: I.V.: 80 mg/m^2 day 1

[total dose/cycle = 80 mg/m^2]

Fluorouracil: I.V.: 2300 mg/m^2 continuous infusion day 1

[total dose/cycle = 2300 mg/m^2]

Leucovorin: I.V.: 500 mg/m^2 day 1

[total dose/cycle = 500 mg/m^2]

Repeat cycle weekly

or

Irinotecan: I.V.: 180 mg/m^2 day 1

[total dose/cycle = 180 mg/m^2]

Leucovorin: I.V.: 200 mg/m^2/day days 1 and 2

[total dose/cycle = 400 mg/m^2]

Fluorouracil: I.V.: 400 mg/m^2/day days 1 and 2

[total dose/cycle = 800 mg/m^2]

followed by I.V.: 600 mg/m^2/day continuous infusion days 1 and 2

[total dose/cycle = 1200 mg/m^2]

Repeat cycle every 2 weeks

Variation 3:

Irinotecan: I.V.: 175 mg/m^2 day 1

[total dose/cycle = 175 mg/m^2]

Leucovorin: I.V.: 250 mg/m^2 day 2

[total dose/cycle = 250 mg/m^2]

Fluorouracil: I.V.: 950 mg/m^2 day 2

[total dose/cycle = 950 mg/m^2]

or

Irinotecan: I.V.: 200 mg/m^2 day 1

[total dose/cycle = 200 mg/m^2]

Leucovorin: I.V.: 250 mg/m^2 day 2

[total dose/cycle = 250 mg/m^2]

Fluorouracil: I.V.: 850 mg/m^2 day 2

[total dose/cycle = 850 mg/m^2]

Repeat cycle every other week

Fulvestrant

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(fool VES trant)
U.S. Brand NamesFaslodex®
Pharmacologic Category[Antineoplastic Agent, Estrogen Receptor Antagonist]
Use: Labeled IndicationsTreatment of hormone receptor positive metastatic breast cancer in postmenopausal women with disease progression following antiestrogen therapy
Use: Unlabeled/InvestigationalEndometriosis; uterine bleeding
Dosing: AdultsMetastatic breast cancer (postmenopausal women): I.M.: 250 mg at 1-month intervals
Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentNo dosage adjustment required.
Dosing: Hepatic ImpairmentUse in moderate-to-severe hepatic impairment has not been evaluated; use caution
Administration: I.M.I.M. injection into a relatively large muscle (ie, buttock); do not administer I.V., SubQ, or intra-arterially. May be administered as a single 5 mL injection or two concurrent 2.5 mL injections.
StorageStore under refrigeration at 2°C to 8°C (36°F to 46°F).
ContraindicationsHypersensitivity to fulvestrant or any component of the formulation; contraindications to I.M. injections (bleeding diatheses, thrombocytopenia, or therapeutic anticoagulation); pregnancy
Allergy Considerations

- Furantoin Allergy

Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; safety and efficacy have not been established in moderate-to-severe impairment.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorD
Pregnancy ConsiderationsAntiestrogenic compounds have been associated with embryotoxicity, abnormalities in fetal development, and failure to maintain pregnancy in animal models. Approved for use only in postmenopausal women.
LactationExcretion in breast milk unknown/contraindicated
Breast-Feeding ConsiderationsApproved for use only in postmenopausal women.
Adverse Reactions

>10%:

Cardiovascular: Vasodilation (18%)

Central nervous system: Pain (19%), headache (15%)

Endocrine & metabolic: Hot flushes (19% to 24%)

Gastrointestinal: Nausea (26%), vomiting (13%), constipation (13%), diarrhea (12%), abdominal pain (12%)

Local: Injection site reaction (11%)

Neuromuscular & skeletal: Weakness (23%), bone pain (16%), back pain (14%)

Respiratory: Pharyngitis (16%), dyspnea (15%)

1% to 10%:

Cardiovascular: Edema (9%), chest pain (7%)

Central nervous system: Dizziness (7%), insomnia (7%), paresthesia (6%), fever (6%), depression (6%), anxiety (5%)

Dermatologic: Rash (7%)

Gastrointestinal: Anorexia (9%), weight gain (1% to 2%)

Genitourinary: Pelvic pain (10%), urinary tract infection (6%), vaginitis (2% to 3%)

Hematologic: Anemia (5%)

Neuromuscular & skeletal: Arthritis (3%)

Respiratory: Cough (10%)

Miscellaneous: Diaphoresis increased (5%)

<1%: Angioedema, hypersensitivity reactions, leukopenia, myalgia, thrombosis, urticaria, vaginal bleeding, vertigo

Metabolism/Transport Effects**Substrate** of CYP3A4 (minor)

Drug InteractionsThere are no known significant interactions.

Nursing: Physical Assessment/MonitoringSee Administration for injection specifics. Assess therapeutic effectiveness and adverse response (eg, vasodilation, edema, gastrointestinal disturbances, dyspnea, pain) on a regular basis throughout therapy. Teach patient use (if self-administered - injection technique and syringe/needle disposal), possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. If self-administered, follow directions for injection and syringe/needle disposal. You may experience bone pain, back pain, or headache (consult prescriber for approved analgesic); nausea, vomiting, or loss of appetite (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); dizziness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or increased perspiration. Report persistent pain; chest pain or palpitations; swelling of extremities or unusual weight gain (>5 lb/week); cough of respiratory difficulty; burning on urination or changes in urinary pattern; or other persistent, unrelieved adverse effects. **Pregnancy/breast-feeding precautions**: Approved only for postmenopausal women. Severe fetal damage can occur with this drug. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution:

Faslodex®: 50 mg/mL (2.5 mL, 5 mL) [contains alcohol, benzyl alcohol, benzyl stearate, castor oil]

Generic AvailableNo

ManufacturerAstraZeneca (distributor); Vetter Pharma-Fertigung GMBH & Co (manufacturer)

Mechanism of ActionSteroidal compound which competitively binds to estrogen receptors on tumors and other tissue targets, producing a nuclear complex that decreases DNA synthesis and inhibits estrogen effects. Fulvestrant has no estrogen-receptor agonist activity. Causes down-regulation of estrogen receptors and inhibits tumor growth.

Pharmacodynamics/Kinetics

Duration: I.M.: Plasma levels maintained for at least 1 month

Distribution: V_d: 3-5 L/kg

Protein binding: 99%

Metabolism: Hepatic via multiple pathways (CYP3A4 substrate, relative contribution to metabolism unknown)

Bioavailability: Oral: Poor

Half-life elimination: ~40 days

Time to peak, plasma: I.M.: 7-9 days

Excretion: Feces (>90%); urine (<1%)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause depression, anxiety, insomnia, or dizziness

Mental Health: Effects on Psychiatric TreatmentGastrointestinal side effects are common, these effects may be additive with concurrent use of SSRIs, lithium, or valproate; rare reports of leukopenia; use caution with clozapine and carbamazepine; fluoxetine, fluvoxamine, and nefazodone may increase the serum levels and/or toxicity of fulvestrant; barbiturates and carbamazepine may decrease the therapeutic effect via increased metabolism

Furazolidone

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(fyoor a ZOE li done)

Canadian Brand NamesFuroxone®

Pharmacologic CategoryAntiprotozoal

Use: Labeled IndicationsTreatment of bacterial or protozoal diarrhea and enteritis caused by susceptible organisms *Giardia lamblia* and *Vibrio cholerae*

Dosing: AdultsDiarrhea/enteritis: Oral: 100 mg 4 times/day; not more than 8.8 mg/kg/day; treatment duration: 7 days

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricDiarrhea/enteritis: Oral: Children >1 month: 5-8 mg/kg/day in 4 divided doses for 7 days, not to exceed 400 mg/day or 8.8 mg/kg/day

Dietary ConsiderationsAvoid tyramine-containing foods/beverages. Some examples include aged or matured cheese, air-dried or cured meats (including sausages and salamis), fava or broad bean pods, tap/draft beers, Marmite concentrate, sauerkraut, and soy sauce and other soybean condiments.

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to furazolidone or any component of the formulation; concurrent use of ethanol; infants <1 month of age because of the possibility of producing hemolytic anemia; foods high in tyramine content

Allergy Considerations

- Furantoin Allergy

Warnings/Precautions

Special populations:

• G6PD deficiency: Use with caution in patients with G6PD deficiency when administering large doses for prolonged periods.

Other warnings/precautions:

• Monoamine oxidase: Inhibits monoamine oxidase.

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown

Adverse Reactions

>10%: Genitourinary: Discoloration of urine (dark yellow to brown)

1% to 10%:

Central nervous system: Headache

Gastrointestinal: Abdominal pain, diarrhea, nausea, vomiting

<1%: Agranulocytosis, arthralgia, disulfiram-like reaction after ethanol ingestion, dizziness, drowsiness, fever, hemolysis in patients with G6PD deficiency, hypoglycemia, leukopenia, malaise, orthostatic hypotension, rash

Drug Interactions

Alcohol (Ethyl): Furazolidone may enhance the adverse/toxic effect of Alcohol (Ethyl). A disulfiram-like reaction may occur. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): MAO Inhibitors may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Primarily with oral administration of phenylephrine. **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha-/Beta-Agonists (Indirect-Acting): MAO Inhibitors may enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

Alpha1-Agonists: MAO Inhibitors may enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Alpha2-Agonists (Ophthalmic): MAO Inhibitors may enhance the hypertensive effect of Alpha2-Agonists (Ophthalmic). *Risk X: Avoid combination*

Altretamine: May enhance the orthostatic effect of MAO Inhibitors. *Risk C: Monitor therapy*

Amphetamines: MAO Inhibitors may enhance the hypertensive effect of Amphetamines. *Risk X: Avoid combination*

Anilidopiperidine Opioids: May enhance the serotonergic effect of MAO Inhibitors. This could result in serotonin syndrome. Management: Avoid use of fentanyl (and other anilidopiperidine opioids when possible) in patients who have used a monoamine oxidase inhibitor within the past 14 days due to reports of unpredictable but severe adverse effects. *Risk D: Consider therapy modification*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): MAO Inhibitors may enhance the serotonergic effect of Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor). This may cause serotonin syndrome. *Risk X: Avoid combination*

Atomoxetine: MAO Inhibitors may enhance the neurotoxic (central) effect of Atomoxetine. *Risk X: Avoid combination*

Beta2-Agonists: MAO Inhibitors may enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

BuPROPion: MAO Inhibitors may enhance the neurotoxic (central) effect of BuPROPion. *Risk X: Avoid combination*

BusPIRone: May enhance the adverse/toxic effect of MAO Inhibitors. Elevated blood pressure has been reported. *Risk X: Avoid combination*

COMT Inhibitors: May enhance the adverse/toxic effect of MAO Inhibitors. *Risk D: Consider therapy modification*

Cyclobenzaprine: May enhance the serotonergic effect of MAO Inhibitors. This could result in serotonin syndrome. *Risk X: Avoid combination*

Dexmethylphenidate: MAO Inhibitors may enhance the hypertensive effect of Dexmethylphenidate. *Risk X: Avoid combination*

Dextromethorphan: MAO Inhibitors may enhance the serotonergic effect of Dextromethorphan. This may cause serotonin syndrome. *Risk X: Avoid combination*

Levodopa: May enhance the adverse/toxic effect of MAO Inhibitors. Of particular concern is the development of hypertensive reactions when levodopa is used with nonselective MAOI. *Risk D: Consider therapy modification*

Linezolid: MAO Inhibitors may enhance the adverse/toxic effect of Linezolid. *Risk X: Avoid combination*

Lithium: MAO Inhibitors may enhance the adverse/toxic effect of Lithium. *Risk C: Monitor therapy*

Maprotiline: May enhance the adverse/toxic effect of MAO Inhibitors. *Risk X: Avoid combination*

Meperidine: MAO Inhibitors may enhance the serotonergic effect of Meperidine. This may cause serotonin syndrome. *Risk X: Avoid combination*

Methyldopa: MAO Inhibitors may enhance the adverse/toxic effect of Methyldopa. *Risk X: Avoid combination*

Methylphenidate: MAO Inhibitors may enhance the hypertensive effect of Methylphenidate. *Risk X: Avoid combination*

Mirtazapine: MAO Inhibitors may enhance the neurotoxic (central) effect of Mirtazapine. *Risk X: Avoid combination*

Propoxyphene: May enhance the adverse/toxic effect of MAO Inhibitors. Specifically, the risk of serotonin syndrome or other serotonergic adverse events may be increased. *Risk X: Avoid combination*

Rauwolfia Alkaloids: MAO Inhibitors may enhance the adverse/toxic effect of Rauwolfia Alkaloids. Existing MAOI therapy can result in paradoxical effects of added rauwolfia alkaloids (eg, excitation, hypertension). *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: MAO Inhibitors may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk X: Avoid combination*

Serotonin 5-HT1D Receptor Agonists: MAO Inhibitors may decrease the metabolism of Serotonin 5-HT1D Receptor Agonists. Management: If MAO inhibitor therapy is required, naratriptan, eletriptan or frovatriptan may be a suitable 5-HT1D agonist to employ. **Exceptions:** Eletriptan; Frovatriptan; Naratriptan. *Risk X: Avoid combination*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Tetrabenazine: May enhance the adverse/toxic effect of MAO Inhibitors. *Risk X: Avoid combination*

TraMADol: May enhance the neuroexcitatory and/or seizure-potentiating effect of MAO Inhibitors. *Risk D: Consider therapy modification*

Tricyclic Antidepressants: MAO Inhibitors may enhance the serotonergic effect of Tricyclic Antidepressants. This may cause serotonin syndrome. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (a disulfiram-like reaction may occur).

Food: Concurrent ingestion of foods rich in tyramine may cause sudden and severe high blood pressure (hypertensive crisis). Avoid tyramine-containing foods with MAO-Is. Food's freshness is also an important concern; improperly stored or spoiled food can create an environment where tyramine concentrations may increase.

Herb/Nutraceuticals: Avoid supplements containing caffeine, tyrosine, tryptophan, or phenylalanine. Ingestion of large quantities may increase the risk of severe side effects (eg, hypertensive reactions, serotonin syndrome).

Test InteractionsFalse-positive results for urine glucose with Clinitest®

Monitoring ParametersCBC

Nursing: Physical Assessment/MonitoringMonitor other medications patient may be taking for effectiveness and interactions. Avoid use of Clinitest® for patients with diabetes. Monitor for adequate hydration. Assess/teach patient the importance of appropriate diet. Patient should be cautioned against eating foods high in tyramine. See Tyramine Content of Foods list.

Monitoring: Lab TestsPerform culture and sensitivity studies prior to initiating drug therapy.

Patient EducationTake as directed. Avoid tyramine-containing foods and beverages during and for 4 days following therapy. Do not take any other prescription or OTC medications without consulting prescriber. Your urine may turn dark brown or yellow (normal). If you have diabetes, use something other than Clinitest® for urine glucose testing. Report acute GI pain, unresolved diarrhea, unresolved nausea or vomiting, fever, dizziness, or unusual joint pain. Consult prescriber if condition is not resolved at the end of therapy. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Liquid:

Furoxone® [CAN]: 50 mg/15 mL [not available in the U.S.]

Tablet:

Furoxone® [CAN]: 100 mg [not available in the U.S.]

Generic AvailableNo

ManufacturerRoberts Pharmaceuticals

Mechanism of ActionInhibits several vital enzymatic reactions causing antibacterial and antiprotozoal action

Pharmacodynamics/Kinetics

Absorption: Poor

Excretion: Urine (33% as active drug and metabolites)

Related Information

- Tyramine Content of Foods

Pharmacotherapy PearlsNot available in U.S.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness or dizziness

Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine and carbamazepine; furazolidone inhibits MAO; caution with alcohol, anorexiants, antidepressants, meperidine, sympathomimetics, dopamine agonists, and tyramine-containing foods

Index TermsFuroxone

Medication Safety Issues

Sound-alike/look-alike issues:

Furosemide may be confused with torsemide

Lasix® may be confused with Esidrix®, Lanoxin®, Lidex®, Lomotil®, Luvox®, Luxiq®

International issues:

Urex® [Australia] may be confused with Eurax® which is a brand name for crotamiton in the U.S.

Urex® [Australia]: Brand name for methenamine in the U.S.

Pronunciation(fyoor OH se mide)

U.S. Brand NamesLasix®

Canadian Brand NamesApo-Furosemide®; Dom-Furosemide; Furosemide Injection, USP; Furosemide Special; Lasix®; Lasix® Special; Novo-Semide; Nu-Furosemide; PMS-Furosemide

Pharmacologic CategoryDiuretic, Loop

Use: Labeled IndicationsManagement of edema associated with congestive heart failure and hepatic or renal disease; alone or in combination with antihypertensives in treatment of hypertension

Dosing: Adults

Edema, CHF, or hypertension (diuresis):

Oral: 20-80 mg/dose initially increased in increments of 20-40 mg/dose at intervals of 6-8 hours; usual maintenance dose interval is twice daily or every day

Usual dosage range for hypertension (JNC 7): 20-80 mg/day in 2 divided doses

I.M., I.V.: 20-40 mg/dose, may be repeated in 1-2 hours as needed and increased by 20 mg/dose with each succeeding dose up to 1000 mg/day; usual dosing interval: 6-12 hours. **Note:** ACC/AHA 2005 guidelines for chronic congestive heart failure recommend a maximum single dose of 160-200 mg.

Continuous I.V. infusion: Initial I.V. bolus dose 20-40 mg, followed by continuous I.V. infusion doses of 10-40 mg/hour. If urine output is <1 mL/kg/hour, double as necessary to a maximum of 80-160 mg/hour. The risk associated with higher infusion rates (80-160 mg/hour) must be weighed against alternative strategies. **Note:** ACC/AHA 2005 guidelines for chronic congestive heart failure recommend 40 mg I.V. load, then 10-40 mg/hour infusion.

Refractory heart failure: Oral, I.V.: Doses up to 8 g/day have been used.

Dosing: ElderlyOral, I.M., I.V.: Initial: 20 mg/day; increase slowly to desired response.

Dosing: Pediatric

Edema, CHF, or hypertension (diuresis): Infants and Children:

Oral: 0.5-2 mg/kg/dose increased in increments of 1 mg/kg/dose with each succeeding dose until a satisfactory effect is achieved to a maximum of 6 mg/kg/dose no more frequently than 6 hours

I.M., I.V.: 1 mg/kg/dose, increasing by each succeeding dose at 1 mg/kg/dose at intervals of 6-12 hours until a satisfactory response up to 6 mg/kg/dose

Dosing: Renal Impairment

Acute renal failure: Doses up to 1-3 g/day may be necessary to initiate desired response; avoid use in oliguric states.

Not removed by hemo- or peritoneal dialysis; supplemental dose is not necessary.

Dosing: Hepatic ImpairmentDiminished natriuretic effect with increased sensitivity to hypokalemia and volume depletion in cirrhosis. Monitor effects, particularly with high doses.

Administration: I.V.I.V. injections should be given slowly. In adults, undiluted direct I.V. injections may be administered at a rate of 40 mg over 1-2 minutes; maximum rate of administration for IVPB or continuous infusion: 4 mg/minute. In children, a maximum rate of 0.5 mg/kg/minute has been recommended.

Administration: I.V. DetailAs a general guideline, I.V. bolus doses may be infused at a rate <20 mg/minute.

pH: 8-9.3

Administration: OralMay be taken with or without food.

Dietary ConsiderationsMay cause a potassium loss; potassium supplement or dietary changes may be required. Administer on an empty stomach. May be administered with food or milk if GI distress occurs. Do not mix with acidic solutions.

StorageFurosemide injection should be stored at controlled room temperature and protected from light. Exposure to light may cause discoloration. Do not use furosemide solutions if they have a yellow color. Refrigeration may result in precipitation or crystallization, however, resolubilization at room temperature or warming may be performed without affecting the drugs stability. I.V. infusion solution mixed in NS or D_5W solution is stable for 24 hours at room temperature.

ReconstitutionI.V. infusion solution may also be diluted for infusion 1-2 mg/mL (maximum: 10 mg/mL) over 10-15 minutes (following infusion rate parameters).

CompatibilityStable in D_5LR, D_5NS, D_5W, $D_{10}W$, $D_{20}W$, mannitol 20%, LR, NS.

Y-site administration: Compatible: Allopurinol, amifostine, amikacin, amphotericin B cholesteryl sulfate complex, aztreonam, bleomycin, cefepime, cisplatin, cladribine, cyclophosphamide, cytarabine, docetaxel, doxorubicin liposome, epinephrine, etoposide phosphate, fentanyl, fludarabine, fluorouracil, foscarnet, granisetron, heparin, hydrocortisone sodium succinate, hydromorphone, indomethacin, kanamycin, leucovorin, linezolid, lorazepam, melphalan, meropenem, methotrexate, mitomycin, nitroglycerin, norepinephrine, paclitaxel, piperacillin/tazobactam, potassium chloride, propofol, ranitidine, remifentanil, sargramostim, tacrolimus, teniposide, thiotepa, tobramycin, tolazoline, vitamin B complex with C. **Incompatible:** Alatrofloxacin, amsacrine, chlorpromazine, ciprofloxacin, clarithromycin, diltiazem, droperidol, esmolol, filgrastim, fluconazole, gatifloxacin, gemcitabine, gentamicin, hydralazine, idarubicin, levofloxacin, metoclopramide, midazolam, milrinone, netilmicin, nicardipine, ondansetron, quinidine gluconate, thiopental, vecuronium, vinblastine, vincristine, vinorelbine. **Variable (consult detailed reference):** Cisatracurium, dobutamine, dopamine, doxorubicin, famotidine, labetalol, meperidine, morphine.

Compatibility in syringe: Compatible: Bleomycin, cisplatin, cyclophosphamide, fluorouracil, heparin, leucovorin, methotrexate, mitomycin. **Incompatible:** Doxapram, doxorubicin, droperidol, metoclopramide, milrinone, vinblastine, vincristine.

Compatibility when admixed: Compatible: Amikacin, aminophylline, ampicillin, atropine, bumetanide, calcium gluconate, cefamandole, cefoperazone, cefuroxime, cimetidine, dexamethasone sodium phosphate, diamorphine, digoxin, epinephrine, heparin, isosorbide, kanamycin, lidocaine, meropenem, morphine, nitroglycerin, penicillin G, potassium chloride, ranitidine, scopolamine, sodium bicarbonate, sulfadimidine, theophylline, tobramycin. **Incompatible:** Buprenorphine, chlorpromazine, diazepam, dobutamine, erythromycin lactobionate, isoproterenol, meperidine, metoclopramide, netilmicin, prochlorperazine edisylate, promethazine. **Variable (consult detailed reference):** Amiodarone, gentamicin, hydrocortisone sodium succinate, verapamil.

ContraindicationsHypersensitivity to furosemide, any component, or sulfonylureas; anuria; patients with hepatic coma or in states of severe electrolyte depletion until the condition improves or is corrected

Allergy Considerations

- Loop Diuretic Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Fluid/electrolyte loss: Loop diuretics are potent diuretics; excess amounts can lead to profound diuresis with fluid and electrolyte loss; close medical supervision and dose evaluation are required. Watch for and correct electrolyte disturbances; adjust dose to avoid dehydration.
- Hyperuricemia: Asymptomatic hyperuricemia has been reported with use.
- Nephrotoxicity: Monitor fluid status and renal function in an attempt to prevent oliguria, azotemia, and reversible increases in BUN and creatinine; close medical supervision of aggressive diuresis required.
- Ototoxicity: Rapid I.V. administration, renal impairment, excessive doses, and concurrent use of other ototoxins is associated with ototoxicity.
- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonylurea allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.

Disease-related concerns:

- Cirrhosis: In cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.

Concurrent drug therapy issues:

- Antihypertensives: Coadministration of antihypertensives may increase the risk of hypotension.

Geriatric ConsiderationsLoop diuretics are potent diuretics; excess amounts can lead to profound diuresis with fluid and electrolyte loss; close medical supervision and dose evaluation is required, particularly in the elderly. Severe loss of sodium and/or increase in BUN can cause confusion. For any change in mental status in patients on furosemide, monitor electrolytes and renal function.

Pregnancy Risk FactorC

Pregnancy ConsiderationsCrosses the placenta. Increased fetal urine production, electrolyte disturbances reported. Generally, use of diuretics during pregnancy is avoided due to risk of decreased placental perfusion.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsCrosses into breast milk; may suppress lactation. AAP has NO RECOMMENDATION.

Adverse ReactionsFrequency not defined.

Cardiovascular: Acute hypotension, chronic aortitis, necrotizing angiitis, orthostatic hypotension, thrombophlebitis, sudden death from cardiac arrest (with I.V. or I.M. administration)

Central nervous system: Blurred vision, dizziness, fever, headache, lightheadedness, restlessness, vertigo, xanthopsia

Dermatologic: Cutaneous vasculitis, erythema multiforme, exfoliative dermatitis, photosensitivity, pruritus, purpura, rash, urticaria

Endocrine & metabolic: Gout, hyperglycemia, hyperuricemia, hypocalcemia, hypochloremia, hypokalemia, hypomagnesemia, hyponatremia, metabolic alkalosis

Gastrointestinal: Anorexia, constipation, cramping, diarrhea, intrahepatic cholestatic jaundice, ischemia hepatitis, nausea, oral and gastric irritation, pancreatitis, vomiting

Genitourinary: Urinary bladder spasm, urinary frequency

Hematological: Agranulocytosis (rare), anemia, aplastic anemia (rare), hemolytic anemia, leukopenia, purpura, thrombocytopenia

Neuromuscular & skeletal: Muscle spasm, paresthesia, weakness

Otic: Hearing impairment (reversible or permanent with rapid I.V. or I.M. administration), reversible deafness (with rapid I.V. or I.M. administration), tinnitus

Renal: Allergic interstitial nephritis, fall in glomerular filtration rate and renal blood flow (due to overdiuresis), glycosuria, transient rise in BUN, vasculitis

Miscellaneous: Anaphylaxis (rare), exacerbate or activate systemic lupus erythematosus

Oncology: VesicantNo
Oncology: Emetic PotentialVery low (<10%)
Drug Interactions

ACE Inhibitors: Loop Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Loop Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Aliskiren: May decrease the serum concentration of Furosemide. *Risk C: Monitor therapy*

Allopurinol: Loop Diuretics may enhance the adverse/toxic effect of Allopurinol. Loop Diuretics may increase the serum concentration of Allopurinol. Specifically, Loop Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Aminoglycosides: Loop Diuretics may enhance the adverse/toxic effect of Aminoglycosides. Specifically, nephrotoxicity and ototoxicity. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Loop Diuretics. *Risk D: Consider therapy modification*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Dofetilide: Loop Diuretics may enhance the QTc-prolonging effect of Dofetilide. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Neuromuscular-Blocking Agents: Loop Diuretics may diminish the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. Loop Diuretics may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the diuretic effect of Loop Diuretics. *Risk C: Monitor therapy*

Phenytoin: May diminish the diuretic effect of Loop Diuretics. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Food: Furosemide serum levels may be decreased if taken with food.

Herb/Nutraceutical: Avoid dong quai if using for hypertension (has estrogenic activity). Avoid ephedra, yohimbe, and ginseng (may worsen hypertension). Limit intake of natural licorice. Avoid garlic (may have increased antihypertensive effect).

Monitoring ParametersMonitor weight and I & O daily; blood pressure, orthostasis, serum electrolytes, renal function; in high doses, monitor hearing
Nursing: Physical Assessment/MonitoringAssess for allergy to sulfonylurea before beginning therapy. Assess potential for interactions with other pharmacological agents or herbal products patient may be taking (especially anything that may impact fluid balance, electrolyte balance, or increase potential for ototoxicity or hypotension). For intravenous use, see Administration specifics. Assess results of laboratory

tests (electrolytes), therapeutic effectiveness, and adverse response on a regular basis during therapy (eg, dehydration, electrolyte imbalance, postural hypotension). Caution patients with diabetes about closely monitoring glucose levels (glucose tolerance may be decreased). Teach patient appropriate use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsSerum electrolytes, renal function

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take as directed with food or milk (to reduce GI distress) early in the day (daily), or if twice daily, take last dose in late afternoon in order to avoid sleep disturbance and achieve maximum therapeutic effect. Keep medication in original container, away from light; do not use discolored medication. Follow dietary advice of prescriber; include bananas or orange juice or other potassium-rich foods in daily diet. Do not take potassium supplements without advice of prescriber. If you have diabetes, monitor glucose levels closely (this medication may alter glucose tolerance requiring an adjustment in the dose of hypoglycemic agent). Weigh yourself each day, at the same time, in the same clothes when beginning therapy and weekly on long-term therapy. Report unusual or unanticipated weight gain or loss. May cause dizziness, blurred vision, or drowsiness (use caution when driving or engaging in tasks that require alertness until response to drug is known); postural hypotension (use caution when rising from lying or sitting position or when climbing stairs); or sensitivity to sunlight (use sunblock or wear protective clothing and sunglasses). Report signs of edema (eg, weight gains; swollen ankles, feet, or hands), trembling, numbness or fatigue, cramping or muscle weakness, palpitations, unresolved nausea or vomiting, or change in hearing. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: 10 mg/mL (2 mL, 4 mL, 10 mL)

Injection, solution [preservative free]: 10 mg/mL (2 mL, 4 mL, 10 mL)

Solution, oral: 10 mg/mL (60 mL, 120 mL) [orange flavor]; 40 mg/5 mL (5 mL, 500 mL) [pineapple-peach flavor]

Tablet: 20 mg, 40 mg, 80 mg

Lasix®: 20 mg

Lasix®: 40 mg, 80 mg [scored]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Solution (Furosemide)

10 mg/mL (60): $16.99

10 mg/mL (120): $15.98

Tablets (Furosemide)

20 mg (100): $13.99

40 mg (100): $13.99

80 mg (30): $12.99

Tablets (Lasix)

20 mg (30): $20.60

40 mg (30): $23.86

80 mg (30): $30.37

Mechanism of ActionInhibits reabsorption of sodium and chloride in the ascending loop of Henle and distal renal tubule, interfering with the chloride-binding cotransport system, thus causing increased excretion of water, sodium, chloride, magnesium, and calcium

Pharmacodynamics/Kinetics

Onset of action: Diuresis: Oral: 30-60 minutes; I.M.: 30 minutes; I.V.: ~5 minutes

Peak effect: Oral: 1-2 hours

Duration: Oral: 6-8 hours; I.V.: 2 hours

Absorption: Oral: 60% to 67%

Protein binding: >98%

Metabolism: Minimally hepatic

Half-life elimination: Normal renal function: 0.5-1.1 hours; End-stage renal disease: 9 hours

Excretion: Urine (Oral: 50%, I.V.: 80%) within 24 hours; feces (as unchanged drug); nonrenal clearance prolonged in renal impairment

Related Information

- Heart Failure (Systolic)
- Hemodynamic Support, Intravenous
- Sulfonamide Derivatives

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness is common

Mental Health: Effects on Psychiatric TreatmentOrthostatic hypotension is common; use caution with low potency antipsychotics and TCAs; may rarely cause agranulocytosis; caution with clozapine and carbamazepine; may decrease renal clearance of lithium resulting in elevated serum levels and risk for toxicity; more common with thiazide diuretics; monitor lithium levels

Cardiovascular ConsiderationsIt is important that patients be closely followed for hypokalemia, hypomagnesemia, and volume depletion because of significant diuresis.

Anesthesia and Critical Care Concerns/Other ConsiderationsIt is important that patients be closely followed for hypokalemia, hypomagnesemia, and volume depletion because of significant diuresis. If given the morning of surgery, it may render the patient volume depleted and blood pressure may be labile during general anesthesia.

Jump To Field (Select Field Name)

Pronunciation(fyoo SI dik AS id)

Canadian Brand NamesFucidin®; Fucithalmic®

Pharmacologic CategoryAntibiotic, Miscellaneous

Use: Labeled Indications

Systemic: Treatment of skin and soft tissue infections, or osteomyelitis, caused by susceptible organisms, including *Staphylococcus aureus* (penicillinase-producing or nonpenicillinase strains); may be used in the treatment of pneumonia, septicemia, endocarditis, burns, and cystic fibrosis caused by susceptible organisms when other antibiotics have failed

Topical: Treatment of primary and secondary skin infections caused by susceptible organisms

Ophthalmic: Treatment of superficial infections of the eye and conjunctiva caused by susceptible organisms

Dosing: Adults

Susceptible infections: Oral, I.V.: 500 mg 3 times/day. (**Note:** Oral dosage may be increased to 1000 mg 3 times/day in fulminating infections.)

Superficial dermatologic infections: Topical: Apply to affected area 3-4 times/day until favorable results are achieved. If a gauze dressing is used, frequency of application may be reduced to 1-2 times/day.

Ophthalmic infections/conjunctivitis: Ophthalmic: Instill 1 drop in each eye every 12 hours for 7 days.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Susceptible infections: Children ≤12 years: I.V.: 20 mg/kg/day in 3 divided doses

Superficial dermatologic infections: Topical: Refer to adult dosing.

Ophthalmic infections/conjunctivitis: Ophthalmic: Children ≥2 years: Refer to adult dosing.

Dosing: Renal ImpairmentNo dosage adjustment required.

Dosing: Hepatic ImpairmentOral, I.V.: Use with extreme caution in patients with hepatic impairment, and monitor liver function periodically during therapy.

Administration: I.V.Should not be administered I.M. or SubQ. Intravenous administration should be via a large bore vein with good blood flow. Administer over 2 hours or more. Do not administer with whole blood or amino acid solutions.

Dietary ConsiderationsMay take tablets with food to minimize gastrointestinal upset.

Storage

Cream: Store below 25°C.

Injection, powder for reconstitution: Store below 25°C.

Ointment: Store below 30°C.

Ophthalmic suspension: Store at 2°C to 25°C. Discard multidose vials 1 month after opening.

ReconstitutionInjection, powder for reconstitution: Reconstitute 500 mg vial of powder for injection by adding 10 mL of supplied diluent containing phosphate/citrate buffer. Reconstituted solution may be further diluted with NS or D_5W; should be used within 24 hours. Add to NS or D_5W to produce a final concentration of 1-2 mg/mL. For patients weighing <50 kg, reconstituted drug should be diluted at least 10-fold in a compatible solution. Discard solution if opalescence is observed.

CompatibilityStable in NS, D_5W, or LR.

Incompatible with whole blood or amino acid solutions.

Compatibility when admixed: Incompatible with calcium solutions, carbenicillin, gentamicin, kanamycin.

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to fusidic acid or any component of the formulation

Warnings/Precautions

Disease-related concerns:

- Hepatic impairment: Use with extreme caution in hepatic impairment; monitor liver function regularly during treatment.

Dosage form specific issues:

- Phosphate/citrate buffer: Intravenous formulation contains phosphate/citrate buffer; excessive amounts may lead to hypocalcemia. Use with extreme caution in patients with pre-existing hypocalcemia.

Other warnings/precautions:

- Administration: Should not be administered I.M. or SubQ; local tissue injury may occur.

Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women. Fusidic acid crosses the placenta. Use only when potential benefit exceeds possible risk to the fetus. Excreted in breast milk; safety in breast-feeding women has not been established. May displace bilirubin from albumin in neonates or preterm babies.

LactationEnters breast milk/use caution

Adverse Reactions

Cardiovascular: Edema (leg), thrombophlebitis, venospasm

Central nervous system: Dizziness, headache, psychic disturbance

Dermatologic: Pruritus, rash

Gastrointestinal: Anorexia, dyspepsia, diarrhea, epigastric distress, nausea, vomiting

Hepatic: Jaundice

Local: Injection site reaction (redness, irritation)

Ocular: Blurred vision

Ophthalmic suspension: Ocular: Transient stinging, tearing, eyelid edema, temporary blurred vision

Drug Interactions

Penicillins: Fusidic Acid may diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Protease Inhibitors: May decrease the metabolism of Fusidic Acid. Fusidic Acid may decrease the metabolism of Protease Inhibitors. *Risk D: Consider therapy modification*

Monitoring ParametersMonitor liver function tests, including bilirubin periodically during systemic therapy

Monitoring: Lab TestsMonitor liver function tests, including bilirubin periodically during systemic therapy

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Cream, as fusidic acid:

Fucidin®: 2% (15 g, 30 g)

Injection, powder for reconstitution, as sodium fusidate:

Fucidin®: 500 mg [packaged with 10 mL diluent/buffer solution]

Ointment, topical, as sodium fusidate:

Fucidin®: 2% (15 g, 30 g) [contains lanolin]

Suspension, ophthalmic, as fusidic acid:

Fucithalmic®: 10 mg/g [1%] (0.2 g) [unit-dose, without preservative]; (3 g, 5 g) [multidose, contains benzalkonium chloride]

Tablet, as sodium fusidate:

Fucidin®: 250 mg

Generic AvailableNo

ManufacturerLeo Pharma (Canada)

Mechanism of ActionInhibits protein synthesis by blocking aminoacyl-sRNA transfer to protein in susceptible bacteria.

Pharmacodynamics/Kinetics

Protein binding: 97%

Metabolism: Hepatic, to multiple metabolites

Half-life elimination: 5-6 hours

Time to peak, serum: Oral: 2-4 hours

Excretion: Feces (~100%, via bile)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentNone reported

Special Alerts

Antiepileptics: Increased Risk of Suicidal Behavior or Ideation - Updated: December 2008

The U.S. Food and Drug Administration (FDA) has issued an update following the completion of its analysis concerning the risk of suicidality (suicidal behavior or ideation) observed during clinical trials of various antiepileptic drugs (compared to placebo) in the treatment of epilepsy, psychiatric disorders, and other conditions. The pooled analysis of 199 clinical trials involving 11 antiepileptic drugs (carbamazepine, divalproex sodium, felbamate, gabapentin, lamotrigine, levetiracetam, oxcarbazepine, pregabalin, tiagabine, topiramate, zonisamide) as either monotherapy or as adjuvant therapy showed that patients receiving an antiepileptic had a 0.43% risk of suicidal behavior/ideation compared to 0.24% of patients receiving placebo. As a result of the findings, the FDA will require that the product labeling of the entire class of antiepileptics include a warning concerning the risk of suicidality, and a medication guide be developed informing patients of this risk.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antiepileptic

Antiepileptics: Increased Risk of Suicidal Behavior or Ideation - February, 2008

The U.S. Food and Drug Administration (FDA) is informing healthcare professionals of an increased risk of suicidality (suicidal behavior or ideation) observed from analysis of clinical studies using various antiepileptic medications compared to placebo. The analysis was performed on 199 placebo-controlled studies involving 43,892 patients (27,863 treated patients versus 16,029 placebo patients) aged ≥5 years receiving one of the following 11 drugs: carbamazepine (Carbatrol®, Equetro™, Tegretol®, Tegretol® XR), felbamate (Felbatol®), gabapentin (Neurontin®), lamotrigine (Lamictal®), levetiracetam (Keppra®), oxcarbazepine (Trileptal®), pregabalin (Lyrica®), tiagabine (Gabitril®), topiramate (Topamax®), valproate (Depakote®, Depakote® ER, Depakene®, Depacon®), and zonisamide (Zonegran®). Studies examined medication efficacy in a variety of disorders, including epilepsy, psychiatric disorders (eg, depression, bipolar disorder), and other conditions (eg, migraine, neuropathic pain). According to the FDA, the results revealed a statistically significant increased risk of suicidality in 0.43% treated patients compared to 0.22% placebo patients, or an estimated 2.1 per 1000 (95% CI: 0.7, 4.2) more patients in the treated groups relative to placebo. This increased risk was reported anywhere from 1 week of therapy through 24 weeks. However, most trials were ≤24 weeks duration and the risk of suicide extending beyond 24 weeks is currently unknown. The relative risk of suicidal behavior or ideation in the treated patients was higher for patients with epilepsy (RR=3.6) compared to patients treated for psychiatric (RR=1.6) or other conditions (RR=2.3). Overall, the incidence of suicidal behavior or ideation occurred consistently across all demographic subgroups and with each of the drugs studied. Of note, four patients receiving an antiepileptic committed suicide relative to none in the placebo groups.

Forthcoming product labeling changes are likely to extend to all antiepileptic drugs and not limited to the drugs used in the studies, pending discussions scheduled for the upcoming advisory committee meeting. Healthcare professionals and family members/caregivers are encouraged to monitor patients receiving any antiepileptic medication for signs/symptoms of suicidality (eg, anxiety, depression, behavior changes). Patients should not stop taking their antiepileptic therapy unless advised by a healthcare professional.

Additional information can be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antiepileptic

Medication Safety Issues

Sound-alike/look-alike issues:

Neurontin® may be confused with Neoral®, Noroxin®

Pronunciation(GA ba pen tin)
U.S. Brand NamesNeurontin®
Canadian Brand NamesApo-Gabapentin®; BCI-Gabapentin; Gen-Gabapentin; Neurontin®; Novo-Gabapentin; Nu-Gabapentin; PMS-Gabapentin
Pharmacologic CategoryAnticonvulsant, Miscellaneous
Use: Labeled IndicationsAdjunct for treatment of partial seizures with and without secondary generalized seizures in patients >12 years of age with epilepsy; adjunct for treatment of partial seizures in pediatric patients 3-12 years of age; management of postherpetic neuralgia (PHN) in adults
Use: Unlabeled/InvestigationalSocial phobia; chronic pain
Use: DentalNeuropathic pain (consult with physician)
Dosing: Adults

Anticonvulsant: Oral:

Initial: 300 mg 3 times/day, if necessary the dose may be increased up to 1800 mg/day

Maintenance: 900-1800 mg/day administered in 3 divided doses; doses of up to 2400 mg/day have been tolerated in long-term clinical studies; up to 3600 mg/day has been tolerated in short-term studies

Note: If gabapentin is discontinued or if another anticonvulsant is added to therapy, it should be done slowly over a minimum of 1 week.

Chronic pain (unlabeled use): Oral: 300-1800 mg/day given in 3 divided doses has been the most common dosage range

Postoperative pain (unlabeled use): 300-1200 mg 1-2 hours before surgery

Postherpetic neuralgia: Day 1: 300 mg, Day 2: 300 mg twice daily, Day 3: 300 mg 3 times/day; dose may be titrated as needed for pain relief (range: 1800-3600 mg/day, daily doses >1800 mg do not generally show greater benefit)

Dosing: ElderlyStudies in elderly patients have shown a decrease in clearance as age increases. This is most likely due to age-related decreases in renal function; dose reductions may be needed.

Dosing: Pediatric

Anticonvulsant: Oral

Children 3-12 years: Initial: 10-15 mg/kg/day in 3 divided doses; titrate to effective dose over ~3 days; dosages of up to 50 mg/kg/day have been tolerated in clinical studies

Children 3-4 years: Effective dose: 40 mg/kg/day in 3 divided doses

Children 5-12 years: Effective dose: 25-35 mg/kg/day in 3 divided doses

Children >12 years: Refer to adult dosing.

Note: If gabapentin is discontinued or if another anticonvulsant is added to therapy, it should be done slowly over a minimum of 1 week

Dosing: Renal ImpairmentChildren ≥12 years and Adults: See table.

Hemodialysis: Dialyzable

Gabapentin Dosing Adjustments in Renal Impairment

Creatinine Clearance (mL/min)	**Daily Dose Range**
≥60	300-1200 mg tid
>30-59	200-700 mg bid
>15-29	200-700 mg daily
15[1]	100-300 mg daily
Hemodialysis[2]	125-350 mg
[1] Cl_{cr}<15 mL/minute: Reduce daily dose in proportion to creatinine clearance.	
[2] Single supplemental dose administered after each 4 hours of hemodialysis	

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralAdminister first dose on first day at bedtime to avoid somnolence and dizziness. Dosage must be adjusted for renal function; when given 3 times daily, the maximum time between doses should not exceed 12 hours.

Dietary ConsiderationsMay be taken without regard to meals.

StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).

Extemporaneously PreparedA 100 mg/mL suspension was stable for 91 days when refrigerated or 56 days when kept at room temperature when compounded as follows:

Triturate sixty-seven 300 mg tablets in a mortar, reduce to a fine powder, then add a small amount of one of the following vehicles to make a paste; then add the remaining vehicle in small quantities while mixing:

Vehicle 1. Methylcellulose 1% (100 mL) and Simple Syrup N.F. (100 mL) mixed together in a graduate, **or**

Vehicle 2. Ora-Sweet® (100 mL) and Ora-Plus® (100 mL) mixed together in a graduate

Shake well before using and keep in refrigerator

Nahata MC, Morosco RS, and Hipple TF, *Stability of Gabapentin in Extemporaneously Prepared Suspensions at Two Temperatures*, American Society of Health System Pharmacists Midyear Meeting, December 7-11, 1997.

ContraindicationsHypersensitivity to gabapentin or any component of the formulation

Allergy Considerations

- Gabapentin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Renal impairment: Use with caution in patients with severe renal impairment; dose adjustment required.

Concurrent drug therapy issues:

- Sedatives: Effects with other sedative drugs or ethanol may be potentiated.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <3 years of age. Children 3-12 years of age have shown increased incidence of CNS-related adverse effects, including emotional lability, hostility, thought disorder, and hyperkinesia.

Other warnings/precautions:

- Tumorigenic potential: Male rat studies demonstrated an association with pancreatic adenocarcinoma (clinical implication unknown).

- Withdrawal: Anticonvulsants should not be discontinued abruptly because of the possibility of increasing seizure frequency; therapy should be withdrawn gradually to minimize the potential of increased seizure frequency, unless safety concerns require a more rapid withdrawal.

Geriatric ConsiderationsStudies in the elderly have shown a decrease in clearance as age increases. This is most likely due to age-related decreases in renal function; calculations of Cl_{cr} recommended since dose reductions may be needed.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal studies have documented teratogenic effects. There are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if the potential benefit to the mother outweighs the potential risk to the fetus.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsGabapentin is excreted in human breast milk. A nursed infant could be exposed to ~1 mg/kg/day of gabapentin; the effect on the child is not known. Use in breast-feeding women only if the benefits to the mother outweigh the potential risk to the infant.

Adverse ReactionsAs reported in patients >12 years of age, unless otherwise noted in children (3-12 years)

>10%:

Central nervous system: Dizziness (17% to 28%; children 3%), somnolence (20%; children 8%), ataxia (13%), fatigue (11%)

Miscellaneous: Viral infection (children 11%)

1% to 10%:

Cardiovascular: Peripheral edema (2% to 8%), vasodilatation (1%)

Central nervous system: Fever (children 10%), hostility (children 8%), emotional lability (children 4%), fatigue (children 3%), headache (3%), ataxia (3%), abnormal thinking (2% to 3%; children 2%), amnesia (2%), depression (2%), dysarthria (2%), nervousness (2%), abnormal coordination (1% to 2%), twitching (1%), hyperesthesia (1%)

Dermatologic: Pruritus (1%), rash (1%)

Endocrine & metabolic: Hyperglycemia (1%)

Gastrointestinal: Diarrhea (6%), nausea/vomiting (3% to 4%; children 8%), abdominal pain (3%), weight gain (adults and children 2% to 3%), dyspepsia (2%), flatulence (2%), dry throat (2%), xerostomia (2% to 5%), constipation (2% to 4%), dental abnormalities (2%), appetite stimulation (1%)

Genitourinary: Impotence (2%)

Hematologic: Leukopenia (1%), WBC decreased (1%)

Neuromuscular & skeletal: Tremor (7%), weakness (6%), hyperkinesia (children 3%), abnormal gait (2%), back pain (2%), myalgia (2%), fracture (1%)

Ocular: Nystagmus (8%), diplopia (1% to 6%), blurred vision (3% to 4%), conjunctivitis (1%)

Otic: Otitis media (1%)

Respiratory: Rhinitis (4%), bronchitis (children 3%), respiratory infection (children 3%), pharyngitis (1% to 3%), cough (2%)

Miscellaneous: Infection (5%)

Postmarketing and additional clinical reports (limited to important or life-threatening): Acute renal failure, anemia, angina, angioedema, aphasia, arrhythmias (various), aspiration pneumonia, blindness, bradycardia, bronchospasm, cerebrovascular accident, CNS tumors, coagulation defect, colitis, Cushingoid appearance, dyspnea, encephalopathy, facial paralysis, fecal incontinence, glaucoma, glycosuria, heart block, hearing loss, hematemesis, hematuria, hemiplegia, hemorrhage, hepatitis, hepatomegaly, hyper-/hypotension, hyperlipidemia, hyper-/hypothyroidism, hyper-/hypoventilation, gastroenteritis, heart failure, leukocytosis, liver function tests increased, local myoclonus, lymphadenopathy, lymphocytosis, meningismus, MI, migraine, nephrosis, nerve palsy, non-Hodgkin's lymphoma, ovarian failure, pulmonary thrombosis, pericardial rub, pulmonary embolus, pericardial effusion, pericarditis, pancreatitis, peptic ulcer, purpura, paresthesia, palpitation, peripheral vascular disorder, pneumonia, psychosis, renal stone, retinopathy, skin necrosis, status epilepticus, subdural hematoma, suicidal behavior/ideation, syncope, tachycardia, thrombocytopenia, thrombophlebitis

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Ketorolac: May diminish the therapeutic effect of Anticonvulsants. *Risk C: Monitor therapy*

Mefloquine: May diminish the therapeutic effect of Anticonvulsants. Mefloquine may decrease the serum concentration of Anticonvulsants. Management: Mefloquine is contraindicated in persons with a history of convulsions. If anticonvulsant is being used for another indication monitor response to treatment closely, as concurrent mefloquine may decrease response to treatment. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Does not change rate or extent of absorption.

Herb/Nutraceutical: Avoid evening primrose (seizure threshold decreased). Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Test InteractionsFalse positives have been reported with the Ames N-Multistix SG® dipstick test for urine protein

Monitoring ParametersMonitor serum levels of concomitant anticonvulsant therapy

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor therapeutic effectiveness, laboratory values, and adverse reactions at beginning of therapy and periodically with long-term use. Assess for CNS depression. Taper dosage slowly when discontinuing. Assess knowledge/teach patient safety and seizure precautions, appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsMonitor serum levels of concomitant anticonvulsant therapy. Routine monitoring of gabapentin levels is not mandatory.

Patient EducationTake exactly as directed; do not increase dose or frequency. It may take 2-3 weeks to achieve desired results; may cause physical and/or psychological dependence. If prescribed once-a-day, take dose at bedtime. If taking antacids, take at least 2 hours after antacids. Do not stop medication abruptly, may lead to increased seizure activity. Avoid alcohol, caffeine, and other prescription or OTC medications not approved by prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, lightheadedness, impaired coordination, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, or anorexia (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); constipation (increased exercise, fluids, fruit, or fiber may help); diarrhea (buttermilk, yogurt, or boiled milk may help); postural hypotension (use caution when climbing stairs or changing position from lying or sitting to standing); or decreased sexual function or libido (reversible). Report persistent CNS effects (nervousness, restlessness, insomnia, anxiety, excitation, headache, sedation, seizures, mania, abnormal thinking); suicidal ideation or depression; rash or skin irritation; muscle cramping, tremors, or change in gait; chest pain or palpitations; change in urinary pattern; or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 100 mg, 300 mg, 400 mg

Neurontin®: 100 mg, 300 mg, 400 mg

Mechanism of ActionGabapentin is structurally related to GABA. However, it does not bind to GABA_A or GABA_B receptors, and it does not appear to influence synthesis or uptake of GABA. High affinity gabapentin binding sites have been located throughout the brain; these sites correspond to the presence of voltage-gated calcium channels specifically possessing the alpha-2-delta-1 subunit. This channel appears to be located presynaptically, and may modulate the release of excitatory neurotransmitters which participate in epileptogenesis and nociception.

Pharmacodynamics/Kinetics

Absorption: 50% to 60% from proximal small bowel by L-amino transport system

Distribution: V_d: 0.6-0.8 L/kg

Protein binding: <3%

Bioavailability: Inversely proportional to dose due to saturable absorption:

900 mg/day: 60%

1200 mg/day: 47%

2400 mg/day: 34%

3600 mg/day: 33%

4800 mg/day: 27%

Half-life elimination: 5-7 hours; anuria 132 hours; during dialysis 3.8 hours

Excretion: Proportional to renal function; urine (as unchanged drug)

Related Information

- Anticonvulsants by Seizure Type
- Status Epilepticus

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation), dry throat, and dental abnormalities.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health CommentDouble-blind studies have failed to differentiate this drug from placebo when used as an adjunctive treatment for bipolar disorder. Gabapentin may be useful for some of the anxiety disorders.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(gad oh BEN ate dye MEG loo meen)

U.S. Brand NamesMultihance®; Multihance® Multipack™

Pharmacologic CategoryGadolinium-Containing Contrast Agent; Radiological/Contrast Media (Nonionic, High Osmolality); Radiological/Contrast Media, Paramagnetic Agent

Use: Labeled IndicationsContrast medium for magnetic resonance imaging (MRI) to visualize CNS lesions with abnormal vascularity in the brain, spine, and associated tissues

Dosing: Adults

CNS lesions: I.V.: 0.1 mmol/kg (0.2 mL/kg)

Dosing: ElderlyRefer to adult dosing. Monitor renal function.

Dosing: Renal ImpairmentUse caution; elimination half-life increases with decreased renal function, however, dose adjustment is not recommended.

Mild-to-moderate renal dysfunction: Use caution; extent of risk for NSF development is unknown

Severe renal dysfunction (GFR <30 mL/minute/1.73 m^2): Not recommended; consider alternatives to use

Hemodialysis: If administered to patients already receiving hemodialysis, consider prompt hemodialysis following exposure. Data has shown hemodialysis enhances gadolinium elimination with average gadolinium excretory rates of 78%, 96%, and 99% in the first, second, and third hemodialysis sessions, respectively.

Peritoneal dialysis: Likely to be less efficient at clearing gadolinium.

Dosing: Hepatic Impairment

Child-Pugh class B or C: Pharmacokinetics were not significantly altered.

Perioperative liver transplantation period or hepato-renal syndrome (with concomitant acute renal insufficiency, of any severity): Not recommended; consider alternatives to use.

Administration: I.V.Administer as rapid bolus injection. Flush line with NS 5 mL to ensure complete injection of medium.

Administration: I.V. DetailOsmolality: 1970 mOsmol/kg; ~7 times plasma osmolality (285 mOsmol/kg)

pH 6.5-7.5

StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F); do not freeze. Once open, discard pharmacy bulk package after 8 hours.

ContraindicationsHypersensitivity to gadobenate dimeglumine, gadolinium, or any component of the formulation

Warnings/Precautions

Boxed warnings:

- Nephrogenic systemic fibrosis (NSF): See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Arrhythmias: AV conduction changes and atrial/ventricular arrhythmias have been observed rarely with use; use with caution in patients with predisposing proarrhythmic conditions (metabolic or cardiac abnormalities, or concurrent drug therapy).
- Hypersensitivity reactions: Anaphylactic reactions have occurred rarely; monitor patients closely during and after infusion.
- Nephrogenic systemic fibrosis (NSF): **[U.S. Boxed Warning]: Gadolinium-based contrast agents (GBCAs) exposure may increase the risk for NSF** development in patients with acute or chronic severe renal insufficiency (GFR <30 mL/minute/1.73 m^2) or acute renal insufficiency, of any severity, due to hepatorenal syndrome or in patients during the perioperative liver transplantation period. Avoid use in those high risk patients unless use of GBCA enhanced imaging is essential for diagnostic purposes. NSF, a potentially fatal disease, affects the skin, muscle, and internal organs and can occur days to months after exposure. The potential risk of NSF development, if any, in patients with mild-to-moderate renal insufficiency or normal function is unknown; all patients should be screened for renal dysfunction prior to administration. Additional risk factors may include repeated exposure and exceeding dosage recommendations.

Disease-related concerns:

- Asthma/allergies: Use with caution in patients with history of asthma, allergy, drug reactions, or hypersensitivity disorders.

- Hemolytic/sickle cell anemia: Use in patients with sickle cell anemia, other hemoglobinopathies, or other hemolytic anemias has not been studied. Sickling, possibly leading to vaso-occlusive crisis, in sickle cell patients has been reported (rare, case reports) with use of hyperosmolar contrast solution; vaso-occlusion is believed to result form red blood cell dehydration following hyperosmolar contrast administration.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Metabolic disorders: Use with caution in patients with metabolic disorders such as Dubin Johnson syndrome.

- Renal impairment: Use with caution in patients with renal impairment; avoid use in severe impairment. Dose-dependent worsening of renal function or acute renal failure has occurred in patients with renal insufficiency, generally within 48 hours following adminstration.

- Seizure disorder: Use with caution in patients with a history of seizure disorder.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Magnetic resonance angiography (MRA): Safety and efficacy have not been established for use in MRA.

- Scan interpretation: Use caution when interpreting a contrast-enhanced scan in the absence of a companion unenhanced noncontrast MRI.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic effects and increased intrauterine deaths were observed in some but not all animal studies. There are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if clearly needed.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsThe manufacturer recommends discontinuing breast-feeding for 24 hours following administration.

Adverse Reactions

1% to 10%:

Central nervous system: Headache (2% to 6%), dizziness (4%)

Gastrointestinal: Taste perversion (3%), nausea (2%)

<1%: Abdominal pain, albuminuria, alkaline phosphatase increased, anaphylactic reaction, anemia, aphasia, arrhythmia, ALT increased, AST increased, atrial fibrillation, back pain, basophilia, bilirubinemia, bradycardia, chest pain, chills, cold feeling, constipation, cough, diaphoresis, dyspepsia, dyspnea, ear pain, ECG abnormality, eye disorder, facial edema, fecal incontinence, fever, GGT increased, glycosuria, hematuria, hemiplegia, hemolysis, hyper-/hypoglycemia, hyperkalemia, hyperlipemia, hypertonia, hyperventilation, hypocalcemia, hypoesthesia, hyponatremia, hypoproteinemia, hypotension, infection, injection site inflammation, injection site pain, laryngismus, LDH increased, leukocytosis, leukopenia, lung edema, malaise, myalgia, myocardial ischemia, myositis, necrotizing pancreatitis (acute), pain, palpitation, paralysis, parosmia, peripheral edema, pruritus, pulmonary edema (acute), pulmonary embolus, rhinitis, salivation increased, seizure, serum iron increased, stupor, supraventricular extrasystoles, syncope, thirst, tinnitus, tremor, urinary frequency/urgency, urinary incontinence, urinary tract infection, urticaria, ventricular arrhythmia, ventricular extrasystoles, vision abnormal, weakness, xerostomia

Postmarketing and/or case reports: Anaphylactic shock, loss of consciousness, nephrogenic systemic fibrosis/nephrogenic fibrosing dermopathy (NSF/NFD; reported with another gadolinium-containing contrast agent)

Drug Interactions

Aldesleukin: Contrast Media (Non-ionic) may enhance the potential for allergic or hypersensitivity reactions to Aldesleukin. *Risk C: Monitor therapy*

Test InteractionsMay cause transient increase in serum ferritin, urine zinc (with renal disease), or bilirubin (with hepatic metabolic disorders)

Monitoring ParametersSigns of hypersensitivity (during and for several hours after procedure); renal function (prior to administration); short- and long-term monitoring of signs and symptoms of NSF (eg, burning, itching, swelling, hardening and/or tightening of skin, joint stiffness, deep hip or rib bone pain, muscle weakness, limited range of motion, and/or yellowed/raised spots on whites of eye)

Nursing: Physical Assessment/MonitoringEvaluate patient for contraindications prior to treatment (high risk of nephrogenic systemic fibrosis in patients with acute or chronic renal insufficiency). Assess other pharmacological or herbal products patient may be taking for potential interactions. See specific Administration instructions. Teach possible side effects/appropriate interventions and adverse symptoms to report.

Patient EducationThis product may only be administered by intravenous infusion. You may experience unusual taste, mild nausea, dizziness or headache. Report immediately any burning, pain, or swelling at infusion site or any acute headache or gastrointestinal effects, swelling, burning, itching or discoloration of skin, or unusual bone pain or pain in joints.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

Multihance®: 529 mg/mL (5 mL, 10 mL, 15 mL, 20 mL)

Multihance® Multipack™: 529 mg/mL (50 mL, 100 mL) [pharmacy bulk package]

Generic AvailableNo

ManufacturerBracco Diagnostics

Mechanism of ActionGadobenate dimeglumine is a gadolinium-containing paramagnetic agent. Exposure to an external magnetic field induces a large local magnetic field in exposed tissues. This local magnetism disrupts water protons in the vicinity, resulting in a change in proton density and spin characteristics, which can be detected by the imaging device.

Pharmacodynamics/Kinetics

Distribution: V_d: 0.15-0.36 L/kg; does not cross intact blood brain barrier; distribution half-life: 0.072-0.68 hours

Half-life elimination:

Normal renal function: 0.9-2.6 hours

Cl_{cr} 30-60 mL/minute: 3-9 hours

Cl_{cr} 10-30 mL/minute: 6-12 hours

End-stage renal disease (without dialysis): 18-67 hours

Excretion: Urine (78% to 96%); feces

Pharmacotherapy PearlsContrast agents are generally classified as high-osmolar (≥1400 mOsm/kg), low-osmolar (780-800 mOsm/kg), or iso-osmolar (~300 mOsm/kg) relative to plasma osmolarity (~285 mOsmol/kg).

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsGadolinum-BOPTA; Gd-BOPTA

Medication Safety Issues

Sound-alike/look-alike issues:

Gadovist® may be confused with Magnevist®, Vasovist™

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(gad oh BYOO trol)

Canadian Brand NamesGadovist®

Pharmacologic CategoryGadolinium-Containing Contrast Agent; Radiological/Contrast Media (Nonionic, High Osmolality); Radiological/Contrast Media, Paramagnetic Agent

Use: Labeled IndicationsContrast medium for magnetic resonance imaging (MRI) of CNS lesions (brain, spine, and associated tissues); perfusion studies to diagnose stroke, or to detect focal cerebral ischemia or tumor perfusion; contrast-enhanced magnetic resonance angiography (CE-MRA)

Dosing: Adults

General CNS imaging: I.V.: 0.1 mmol/kg (0.1 mL/kg); if needed, a second dose of 0.1-0.2 mmol/kg (0.1-0.2 mL/kg) may be repeated once within 30 minutes of the first dose

Exclusion of metastatic or recurrent tumors: I.V.: 0. 3 mmol/kg (0.3 mL/kg)

Perfusion studies: I.V.: 0. 3 mmol/kg (0.3 mL/kg)

CE-MRA: I.V.:

- Imaging of a single field of view (FOV):
  - Patient weight <75 kg: 7.5 mL
  - Patient weight ≥75 kg: 10 mL
- Imaging >1 FOV:
  - Patient weight <75 kg: 15 mL
  - Patient weight ≥75 kg: 20 mL

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentUse caution; reduce dosing with renal impairment; no specific guideline available from manufacturer. With severe renal impairment, manufacturer recommends at least 3 hemodialysis sessions within 5 days of the administration of gadobutrol.

Dosing: Hepatic ImpairmentNo specific guideline available from manufacturer; however, based on exclusive renal excretion of gadobutrol, dose adjustment in hepatic impairment is likely unnecessary.

Administration: I.V.Administer as intravenous bolus injection only. Extravascular administration may result in tissue damage and pain. Flush line with NS to ensure complete injection of medium. Imaging should be completed within 45 minutes of injection.

Administration: I.V. DetailOsmolality: 1603 mOsmol/kg water

pH: 6.6-8

StorageStore at 15°C to 30°C (59°F to 86°F); protect from freezing.

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to gadobutrol, gadolinium, or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Hypersensitivity reactions: Hypersensitivity, including anaphylactic reactions (rare), may occur; appropriate equipment (eg, ventilator) and emergency medications (eg, epinephrine) should be available during use. Delayed reactions may also occur (hours-to-days following administration of contrast media). Patients with a history of allergic reactions and/or bronchial asthma may be at an increased risk for developing hypersensitivity reactions; use caution in these patients.

- Nephrogenic systemic fibrosis (NSF): Gadolinium-based contrast agent (GBCA) exposure may increase the risk for NSF development in patients with acute or chronic severe renal insufficiency (GFR <30 mL/minute/1.73 m^2) or acute renal insufficiency, of any severity, due to hepatorenal syndrome or in patients during the perioperative liver transplantation period. Avoid use in those high risk patients unless use of GBCA enhanced imaging is essential for diagnostic purposes. NSF, a potentially fatal disease, affects the skin, muscle, and internal organs and can occur days to months after exposure. The potential risk of NSF development, if any, in patients with mild-to-moderate renal insufficiency or normal function is unknown; all patients should be screened for renal dysfunction prior to administration. Additional risk factors may include repeated exposure and exceeding dosage recommendations.

- QT prolongation: Gadobutrol may prolong the QT interval. Females may be more susceptible than males. Use caution in patients with prior history of QT prolongation, current proarrhythmic states, hypokalemia, and those receiving Class Ia (eg, quinidine) or Class III (eg, amiodarone) antiarrhythmics. Patients at risk for QT prolongation should be monitored for at least one hour after administration of gadobutrol.

Disease-related concerns:

- Seizure disorder: Use with caution in patients with a history of seizure disorder; may lower seizure threshold. Injectable anticonvulsant agents should be readily available.

- Sickle cell anemia: In *in vitro* studies, deoxygenated sickle erythrocytes align perpendicular to a magnetic field; the enhancement of magnetic moment by contrast agents may potentiate this alignment possibly resulting in vaso-occlusive complications *in vivo*. Use in patients with sickle cell anemia or other hemoglobinopathies has not been studied.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if clearly needed.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsThe manufacturer recommends discontinuing breast-feeding for 24 hours following administration and discarding milk for that period.

Adverse Reactions

1% to 10%:

Cardiovascular: Vasodilation (1%)

Central nervous system: Headache (1%), dizziness (up to 1%)

Gastrointestinal: Nausea (1%), diarrhea (up to 1%), dysgeusia (1%), vomiting (up to 1%)

Neuromuscular & skeletal: Paresthesia (up to 3%)

<1% and/or frequency not defined: Abdominal pain, allergic reaction, apathy, aphasia, convulsion, diaphoresis, dyspnea, fever, hot flashes, hypoesthesia, infection, injection site pain, insomnia, palpitation, parosmia, postural hypotension, rash, urinary urgency, vertigo, vision abnormal, xerostomia

Drug Interactions

Aldesleukin: Contrast Media (Non-ionic) may enhance the potential for allergic or hypersensitivity reactions to Aldesleukin. *Risk C: Monitor therapy*

QTc-Prolonging Agents: Gadobutrol may enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Monitoring ParametersRenal function; signs of hypersensitivity (during and for several hours after procedure); short- and long-term monitoring of signs and symptoms of NSF/NFD (eg, burning, itching, swelling, hardening and/or tightening of skin, joint stiffness, deep hip or rib bone pain, muscle weakness, limited range of motion, and/or yellowed/raised spots on whites of eye); EKG (if concerns of prior history of QT_c interval changes)

Nursing: Physical Assessment/MonitoringUse caution in the presence of renal impairment (dose reduction may be necessary), proarrhythmic states, history of QT prolongation, hypokalemia, sickle cell anemia, or history of seizures. Assess potential for interactions with other pharmacological agents patient may be taking (eg, drugs known to cause prolonged QT interval). Teach patient possible side effects and adverse symptoms to report.

Monitoring: Lab TestsRenal function

Patient EducationThis medication can only be administered by infusion; you will be closely monitored during treatment. Report immediately unusual pain, headache, nausea, vomiting, or other unusual reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant or breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Injection, solution [preservative free]:

Gadovist® [CAN]: 604.72 mg/mL (15 mL) [contains calcium sodium butrol 0.513 mg/mL and trometamol 1.211 mg/mL; not available in U.S.]

Generic AvailableNo

Manufacturer

Berlex Canada, Inc

Mechanism of ActionGadobutrol is a gadolinium-containing, nonionic paramagnetic agent. Exposure to an external magnetic field induces a large local magnetic field in exposed tissues. This local magnetism disrupts water protons in the vicinity, resulting in a change in proton density and spin characteristics, which can be detected by the imaging device.

Pharmacodynamics/Kinetics

Onset of action: ~15 minutes

Duration: ~45 minutes

Distribution: Rapid into extracellular space

Half-life elimination: Normal renal function: ~1.5 hours; severe renal dysfunction (Cl_{cr} <30 mL/minute: ~18-20 hours

Urine: (as unchanged drug); feces (negligible)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(gad oh DYE a mide)

U.S. Brand NamesOmniscan™

Pharmacologic CategoryGadolinium-Containing Contrast Agent; Radiological/Contrast Media (Nonionic, Low Osmolality); Radiological/Contrast Media, Paramagnetic Agent

Use: Labeled IndicationsContrast medium for magnetic resonance imaging (MRI) to visualize CNS lesions with abnormal vascularity in the brain, spine, and associated tissues, and to visualize body lesions with abnormal vascularity within the thoracic (noncardiac), abdominal, pelvic cavities, and retroperitoneal space

Dosing: Adults

Body imaging: I.V.:

Kidney: 0.05 mmol/kg (0.1 mL/kg); the safety of additional doses has not been studied

Intrathoracic (noncardiac), intra-abdominal, pelvic cavities: 0.1 mmol/kg (0.2 mL/kg); the safety of additional doses has not been studied

CNS imaging: 0.1 mmol/kg (0.2 mL/kg); if needed, a second dose of 0.2 mmol/kg (0.4 mL/kg) may be repeated once within 20 minutes of the first dose

Dosing: Elderly

Refer to adult dosing. Monitor renal function.

Dosing: Pediatric

Body imaging: Children ≥2 years: I.V.

Kidney: 0.05 mmol/kg (0.1 mL/kg); the safety of additional doses has not been studied

Intrathoracic (noncardiac), intra-abdominal, pelvic cavities: 0.1 mmol/kg (0.2 mL/kg)

CNS imaging: Children ≥2 years: I.V.: 0.1 mmol/kg (0.2 mL/kg); the safety of additional doses has not been studied

Dosing: Renal ImpairmentUse with caution; safety and efficacy have not been studied.

Mild-to-moderate renal dysfunction: Use caution; extent of risk for NSF development is unknown.

Severe renal dysfunction (GFR <30 mL/minute/1.73 m^2): Not recommended; consider alternatives to use.

Hemodialysis: If administered to patients already receiving hemodialysis, consider prompt hemodialysis following exposure. Data has been shown hemodialysis enhances gadolinium elimination with average gadolinium excretory rates of 78%, 96%, and 99% in the first, second, and third hemodialysis sessions, respectively.

Peritoneal dialysis: Likely to be less efficient at clearing gadolinium.

Dosing: Hepatic ImpairmentUse with caution; safety and efficacy have not been studied.

Perioperative liver transplantation period or hepatorenal syndrome (with concomitant acute renal insufficiency, of any severity): Not recommended; consider alternatives to use.

Administration: I.V.**For I.V. use only; not for intrathecal use.**Administer as bolus injection. Flush line with NS 5 mL to ensure complete injection of medium. Imaging should be completed within 60 minutes of injection.

Administration: I.V. DetailOsmolality: 789 mOsmol/kg water; ~3 times plasma osmolality (285 mOsmol/kg)

pH: 5.5-7

StorageStore at room temperature of 15°C to 30°C (59°F to 86°F); protect from light. Do not freeze; do not use if inadvertently frozen.

ContraindicationsThere are no contraindications listed in manufacturer's labeling.

Warnings/Precautions

Boxed warnings:

- Nephrogenic systemic fibrosis (NSF): See “Concerns related to adverse effects” below.
- Not for intrathecal use: See “Other warnings/precautions” below.

Concerns related to adverse effects:

- Hypersensitivity reactions: Anaphylactic reactions have occurred rarely; monitor patients closely during and after infusion.
- Nephrogenic systemic fibrosis (NSF): **[U.S. Boxed Warning]: Gadolinium-based contrast agents (GBCAs) exposure may increase the risk for NSF** development in patients with acute or chronic severe renal insufficiency (GFR <30 mL/minute/1.73 m^2) or acute renal insufficiency, of any severity, due to hepatorenal syndrome or in patients during the perioperative liver transplantation period. Avoid use in those high risk patients unless use of GBCA enhanced imaging is essential for diagnostic purposes. NSF, a potentially fatal disease, affects the skin, muscle, and internal organs and can occur days to months after exposure. The potential risk of NSF development, if any, in patients with mild-to-moderate renal insufficiency or normal function is unknown; all patients should be screened for renal dysfunction prior to administration. Additional risk factors may include repeated exposure and exceeding dosage recommendations.

Disease-related concerns:

- Asthma/allergies: Use with caution in patients with history of asthma, allergy, drug reactions, or hypersensitivity disorders.
- Hemolytic/sickle cell anemia: Use in patients with sickle cell anemia, other hemoglobinopathies, or other hemolytic anemias has not been studied. Sickling, possibly leading to vaso-occlusive crisis, in sickle cell patients has been reported (rare, case reports) with use of hyperosmolar contrast solution; vaso-occlusion is believed to result form red blood cell dehydration following hyperosmolar contrast administration.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Renal impairment: Use with caution in patients with renal impairment; avoid use in severe impairment. Dose-dependent worsening of renal function or acute renal failure has occurred in patients with renal insufficiency, generally within 48 hours following adminstration.
- Seizure disorder: Use with caution in patients with a history of seizure disorder.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <2 years of age.

Other warnings/precautions:

- Magnetic resonance angiography (MRA): Safety and efficacy have not been established for use in MRA.
- Not for intrathecal use: For I.V. use only. **[U.S. Boxed Warning]: Convulsions, coma, and sensory/motor neurologic deficits have occurred with inadvertent intrathecal administration.**
- Repeat dosing: Safety of repeat dosing has only been studied in adults for CNS studies. If repeat dosing is needed in children or non-CNS adult studies, and patient has normal renal function, an interval of at least 7 hours is suggested to allow normal clearance of drug from the body.
- Scan interpretation: Use caution when interpreting a contrast-enhanced scan in the absence of a companion unenhanced noncontrast MRI.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic effects were observed in some but not all animal studies and may partially be due to maternal toxicity. There are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if clearly needed.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

1% to 10%:

Central nervous system: Dizziness (≤3%), headache (≤3%)

Gastrointestinal: Nausea (≤3%)

<1%: Abdominal pain, anaphylactoid reactions, anorexia, anxiety, arrhythmias, arthralgia, ataxia, cardiac failure, chest pain, coordination abnormal, diaphoresis, diarrhea, dyspnea, eructation, erythematous rash, fatigue, fever, flushing, hepatic dysfunction, hot flushes, injection site reaction, malaise, melena, MI, migraine, MS (aggravated), myalgia, pain, paresthesia, personality disorder, pruritus, rash, renal dysfunction (acute/reversible), rhinitis, rigors, seizure, skin discoloration, somnolence, syncope, taste loss, taste perversion, thrombophlebitis, tinnitus, tremor, urticaria, vasodilation, vision abnormal, vomiting, weakness, xerostomia

Postmarketing and/or case reports: Nephrogenic systemic fibrosis/nephrogenic fibrosing dermopathy (NSF/NFD)

Drug Interactions

Aldesleukin: Contrast Media (Non-ionic) may enhance the potential for allergic or hypersensitivity reactions to Aldesleukin. *Risk C: Monitor therapy*

Test InteractionsTransitory changes in serum iron have been observed. May interfere with colorimetric tests for serum calcium (apparent decrease); alternate testing method is recommended for 12-24 hours after administration.

Monitoring ParametersSigns of hypersensitivity (during and for several hours after procedure); renal function (prior to administration); short- and long-term monitoring of signs and symptoms of NSF (eg, burning, itching, swelling, hardening and/or tightening of skin, joint stiffness, deep hip or rib bone pain, muscle weakness, limited range of motion, and/or yellowed/raised spots on whites of eye)

Nursing: Physical Assessment/MonitoringSee specific Administration instructions. Teach possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationThis product may only be administered by intravenous infusion. You may experience mild nausea, dizziness, or headache. Report immediately any burning, pain, or swelling at infusion site or any acute headache or gastrointestinal effects, swelling, burning, itching or discoloration of skin, or unusual bone pain or pain in joints.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

Omniscan™: 287 mg/mL (5 mL, 10 mL, 15 mL, 20 mL, 50 mL) [contains caldiamide sodium 12 mg/mL; some packaging may contain natural latex/natural rubber]

Generic AvailableNo

ManufacturerAmersham Health

Mechanism of ActionGadodiamide is a gadolinium-containing paramagnetic agent. Exposure to an external magnetic field induces a large local magnetic field in exposed tissues. This local magnetism disrupts water protons in the vicinity, resulting in a change in proton density and spin characteristics, which can be detected by the imaging device.

Pharmacodynamics/Kinetics

Distribution: V_d: 139-261 mL/kg; does not cross intact blood-brain barrier; distribution half-life: 1-6 minutes

Half-life elimination: 62-94 minutes

Excretion: Urine (~95%)

Pharmacotherapy PearlsContrast agents are generally classified as high-osmolar (≥1400 mOsm/kg), low-osmolar (780-800 mOsm/kg), or iso-osmolar (~300 mOsm/kg) relative to plasma osmolarity (~285 mOsmol/kg).

Medication Safety Issues

Sound-alike/look-alike issues:

Vasovist® may be confused with Magnevist®, Gadovist®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(gad oh FOS ve set)

Canadian Brand NamesVasovist®

Pharmacologic CategoryGadolinium-Containing Contrast Agent; Radiological/Contrast Media (Nonionic, Low Osmolality); Radiological/Contrast Media, Paramagnetic Agent

Use: Labeled IndicationsContrast medium used to enhance visualization of abdominal or limb vasculature in magnetic resonance angiography (MRA)

Dosing: Adults

MRA: I.V.: 0.03 mmol/kg (0.12 mL/kg); doses >0.03 mmol/kg are not recommended

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentManufacturer suggests use with caution in renal impairment, however no dosage adjustment is recommended.

Dosing: Hepatic ImpairmentNo dosage adjustment necessary for Child-Pugh class A and B. Use caution for Child-Pugh class C; no dosing recommendations provided with approved labeling.

Administration: I.V.Administer as an intravenous bolus injection at a rate not exceeding 1.5 mL/sec through a dedicated I.V. line separate from other medications. Flush line with 25-30 mL NS after administration to ensure complete injection of medium. Imaging should be completed within 1 hour of injection.

Administration: I.V. DetailOsmolality: 825 mOsmol/kg water

pH: 5.4-6.9

StorageStore at 15°C to 30°C (59°F to 86°F). Protect from light.

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to gadofosveset, gadolinium, or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Hypersensitivity reactions: Hypersensitivity, including anaphylactic reactions (rare), may occur; appropriate equipment (eg, ventilator) and emergency medications (eg, epinephrine) should be available during use. Delayed reactions may also occur (hours-to-days following administration of contrast media). Patients with a history of allergic reactions and/or bronchial asthma may be at an increased risk for developing hypersensitivity reactions; use caution in these patients.

- Nephrogenic systemic fibrosis (NSF): Gadolinium-based contrast agent (GBCA) exposure may increase the risk for NSF development in patients with acute or chronic severe renal insufficiency (GFR <30 mL/minute/1.73 m^2) or acute renal insufficiency, of any severity, due to hepatorenal syndrome or in patients during the perioperative liver transplantation period. Avoid use in those high risk patients unless use of GBCA enhanced imaging is essential for diagnostic purposes. NSF, a potentially fatal disease, affects the skin, muscle, and internal organs and can occur days to months after exposure. The potential risk of NSF development, if any, in patients with mild-to-moderate renal insufficiency or normal function is unknown; all patients should be screened for renal dysfunction prior to administration. Additional risk factors may include repeated exposure and exceeding dosage recommendations.

- QT_c prolongation: Rare cases of QT_c prolongation have been observed with gadofosveset use. Prolongation of the QT interval can increase the risk of torsade de pointes. Female and elderly patients may be more susceptible to torsade de pointes. Manufacturer states to use caution in patients with prior history of QT_c prolongation, current proarrhythmic states, electrolyte imbalances, and those receiving drugs whose use may be associated with QT_c interval prolongation. However, data from pooled safety studies demonstrated that the administration of gadofosveset resulted in minimal changes to the QT_c interval as compared to placebo (means of 2.8 msec and 3.2 msec respectively). Patients should be monitored for at least 1 hour after the administration of gadofosveset.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment.

- Hypoalbuminemia: Elimination of gadofosveset may be quicker in patients with decreased levels of serum albumin.

Concurrent drug therapy issues:

- Contrast agents: Safety and efficacy have not been studied for the use of gadofosveset in conjunction with other contrast agents (eg, iodine-containing, gadolinium based). Use caution in patients who have received iodine-containing agents within 72 hours or other gadolinium-based agents within 24 hours prior to gadofosveset administration.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if clearly needed.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsThe manufacturer recommends discontinuing breast-feeding for 24 hours following administration and discarding milk for that period.

Adverse Reactions

1% to 10% (observed with 0.03 mmol/kg dose):

Cardiovascular: QT_c prolongation (up to 7%; placebo up to 9%), vasodilatation (3%)

Central nervous system: Headache (2%)

Dermatologic: Pruritus (4%)

Gastrointestinal: Nausea (4%), taste disturbance (2%)

Neuromuscular & skeletal: Paresthesia (3%)

Miscellaneous: Burning sensation (2%), cold feeling (1%)

<1%, postmarketing, and/or case reports (limited to important or life-threatening; observed in clinical studies using doses 0.005-0.10 mmol/kg): Anaphylactoid reaction, anemia, anxiety, arteriosclerosis, atrial fibrillation, AV block (first degree), bradycardia, chest pain, creatine phosphokinase increased, diaphoresis, diarrhea, dizziness, dyspnea, erythema, extravasation, glycosuria, hallucination, hematocrit decreased, hematuria, hemoglobin decreased, hyperglycemia, hypersensitivity, hyper-/hypotension, hypoalbuminemia, hypocalcemia, injection site pain, injection site thrombosis, lactate dehydrogenase increased, leukocytosis, microalbuminuria, muscle cramps, muscle spasms, myocardial ischemia, palpitation, phlebitis, polyuria, pyrexia, QT_c prolongation (>60 msec), respiratory depression, rigors, serum creatinine increased, tachycardia, thrombocytopenia, TIBC decreased, transaminases increased, tremor, urticaria, vomiting, weakness, xerostomia

Drug Interactions

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Monitoring ParametersBaseline ECG if risk factors for QT_c prolongation/torsade de pointes; baseline electrolytes (including potassium, calcium and magnesium); renal function; signs of hypersensitivity (during and for several hours after procedure); short- and long-term monitoring of signs and symptoms of NSF/NFD (eg, burning, itching, swelling, hardening and/or tightening of skin, joint stiffness, deep hip or rib bone pain, muscle weakness, limited range of motion, and/or yellowed/raised spots on whites of eye); patients should be monitored for at least 1 hour after administration of gadofosveset.

Nursing: Physical Assessment/MonitoringUse caution in the presence of severe renal impairment (dose reduction may be necessary), history of QT prolongation, hypersensitivity disorders, or asthma. Assess potential for interactions with other pharmacological or biological agents patient may be taking (eg, drugs known to cause prolonged QT interval). Teach patient possible side effects and adverse symptoms to report.

Monitoring: Lab TestsBaseline electrolytes (including potassium, calcium and magnesium), renal function

Patient EducationThis medication can only be administered by infusion; you will be closely monitored during treatment. Report immediately unusual pain, headache, nausea or vomiting, or other unusual reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant or breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Injection, solution [preservative free]:

Vasovist® [CAN]: 0.25 mmoL/mL (10 mL, 15 mL, 20 mL) [not available in U.S.]

Generic AvailableNo

ManufacturerBayer Canada Inc

Mechanism of ActionGadofosveset is a gadolinium-containing paramagnetic agent that reversibly binds to albumin in the plasma. Exposure to an external magnetic field induces a large local magnetic field in exposed blood vessels. This local magnetism disrupts water protons in the vicinity, resulting in a change in proton density and spin characteristics, which can be detected by the imaging device. The binding of gadofosveset to albumin prolongs the period of time gadofosveset resides intravascularly, enhances T1 relaxivity up to 10 times greater than nonprotein bound gadolinium chelates and provides a longer imaging window.

Pharmacodynamics/Kinetics

Onset of action: ~15 minutes

Duration: ~1 hour

Distribution: V_{dss}: 0.132-0.164 L/kg

Protein binding: 75% to 96% to albumin

Metabolism: Negligible

Half-life elimination: ~16 hours; increases with moderate-to-severe renal impairment (Cl_{cr} <50 mL/minute)

Excretion: Urine (84% as unchanged drug); feces (~5%)

Index TermsGadofosveset Trisodium

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(gad oh PEN te tate dye MEG loo meen)

U.S. Brand NamesMagnevist®

Canadian Brand NamesMagnevist®

Pharmacologic CategoryGadolinium-Containing Contrast Agent; Radiological/Contrast Media (Ionic, High Osmolality); Radiological/Contrast Media, Paramagnetic Agent

Use: Labeled IndicationsContrast medium for magnetic resonance imaging (MRI) to visualize lesions with abnormal vascularity in the brain, spine and associated tissues, head and neck, and body (excluding the heart)

Dosing: AdultsMRI: I.V.: 0.1 mmol/kg (0.2 mL/kg)

Note: Dosing for patients >130 kg (286 pounds) has not been studied.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricMRI: I.V.: Children ≥2 years: Refer to adult dosing.

Dosing: Renal ImpairmentUse with caution.

Mild-to-moderate renal dysfunction: Use caution; extent of risk for NSF development is unknown.

Severe renal dysfunction (GFR <30 mL/minute/1.73 m^2): Not recommended; consider alternatives to use.

Hemodialysis: If administered to patients already receiving hemodialysis, consider prompt hemodialysis following exposure. Data has been shown hemodialysis enhances gadolinium elimination with average gadolinium excretory rates of 78%, 96%, and 99% in the first, second, and third hemodialysis sessions, respectively.

Peritoneal dialysis: Likely to be less efficient at clearing gadolinium.

Dosing: Hepatic ImpairmentUse with caution.

Perioperative liver transplantation period or hepatorenal syndrome (with concomitant acute renal insufficiency, of any severity): Not recommended; consider alternatives to use.

Administration: I.V.Dose should be administered at a rate not to exceed 10 mL per 15 seconds. Complete imaging procedure within 1 hour of injection. Following administration, flush line with NS 5 mL.

Administration: I.V. DetailOsmolality: 1960 mOsmol/kg water; ~7 times plasma osmolality (285 mOsmol/kg)

pH: 6.5-8.0

StorageStore at room temperature of 15°C to 30°C (59°F to 86°F); do not freeze. Protect from light. If freezing does occur in the vial, place at room temperature for a minimum of 90 minutes. Ensure return to clear particulate-free solution prior to use.

ContraindicationsThere are no contraindications listed in manufacturer's labeling.

Warnings/Precautions

Boxed warnings:

- Nephrogenic systemic fibrosis (NSF): See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Hypersensitivity reactions: Anaphylactic reactions have occurred rarely; monitor patients closely during and after infusion.

- Nephrogenic systemic fibrosis (NSF): **[U.S. Boxed Warning]: Gadolinium-based contrast agents (GBCAs) exposure may increase the risk for NSF** development in patients with acute or chronic severe renal insufficiency (GFR <30 mL/minute/1.73 m^2) or acute renal insufficiency, of any severity, due to hepatorenal syndrome or in patients during the perioperative liver transplantation period. Avoid use in those high risk patients unless use of GBCA enhanced imaging is essential for diagnostic purposes. NSF, a potentially fatal disease, affects the skin, muscle, and internal organs and can occur days to months after exposure. The potential risk of NSF development, if any, in patients with mild-to-moderate renal insufficiency or normal function is unknown; all patients should be screened for renal dysfunction prior to administration. Additional risk factors may include repeated exposure and exceeding dosage recommendations.

Disease-related concerns:

- Asthma/allergies: Use with caution in patients with history of asthma, allergy, drug reactions, or hypersensitivity disorders.

- Hemolytic/sickle cell anemia: Use in patients with sickle cell anemia, other hemoglobinopathies, or other hemolytic anemias has not been studied. Sickling, possibly leading to vaso-occlusive crisis, in sickle cell patients has been reported (rare, case reports) with use of hyperosmolar contrast solution; vaso-occlusion is believed to result form red blood cell dehydration following hyperosmolar contrast administration.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Renal impairment: Use with caution in patients with renal impairment; avoid use in severe impairment. Dose-dependent worsening of renal function or acute renal failure has occurred in patients with renal insufficiency, generally within 48 hours following adminstration.

- Seizure disorder: Use with caution in patients with a history of seizure disorder.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <2 years of age.

Other warnings/precautions:

- Injection site reactions: Site of contrast injection or limb may develop thrombosis with fasciitis, skin and soft tissue necrosis, and/or compartment syndrome requiring surgical intervention (rare); assess line patency prior to administration.

- Magnetic resonance angiography (MRA): Safety and efficacy have not been established for use in MRA.

- Repeat doses: Safety of repeat doses has not been studied.

- Scan interpretation: Use caution when interpreting a contrast-enhanced scan in the absence of a companion unenhanced noncontrast MRI.

Pregnancy Risk FactorC
Pregnancy ConsiderationsRetarded fetal development was noted in animal studies; congenital anomalies in animals have not been reported. There are no adequate and well-controlled studies in pregnant women.
LactationEnters breast milk/use caution
Breast-Feeding ConsiderationsFollowing administration of gadopentetate dimeglumine 0.1 mmol/kg, <0.04% gadolinium was excreted in breast milk within 24 hours. In an average 70 kg woman, this would be equivalent to <3 micromol of gadolinium transferred to a breast-feeding infant. The duration of excretion into breast milk and the possible effects to the infant are not known.
Adverse Reactions

1% to 10%:

Central nervous system: Headache (5%), dizziness (1%)

Gastrointestinal: Nausea (3%)

Local: Injection site coldness/localized coldness (2%)

<1%: Abdominal pain, agitation, anaphylactoid reaction, angina, anorexia, anxiety, arrhythmia, back pain, chest tightness, coldness (generalized), compartment syndrome, conjunctivitis, constipation, convulsions, cough, deep vein thrombophlebitis, diaphoresis, diarrhea, diplopia, drowsiness, dyspnea, ear pain, ECG changes (nonspecific), edema (local), epidermal necrolysis, erythema multiforme, eye irritation, eye pain, facial edema, fever, gastrointestinal distress, hypertension, hypotension; injection site reactions (burning, localized warmth, pain); lacrimation disorder, laryngismus, lymphangitis (regional), MI, migraine; nystagmus, pallor, paresthesia, pelvic pain, phlebitis, pruritus, pustules, rash, respiratory complaints, rhinorrhea, salivation increased, shivering, sneezing, stomach pain, stupor, substernal chest pain, syncope, tachycardia, taste abnormality, teeth pain, tension in extremities, thirst, throat irritation, thrombophlebitis, tinnitus, tiredness, trembling, urticaria, vasodilation, visual field defect, vomiting, warmth (generalized), weakness, wheezing, xerostomia

Postmarketing and/or case reports: Nephrogenic systemic fibrosis/nephrogenic fibrosing dermopathy (NSF/NFD)

Drug InteractionsThere are no known significant interactions.
Test InteractionsTransitory changes in serum iron, bilirubin, and transaminase levels have been observed
Monitoring ParametersPatient and injection site should be monitored for signs of hypersensitivity for several hours following injection; renal function (prior to administration); short- and long-term monitoring of signs and symptoms of NSF (eg, burning, itching, swelling, hardening and/or tightening of skin, joint stiffness, deep hip or rib bone pain, muscle weakness, limited range of motion, and/or yellowed/raised spots on whites of eye)
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

Magnevist®: Gadopentetate dimeglumine 469.01 mg/mL (5 mL, 10 mL, 15 mL, 20 mL, 50 mL, 100 mL)

Generic AvailableNo
ManufacturerBerlex Imaging
Mechanism of ActionExposure to an external magnetic field induces a large local magnetic field in gadopentetate exposed tissues. This local magnetism disrupts water protons in the vicinity, resulting in a change in proton density and spin characteristics, which can be detected by the imaging device.
Pharmacodynamics/Kinetics

Distribution: V_d: 223-309 mL/kg; does not cross intact blood-brain barrier; distribution half-life: 4-20 minutes

Half-life elimination: 1.5-1.7 hours

Excretion: Urine (~91% as gadopentetate)

Pharmacotherapy Pearls Contrast agents are generally classified as high-osmolar (≥1400 mOsm/kg), low-osmolar (780-800 mOsm/kg), or iso-osmolar (~300 mOsm/kg) relative to plasma osmolarity (~285 mOsmol/kg).

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status May cause dizziness; may rarely cause agitation, anxiety, or sedation

Mental Health: Effects on Psychiatric Treatment None reported

Index Terms Gadolinium-DTPA; Gd-DTPA

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(gad oh TER i dol)

U.S. Brand NamesProHance®

Pharmacologic CategoryGadolinium-Containing Contrast Agent; Radiological/Contrast Media (Nonionic, Low Osmolality); Radiological/Contrast Media, Paramagnetic Agent

Use: Labeled IndicationsContrast medium for magnetic resonance imaging (MRI) to visualize CNS lesions with abnormal vascularity in the brain, spine, and associated tissues and to visualize extracranial/extraspinal tissues in the head and neck

Dosing: Adults

CNS imaging: I.V.: 0.1 mmol/kg (0.2 mL/kg); if needed, a second dose of 0.2 mmol/kg (0.4 mL/kg) may be repeated once within 30 minutes of the first dose

Extracranial/extraspinal tissue: I.V.: 0.1 mmol/kg (0.2 mL/kg)

Dosing: PediatricCNS imaging: I.V.: Children ≥2 years: 0.1 mmol/kg (0.2 mL/kg); the safety of additional doses has not been studied

Dosing: Renal ImpairmentUse with caution; safety and efficacy have not been studied.

Mild-to-moderate renal dysfunction: Use caution; extent of risk for NSF development is unknown.

Severe renal dysfunction (GFR <30 mL/minute/1.73 m^2): Not recommended; consider alternatives to use.

Hemodialysis: If administered to patients already receiving hemodialysis, consider prompt hemodialysis following exposure. Data has been shown hemodialysis enhances gadolinium elimination with average gadolinium excretory rates of 78%, 96%, and 99% in the first, second, and third hemodialysis sessions, respectively.

Peritoneal dialysis: Likely to be less efficient at clearing gadolinium.

Dosing: Hepatic ImpairmentUse with caution; safety and efficacy have not been studied.

Perioperative liver transplantation period or hepatorenal syndrome (with concomitant acute renal insufficiency, of any severity): Not recommended; consider alternatives to use.

Administration: I.V.Administer as a rapid infusion (10-60 mL/minute) or as a bolus (>60 mL/minute). Flush line with NS 5 mL to ensure complete injection of medium. Imaging should be completed within 60 minutes of injection.

Administration: I.V. DetailOsmolality: 630 mOsmol/kg water; ~2 times plasma osmolality (285 mOsmol/kg)

pH: 6.5-8

StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F); protect from light, do not freeze. If frozen, bring to room temperature for ≥60 minutes before use. Solution should be clear and colorless or slightly yellow. Discard any syringes that freeze; discard vials containing solids that do not redissolve. Once open, discard pharmacy bulk package after 8 hours.

ContraindicationsThere are no contraindications listed in manufacturer's labeling.

Warnings/Precautions

Boxed warnings:

- Nephrogenic systemic fibrosis (NSF): See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Hypersensitivity reactions: Anaphylactic reactions have occurred rarely; monitor patients closely during and after infusion.

- Nephrogenic systemic fibrosis (NSF): **[U.S. Boxed Warning]: Gadolinium-based contrast agents (GBCAs) exposure may increase the risk for NSF** development in patients with acute or chronic severe renal insufficiency (GFR <30 mL/minute/1.73 m^2) or acute renal insufficiency, of any severity, due to hepatorenal syndrome or in patients during the perioperative liver transplantation period. Avoid use in those high risk patients unless use of GBCA enhanced imaging is essential for diagnostic purposes. NSF, a potentially fatal disease, affects the skin, muscle, and internal organs and can occur days to months after exposure. The potential risk of NSF development, if any, in patients with mild-to-moderate renal insufficiency or normal function is unknown; all patients should be screened for renal dysfunction prior to administration. Additional risk factors may include repeated exposure and exceeding dosage recommendations.

Disease-related concerns:

- Asthma/allergies: Use with caution in patients with history of asthma, allergy, drug reactions, or hypersensitivity disorders.

- Hemolytic/sickle cell anemia: Use in patients with sickle cell anemia, other hemoglobinopathies, or other hemolytic anemias has not been studied. Sickling, possibly leading to vaso-occlusive crisis, in sickle cell patients has been reported (rare, case reports) with use of hyperosmolar contrast solution; vaso-occlusion is believed to result form red blood cell dehydration following hyperosmolar contrast administration.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Renal impairment: Use with caution in patients with renal impairment; avoid use in severe impairment. Dose-dependent worsening of renal function or acute renal failure has occurred in patients with renal insufficiency, generally within 48 hours following adminstration.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(gad oh ver SET a mide)

U.S. Brand NamesOptiMARK®

Pharmacologic CategoryGadolinium-Containing Contrast Agent; Radiological/Contrast Media (Nonionic, High Osmolality); Radiological/Contrast Media, Paramagnetic Agent

Use: Labeled IndicationsContrast medium for magnetic resonance imaging (MRI) to visualize lesions with abnormal vascularity in the liver or CNS (brain, spine, and associated tissues)

Dosing: Adults**CNS or liver lesions**: I.V.: 0.1 mmol/kg (0.2 mL/kg)

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentUse with caution; elimination half-life increases with decreased renal function.

Mild-to-moderate renal dysfunction: Use caution; extent of risk for NSF development is unknown.

Severe renal dysfunction (GFR <30 mL/minute/1.73 m^2): Not recommended; consider alternatives to use.

Hemodialysis: If administered to patients already receiving hemodialysis, consider prompt hemodialysis following exposure. Data has been shown hemodialysis enhances gadolinium elimination with average gadolinium excretory rates of 78%, 96%, and 99% in the first, second, and third hemodialysis sessions, respectively.

Peritoneal dialysis: Likely to be less efficient at clearing gadolinium.

Dosing: Hepatic ImpairmentPharmacokinetics were not significantly altered.

Perioperative liver transplantation period or hepatorenal syndrome (with concomitant acute renal insufficiency, of any severity): Not recommended; consider alternatives to use.

Administration: I.V.Administer as rapid bolus injection over 1-2 mL/second. Flush line with NS 5 mL to ensure complete injection of medium. Imaging should be completed within 60 minutes of injection.

Administration: I.V. DetailOsmolality: 1110 mOsmol/kg water; ~4 times plasma osmolality (285 mOsmol/kg)

pH: 5.5-7.5

StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F); protect from light; do not freeze. Once open, discard pharmacy bulk package after 4 hours.

ContraindicationsHypersensitivity to gadolinium, versetamide, or any component of the formulation

Warnings/Precautions

Boxed warnings:

- Nephrogenic systemic fibrosis (NSF): See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Hypersensitivity reactions: Anaphylactic reactions have occurred rarely; monitor patients closely during and after infusion.
- Nephrogenic systemic fibrosis (NSF): **[U.S. Boxed Warning]: Gadolinium-based contrast agents (GBCAs) exposure may increase the risk for NSF** development in patients with acute or chronic severe renal insufficiency (GFR <30 mL/minute/1.73 m^2) or acute renal insufficiency, of any severity, due to hepatorenal syndrome or in patients during the perioperative liver transplantation period. Avoid use in those high risk patients unless use of GBCA enhanced imaging is essential for diagnostic purposes. NSF, a potentially fatal disease, affects the skin, muscle, and internal organs and can occur days to months after exposure. The potential risk of NSF development, if any, in patients with mild-to-moderate renal insufficiency or normal function is unknown; all patients should be screened for renal dysfunction prior to administration. Additional risk factors may include repeated exposure and exceeding dosage recommendations.

Disease-related concerns:

- Asthma/allergies: Use with caution in patients with history of asthma, allergy, drug reactions, or hypersensitivity disorders.
- Hemolytic/sickle cell anemia: Use in patients with sickle cell anemia, other hemoglobinopathies, or other hemolytic anemias has not been studied. Sickling, possibly leading to vaso-occlusive crisis, in sickle cell patients has been reported (rare, case reports) with use of hyperosmolar contrast solution; vaso-occlusion is believed to result form red blood cell dehydration following hyperosmolar contrast administration.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Renal impairment: Use with caution in patients with renal impairment; avoid use in severe impairment. Dose-dependent worsening of renal function or acute renal failure has occurred in patients with renal insufficiency, generally within 48 hours following adminstration.

- Seizure disorder: Use with caution in patients with a history of seizure disorder.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Magnetic resonance angiography (MRA): Safety and efficacy have not been established for use in MRA.

- Repeat doses: Safety of repeat doses has not been studied.

- Scan interpretation: Use caution when interpreting a contrast-enhanced scan in the absence of a companion unenhanced noncontrast MRI.

Pregnancy Risk FactorC
Pregnancy ConsiderationsDecreased neonatal weight and cardiac abnormalities were observed in animal studies. There are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if clearly needed.
LactationExcretion in breast milk unknown/not recommended
Breast-Feeding ConsiderationsThe manufacturer recommends discontinuing breast-feeding and discard breast milk for 72 hours following administration.
Adverse Reactions

1% to 10%:

Cardiovascular: Vasodilation (6%), QT_c prolongation (≥61 msec, 3%)

Central nervous system: Headache (9%), dizziness (4%), pain (1%)

Gastrointestinal: Taste perversion (6%), nausea (3%), abdominal pain (2%), diarrhea (2%), dyspepsia (1%)

Local: Injection site reaction (2%)

Neuromuscular & skeletal: Paresthesia (2%), weakness (2%), back pain (1%)

Respiratory: Rhinitis (2%)

<1%: Agitation, allergic reaction, amblyopia, anorexia, anxiety, appetite increased, arrhythmia, arthralgia, asthma, chest pain, confusion, conjunctivitis, constipation, cough, creatinine increased, depersonalization, diaphoresis, diplopia, dry skin, dysphagia, dyspnea, dystonia, dysuria, edema, epistaxis, eructation, erythema multiforme, facial edema, fever, flatulence, flu-like syndrome, hallucinations, hemoptysis, hyperacusis, hypercalcemia, hyper-/hypoglycemia, hyper-/hypotension, hypertonia, hypoesthesia, hyponatremia, injection site edema, injection site reactions, laryngismus, leg cramps, malaise, mucous membrane discharge, myalgia, myasthenia, neck pain, neck rigidity, nervousness, oliguria, palpitation, pallor, parosmia, pelvic pain, pharyngitis, pruritus, rash (maculopapular and vesiculous bullous), salivation increased, sinusitis, somnolence, spasm, syncope, tachycardia, thirst, thrombocytopenia, thrombophlebitis, tinnitus, tremor, urinary frequency, urticaria, vasospasm, vertigo, voice alteration, vomiting, xerostomia

Postmarketing and/or case reports: Nephrogenic systemic fibrosis/nephrogenic fibrosing dermopathy (NSF/NFD), seizure

Drug Interactions

Aldesleukin: Contrast Media (Non-ionic) may enhance the potential for allergic or hypersensitivity reactions to Aldesleukin. *Risk C: Monitor therapy*

Test InteractionsMay cause transient changes in serum iron, copper or zinc. May interfere with colorimetric tests for serum calcium (apparent decrease); alternate testing method is recommended for 12-24 hours after administration.
Monitoring ParametersSigns of hypersensitivity (during and for several hours after procedure); renal function (prior to administration); short- and long-term monitoring of signs and symptoms of NSF (eg, burning, itching, swelling, hardening and/or tightening of skin, joint stiffness, deep hip or rib bone pain, muscle weakness, limited range of motion, and/or yellowed/raised spots on whites of eye)
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

OptiMARK®: 330.9 mg/mL (5 mL, 10 mL, 15 mL, 20 mL, 30 mL, 50 mL) [contains versetamide sodium 28.4 mg/mL and calcium chloride dihydrate 0.7 mg/mL]

Generic AvailableNo
ManufacturerMallinckrodt
Mechanism of ActionGadoversetamide is a paramagnetic agent formed by the chelation of gadolinium and versetamide. Exposure to an external magnetic field induces a large local magnetic field in exposed tissues. This local magnetism disrupts water protons in the vicinity, resulting in a change in proton density and spin characteristics, which can be detected by the imaging device.
Pharmacodynamics/Kinetics

Distribution: V_d: 137-187 mL/kg; does not cross intact blood brain barrier; distribution half-life: 6.5-20 minutes

Half-life elimination: 84-123 minutes

Excretion: Urine (~96%)

Pharmacotherapy Pearls Contrast agents are generally classified as high-osmolar (≥1400 mOsm/kg), low-osmolar (780-800 mOsm/kg), or iso-osmolar (~300 mOsm/kg) relative to plasma osmolarity (~285 mOsmol/kg).

Mental Health: Effects on Mental Status None reported

Mental Health: Effects on Psychiatric Treatment None reported

Index Terms Gadolinium-DTPA-BMEA; Gd-DTPA-BMEA

Medication Safety Issues

Sound-alike/look-alike issues:

Razedyne™ may be confused with Rozerem™

Reminyl® may be confused with Amaryl®

Due to patient safety concerns regarding prescribing and dispensing errors between Reminyl® and Amaryl®, Reminyl® (galantamine) is being renamed to Razadyne™ (immediate-release) and Razadyne™ ER (extended-release). The brand name Reminyl® was discontinued with the July, 2005 distribution of Razadyne™.

Pronunciation(ga LAN ta meen)

U.S. Brand NamesRazadyne™; Razadyne™ ER; Reminyl® [DSC]

Canadian Brand NamesReminyl®; Reminyl® ER

Pharmacologic CategoryAcetylcholinesterase Inhibitor (Central)

Use: Labeled IndicationsTreatment of mild-to-moderate dementia of Alzheimer's disease

Use: Unlabeled/InvestigationalSevere dementia associated with Alzheimer's disease; mild-to-moderate dementia associated with Parkinson's disease; Lewy body dementia

Dosing: Adults

Alzheimer's dementia (mild-to-moderate): Oral:

Immediate release tablet or solution: Mild-to-moderate dementia of Alzheimer's: Initial: 4 mg twice a day for 4 weeks; if tolerated, increase to 8 mg twice daily for ≥4 weeks; if tolerated, increase to 12 mg twice daily

Range: 16-24 mg/day in 2 divided doses

Extended-release capsule: Initial: 8 mg once daily for 4 weeks; if tolerated, increase to 16 mg once daily for ≥4 weeks; if tolerated, increase to 24 mg once daily

Range: 16-24 mg once daily

Note: Oral solution and tablet should be taken with breakfast and dinner; capsule should be taken with breakfast. If therapy is interrupted for ≥3 days, restart at the lowest dose and increase to current dose.

Conversion to galantamine from other cholinesterase inhibitors: Patients experiencing poor tolerability with donepezil or rivastigmine should wait until side effects subside or allow a 7-day washout period prior to beginning galantamine. Patients not experiencing side effects with donepezil or rivastigmine may begin galantamine therapy the day immediately following discontinuation of previous therapy (Morris, 2001).

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Moderate renal impairment: Maximum dose: 16 mg/day.

Severe renal dysfunction (Cl_{cr} <9 mL/minute): Use is not recommended

Dosing: Hepatic Impairment

Moderate liver dysfunction (Child-Pugh score 7-9): Maximum dose: 16 mg/day

Severe liver dysfunction (Child-Pugh score 10-15): Use is not recommended

Calculations

- Creatinine Clearance: Adults

Administration: OralAdminister oral solution or tablet with breakfast and dinner; administer extended release capsule with breakfast. If therapy is interrupted for ≥3 days, restart at the lowest dose and increase to current dose. If using oral solution, mix dose with 3-4 ounces of any nonalcoholic beverage; mix well and drink immediately.

Dietary Considerations

Administration with food is preferred, but not required; should be taken with breakfast and dinner (tablet or solution) or with breakfast (capsule).

StorageStore at 15°C to 30°C (59°F to 86°F). Do not freeze oral solution; protect from light.

ContraindicationsHypersensitivity to galantamine or any component of the formulation; severe liver dysfunction (Child-Pugh score 10-15); severe renal dysfunction (Cl_{cr} <9 mL/minute)

Warnings/Precautions

Concerns related to adverse effects:

- Anorexia/weight loss: May cause anorexia and/or weight loss.
- Diarrhea: May cause diarrhea.
- Nausea/vomiting: May cause nausea and/or vomiting.
- Vagotonic effects: Cholinesterase inhibitors may have vagotonic effects which may cause bradycardia and/or heart block with or without a history of cardiac disease.

Disease-related concerns:

- Cardiac conduction abnormalities: Use with caution in patients with sick-sinus syndrome, bradycardia, or conduction abnormalities. Alzheimer's treatment guidelines consider bradycardia to be a relative contraindication for use of centrally-active cholinesterase inhibitors.
- Hepatic impairment: Use with caution in patients with mild to moderate liver impairment; not recommended in severe impairment.
- Peptic ulcer disease: Use with caution in patients at risk of ulcer disease (eg, previous history or NSAID use); may increase gastric acid secretion. Monitor for symptoms of bleeding.
- Renal impairment: Use with caution in patients with moderate renal impairment; not recommended in severe impairment (Cl_{cr} <9 mL/minute).
- Respiratory disease: Use with caution in patients with COPD and/or asthma.
- Seizure disorder: Use with caution in patients with a history of seizure disorder.
- Urinary tract obstruction: Use with caution in patients with bladder outlet obstruction or prostatic hyperplasia; cholinomimetics may cause or worsen outflow obstructions, including possible exacerbation of BPH symptoms.

Concurrent drug therapy issues:

- Depolarizing neuromuscular-blocking agents: May exaggerate neuromuscular blockade effects of depolarizing neuromuscular-blocking agents like succinylcholine.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsNo dosage adjustment needed.

Pregnancy Risk FactorB

Pregnancy ConsiderationsIn animal studies, there was a slight increased in the incident of skeletal variations when given during organogenesis. Adequate, well-controlled studies in pregnant women do not exist. Should be used in pregnancy only if benefit outweighs potential risk to the fetus.

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

>10%: Gastrointestinal: Nausea (6% to 24%), vomiting (4% to 13%), diarrhea (6% to 12%)

1% to 10%:

Cardiovascular: Bradycardia (2% to 3%), syncope (0.4% to 2.2%: dose related), chest pain (≥1%)

Central nervous system: Dizziness (9%), headache (8%), depression (7%), fatigue (5%), insomnia (5%), somnolence (4%)

Gastrointestinal: Anorexia (7% to 9%), weight loss (5% to 7%), abdominal pain (5%), dyspepsia (5%), flatulence (≥1%)

Genitourinary: Urinary tract infection (8%), hematuria (<1% to 3%), incontinence (≥1%)

Hematologic: Anemia (3%)

Neuromuscular & skeletal: Tremor (3%)

Respiratory: Rhinitis (4%)

<1%: Alkaline phosphatase increase, apathy, aphasia, apraxia, ataxia, atrial fibrillation, AV block, bundle branch block, convulsions, cystitis, delirium, dependent edema, diverticulitis, dysphagia, epistaxis, esophageal perforation, fever, gastritis, gastroenteritis, heart failure, hiccups, hyperglycemia, hyper-/hypokinesia, hypertonia, hypotension, involuntary muscle contractions, libido increase, malaise, melena, MI, micturition frequency increased, muscle weakness, nocturia, palpitation, paranoid reaction, paresthesia, paroniria, postural hypotension, purpura, QT prolongation, rectal hemorrhage, renal calculi, saliva increased, stroke, suicide, supraventricular tachycardia, T-wave inversion, thrombocytopenia, TIA, urinary retention, ventricular tachycardia, vertigo, weakness, xerostomia

Postmarketing and/or case reports: Aggression, dehydration, gastrointestinal bleeding, hypokalemia, renal failure (due to dehydration)

Metabolism/Transport Effects**Substrate** (minor) of CYP2D6, 3A4

Drug Interactions

Anticholinergics: May diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antipsychotics: Acetylcholinesterase Inhibitors (Central) may enhance the neurotoxic (central) effect of Antipsychotics. Severe extrapyramidal symptoms have occurred in some patients. *Risk C: Monitor therapy*

Beta-Blockers: Acetylcholinesterase Inhibitors may enhance the bradycardic effect of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Cholinergic Agonists: Acetylcholinesterase Inhibitors may enhance the adverse/toxic effect of Cholinergic Agonists. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. Increased muscular weakness may occur. *Risk C: Monitor therapy*

Ginkgo Biloba: May enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. *Risk C: Monitor therapy*

Neuromuscular-Blocking Agents (Nondepolarizing): Acetylcholinesterase Inhibitors may diminish the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). Acetylcholinesterase Inhibitors may decrease the metabolism of Neuromuscular-Blocking Agents (Nondepolarizing). This is only true for mivacurium in which case the neuromuscular blocking effects might be prolonged. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: May decrease the metabolism of Galantamine. **Exceptions:** Citalopram; Escitalopram; Fluvoxamine. *Risk C: Monitor therapy*

Succinylcholine: Acetylcholinesterase Inhibitors may enhance the neuromuscular-blocking effect of Succinylcholine. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS adverse events).

Herb/Nutraceutical: St John's wort may decrease galantamine serum levels; avoid concurrent use.

Monitoring ParametersMental status

Nursing: Physical Assessment/MonitoringAssess bladder and sphincter adequacy prior to starting therapy. Assess other medications patient may be taking for effectiveness and interactions (especially those dependent on cytochrome P450 metabolism). Monitor therapeutic effectiveness and adverse reactions at beginning of therapy and periodically throughout therapy (eg, cholinergic crisis). Assess knowledge/teach appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationThis medication will not cure Alzheimer's disease, but may help reduce symptoms. Use exactly as directed; do not increase dose or discontinue without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause dizziness, sedation, hypotension, or tremor (use caution when driving or engaging in hazardous tasks, rise slowly from sitting or lying position, and use caution when climbing stairs until response to drug is known); diarrhea (boiled milk, yogurt, or buttermilk may help); or nausea or vomiting (small frequent meals, good mouth care, sucking lozenges, or chewing gum may help). Report persistent GI disturbances; significantly increased salivation, sweating, or tearing; excessive fatigue, insomnia, dizziness, or depression; increased muscle, joint, or body pain or spasms; vision changes; respiratory changes, wheezing, or signs of dyspnea; chest pain or palpitations; or other adverse reactions. **Breast-feeding precaution:** Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, extended release, oral, as hydrobromide:

Razadyne™ ER: 8 mg, 16 mg, 24 mg [contains gelatin]

Solution, oral, as hydrobromide:

Razadyne™: 4 mg/mL (100 mL) [with calibrated pipette]

Tablet, as hydrobromide: 4 mg, 8 mg, 12 mg

Razadyne™: 4 mg, 8 mg, 12 mg

Generic AvailableYes: Tablet

ManufacturerJanssen Pharmaceutica Products, LP

Pricing: U.S. (www.drugstore.com)

Capsule, 24-hour (Razadyne ER)

8 mg (30): $195.48

16 mg (30): $196.03

24 mg (30): $195.99

Tablets (Razadyne)

4 mg (30): $93.37

8 mg (30): $93.37

12 mg (30): $93.37

Mechanism of ActionCentrally-acting cholinesterase inhibitor (competitive and reversible). It elevates acetylcholine in cerebral cortex by slowing the degradation of acetylcholine. Modulates nicotinic acetylcholine receptor to increase acetylcholine from surviving presynaptic nerve terminals. May increase glutamate and serotonin levels.

Pharmacodynamics/Kinetics

Duration: 3 hours; maximum inhibition of erythrocyte acetylcholinesterase ~40% at 1 hour post 8 mg oral dose; levels return to baseline at 30 hours

Absorption: Rapid and complete

Distribution: 175 L; levels in the brain are 2-3 times higher than in plasma

Protein binding: 18%

Metabolism: Hepatic; linear, CYP2D6 and 3A4; metabolized to epigalanthaminone and galanthaminone both of which have acetylcholinesterase inhibitory activity 130 times less than galantamine

Bioavailability: ~90%

Half-life elimination: 7 hours

Time to peak: Immediate release: 1 hour (2.5 hours with food); extended release: 4.5-5 hours

Excretion: Urine (25%)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Index TermsGalantamine Hydrobromide

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(GAL ee um NYE trate)

U.S. Brand NamesGanite™

Pharmacologic CategoryCalcium-Lowering Agent

Use: Labeled IndicationsTreatment of symptomatic cancer-related hypercalcemia

Dosing: Adults **Note:** Initiate I.V. hydration prior to treatment; maintain throughout treatment.

Hypercalcemia: I.V.: 200 mg/m^2/day for 5 days; duration may be shortened during a course if normocalcemia is achieved. If hypercalcemia is mild and with very few symptoms, 100 mg/m^2/day may be used.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Serum creatinine >2.5 mg/dL: Contraindicated

Serum creatinine 2 to ≤2.5 mg/dL: No guidelines exist; frequent monitoring is recommended.

Calculations

- Body Surface Area: Adults

Administration: I.V.The manufacturer recommends continuous I.V. infusion over 24 hours.

Administration: I.V. DetailpH: 6-7

StorageStore unopened vials (25 mg/mL) at room temperature of 20°C to 25°C (68°F to 77°F); not light sensitive. Solutions in 0.9% NaCl or D$_5$W are stable for 48 hours at room temperature or for 7 days under refrigeration at 2°C to 8°C (36°F to 46°F).

ReconstitutionDilute in 1000 mL NS (preferred) or D$_5$W for infusion.

CompatibilityStable in NS, D$_5$W.

ContraindicationsHypersensitivity to gallium nitrate or any component of the formulation; severe renal dysfunction (serum creatinine >2.5 mg/dL)

Warnings/Precautions

Boxed warnings:

- Renal toxicity: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Hypocalcemia: Therapy may result in mild-to-moderate hypocalcemia.
- Renal toxicity: BUN and serum creatinine elevations have been observed with gallium nitrate use; monitor closely; discontinue with serum creatinine >2.5 mg/dL. **[U.S. Boxed Warning]: Concurrent administration with other nephrotoxic drugs (eg, aminoglycosides, amphotericin B) may increase the risk for renal insufficiency; discontinue gallium nitrate during treatment with nephrotoxic drugs.** Establish and maintain adequate hydration with normal saline. Urinary output ≥2 L/day should be established prior to treatment initiation.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients where aggressive hydration may be poorly tolerated, such as in cardiovascular disease (HF or hypertension) and pulmonary disease.

Concurrent drug therapy issues:

- Nephrotoxicity: Discontinue gallium nitrate during treatment with nephrotoxic drugs.

Special populations:

- Pediatrics: Safety and efficacy in children have not been established.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsDue to the potential for adverse reactions in the nursing infant, it is recommended to discontinue nursing during treatment or discontinue gallium nitrate.

Adverse ReactionsNot all frequencies defined.

Cardiovascular: Edema (lower extremity), hypotension, tachycardia

Central nervous system: Coma, confusion, dreams, encephalopathy, fever, hallucinations, hypothermia, lethargy

Dermatologic: Rash

Endocrine & metabolic: Hypophosphatemia (up to 79%), serum bicarbonate decreased (40% to 50%), hypocalcemia (38%), respiratory alkalosis (mild)

Hematologic: Anemia, leukopenia

Gastrointestinal: Constipation, diarrhea, nausea, vomiting

Neuromuscular & skeletal: Paresthesia, positive Cvostek's sign

Ocular: Optic neuritis

Otic: Auditory acuity decreased (<1%), hearing decreased, tinnitus (<1%)

Renal: BUN increased (13%), creatinine increased (13%), acute renal failure

Respiratory: Dyspnea, pleural effusion, pulmonary infiltrates, rales, rhonchi

Oncology: VesicantNo

Oncology: Emetic PotentialLow (10% to 30%)

Drug Interactions

Aminoglycosides: May enhance the nephrotoxic effect of Gallium Nitrate. *Risk X: Avoid combination*

Amphotericin B: May enhance the nephrotoxic effect of Gallium Nitrate. *Risk X: Avoid combination*

Vancomycin: May enhance the nephrotoxic effect of Gallium Nitrate. *Risk X: Avoid combination*

Monitoring ParametersRenal function (BUN, serum creatinine); serum calcium (baseline, then daily); serum phosphorus (baseline, then twice weekly); fluid intake, urine output

Nursing: Physical Assessment/MonitoringUse with caution in presence of renal impairment. Assess potential for interactions with other pharmacological agents patient may be taking (eg, other nephrotoxic drugs). Assess results of laboratory tests and renal function, therapeutic effectiveness (calcium levels), and adverse response (eg, hypotension, tachycardia, gastrointestinal upset, central nervous system changes, hypocalcemia, renal impairment) on a regular basis throughout therapy. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsRenal function (BUN, serum creatinine); serum calcium (baseline, then daily); serum phosphorus (baseline, then twice weekly)

Patient EducationThis medication is given only by intravenous infusion: Report immediately any redness, swelling, or pain at infusion site. Inform prescriber if you experience chest pain, palpitations, or swelling of extremities; difficulty breathing; rash; CNS changes (confusion, dreams, hallucinations); numbness, pain, or tingling in extremities; unusual and persistent fatigue or lethargy; changes in urinary pattern or output; persistent gastrointestinal upset (diarrhea, nausea, vomiting, or constipation); or other adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant or breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

Ganite™: 25 mg/mL (20 mL)

Generic AvailableNo

ManufacturerGenta Pharmaceuticals

Mechanism of ActionInhibits bone resorption by inhibiting osteoclast function. Gallium nitrate appears to be effective in parathyroid hormone-related protein (PTHrP) and non-PTHrP-associated hypercalcemia.

Pharmacodynamics/Kinetics

Onset of calcium lowering: Seen within 24-48 hours of beginning therapy, with normocalcemia achieved within 4-7 days of beginning therapy

Duration: Normocalcemia: 7-10 days

Bioavailability: Oral: 5%

Distribution: Tissue concentrations were determined postmortem in one patient and concentrations were higher in liver and kidney than in lung, skin, muscle, heart, and cervix tumor; in dogs, tissue gallium concentrations were higher in renal cortex, bone, bone marrow, small intestine, and liver than in skeletal muscle and brain

Half-life elimination: Alpha: 1.25 hours; Beta: ~24 hours

Elimination half-life varies with method of administration (72-115 hours with prolonged intravenous infusion versus 24 hours with bolus administration); long elimination half-life may be related to slow release from tissue such as bone

Excretion: Primarily renal with no prior metabolism in the liver or kidney

Pharmacotherapy PearlsIn addition to the hypocalcemic effect, gallium nitrate has also been studied for its antitumor effects. Gallium nitrate was studied at higher doses infused over 30 minutes every 2 weeks in bladder cancer and lymphoma (Einhorn, 2003; Straus, 2003).

Rapid infusion rates and higher doses are associated with an increased risk of toxicity, including nephrotoxicity and gastrointestinal toxicity.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNausea is common; risk may be increased with concomitant SSRI use

Index TermsNSC-15200

Galsulfase

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(gal SUL fase)
U.S. Brand NamesNaglazyme™
Pharmacologic CategoryEnzyme
Use: Labeled IndicationsReplacement therapy in mucopolysaccharidosis VI (MPS VI; Maroteaux-Lamy Syndrome) for improvement of walking and stair-climbing capacity
Dosing: Adults**Note:** Premedicate with antihistamines with/without antipyretics 30-60 minutes prior to infusion.

MPS VI: I.V.: 1 mg/kg once weekly

Dosing: Pediatric**Note:** Premedicate with antihistamines with/without antipyretics 30-60 minutes prior to infusion.

MPS VI: Children >5 years: I.V.: 1 mg/kg once weekly

Administration: I.V.Administer using infusion pump and PVC infusion set with in-line low protein-binding 0.2 micrometer filter. Pretreatment with antihistamines with or without antipyretics is recommended 30-60 minutes prior to infusion. Infuse a 250 mL solution at 6 mL/hour for the first hour. If well-tolerated, increase to 80 mL/hour for the remaining 3 hours. Doses prepared in 100 mL should also be infused over at least 4 hours. In case of infusion-related reactions, decrease infusion rate or temporarily discontinue. Infusion time can be extended up to 20 hours if infusion reactions occur. Discontinue immediately if severe reaction occurs. Patients requiring supplemental oxygen or CPAP during sleep should have these treatments readily available in case of infusion-related or antihistamine-induced reaction.
StoragePrior to use, store vials under refrigeration, 2° to 8°C (36°F to 46°F). Do not freeze or shake. Following dilution, use immediately. May store under refrigeration if used within 48 hours from the time of preparation to the completion of infusion. Do not store solution for infusion at room temperature. Allow vials to reach room temperature prior to dilution. Do not keep vials at room temperature >24 hours prior to dilution. Do not heat or microwave vials.
ReconstitutionAfter calculating dose, round to the nearest whole vial to prepare infusion (do not use partial vials). Dilute in NS to a final volume of 250 mL (including volume of galsulfase). Slowly add galsulfase to infusion bag (compatibility in glass containers has not been studied). Gently rotate to distribute. Do not shake or agitate, do not use filter needle. In patients <20 kg or in those who are susceptible to volume overload, dose may be diluted into a 100 mL NS.
Compatibility

Stable in NS.

Contraindications

Hypersensitivity to galsulfase or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Infusion reactions: Infusion-related reactions have been reported; may be severe; reactions may occur as late as week 55 of treatment. Patients should be premedicated with antihistamines and/or antipyretics prior to infusion; evaluate airway prior to therapy (due to possible effects of antihistamine use). In case of reaction, decrease the rate of infusion, temporarily discontinue the infusion, and/or administer additional antipyretics/antihistamines and possibly corticosteroids.

Disease-related concerns:

- Acute febrile/respiratory illness: Consider delaying treatment in patients with an acute febrile or respiratory illness.

Special populations:

- Adults: Studies did not include patients >29 years of age.

- Pediatrics: Studies did not include children <5 years of age.

Dosage form specific issues:

- Preparation: Excess agitation of solution prior to or after dilution may denature galsulfase rendering it inactive.

Other warnings/precautions:

- Registry: A Clinical Surveillance Program has been created to monitor therapeutic response, progression of disease and adverse effects during long-term treatment; patients should be encouraged to register. Registry information may be obtained at www.MPSVI.com or by calling 866-906-6100.

Pregnancy Risk FactorB
Pregnancy ConsiderationsFetal harm was not reported in animal studies. There are no studies in pregnant women. Pregnant women are encouraged to enroll in the Clinical Surveillance Program.

Lactation

Excretion in breast milk unknown/use caution

Breast-Feeding Considerations

Breast-feeding women are encouraged to enroll in the Clinical Surveillance Program.

Adverse Reactions

Note: Percentages reported are from a placebo-controlled study (39 patients, 19 on galsulfase); also included are adverse effects noted during other clinical studies.

Cardiovascular: Chest pain (16%), facial edema (11%), hypertension (11%)

Central nervous system: Pain (26%), malaise (11%), fever, headache

Gastrointestinal: Abdominal pain (53%), gastroenteritis (11%), diarrhea, nausea, vomiting

Neuromuscular & skeletal: Rigors (21%), areflexia (11%), arthralgia

Ocular: Conjunctivitis (21%), corneal opacification increased (11%)

Otic: Ear pain (42%), otitis media

Respiratory: Dyspnea (21%), pharyngitis (16%), nasal congestion (11%), cough, upper respiratory tract infections

Miscellaneous: Antigalsulfase antibodies (98%), umbilical hernia (11%)

Infusion-related reactions: Angioedema, apnea, bronchospasm, chills, facial and neck urticaria, hypotension, rash, respiratory distress

Drug Interactions There are no known significant interactions.

Monitoring Parameters Monitor for infusion reactions. In clinical studies, tests of mobility and physical function were monitored at baseline and every 6 weeks.

Nursing: Physical Assessment/Monitoring Airway and respiratory status should be evaluated prior to treatment. Premedicate with antihistamines (with or without antipyretics) prior to each administration. See Administration for specific infusion and dosing directions. Patient must be monitored closely with each infusion; infusion reactions may occur as late as week 55 of treatment. Emergency equipment should be at hand during each treatment. If infusion reaction occurs, rate should be decreased or discontinued. Instruct patient/caregiver about participation in the Clinical Surveillance Program. Teach patient and caregiver interventions to reduce side effects and adverse symptoms to report.

Patient Education This medication can only be administered by intravenous infusion. You will be closely monitored during treatment. Report immediately any swelling of face, tongue or lips, difficulty swallowing, difficulty breathing, chills, or rash that occurs during infusion, or any redness, burning, or swelling at infusion site. Inform prescriber if you experience nausea, vomiting, or diarrhea; headache, pain in joints or muscles; ear pain, cough, or other adverse reactions between infusions.

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

Naglazyme™: 5 mg/5 mL (5 mL) [contains polysorbate 80]

Generic Available

No

Manufacturer

BioMarin

Mechanism of Action Galsulfase is a recombinant form of N-acetylgalactosamine 4-sulfatase, produced in Chinese hamster cells. A deficiency of this enzyme leads to accumulation of the glycosaminoglycan dermatan sulfate in various tissues, causing progressive disease which includes decreased growth, skeletal deformities, upper airway obstruction, clouding of the cornea, heart disease, and coarse facial features. Replacement of this enzyme has been shown to improve mobility and physical function (measured by walking and stair-climbing).

Pharmacodynamics/Kinetics

Distribution: V_d: Week 1: 56-323 mL/kg; Week 24: 59-2799 mL/kg

Half-life elimination: Week 1: Median 9 hours (range: 6-21 hours); Week 24: Median 26 hours (range: 8-40 hours)

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status May cause sedation

Mental Health: Effects on Psychiatric Treatment Concomitant administration with psychotropic agents may produce additive sedation; monitor

Index Terms Recombinant N-Acetylgalactosamine 4-Sulfatase; rhASB

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Cytovene® may be confused with Cytosar®, Cytosar-U®

Pronunciation(gan SYE kloe veer)

U.S. Brand NamesCytovene®; Vitrasert®

Canadian Brand NamesCytovene®; Vitrasert®

Pharmacologic CategoryAntiviral Agent

Use: Labeled Indications

Parenteral: Treatment of CMV retinitis in immunocompromised individuals, including patients with acquired immunodeficiency syndrome; prophylaxis of CMV infection in transplant patients

Oral: Alternative to the I.V. formulation for maintenance treatment of CMV retinitis in immunocompromised patients, including patients with AIDS, in whom retinitis is stable following appropriate induction therapy and for whom the risk of more rapid progression is balanced by the benefit associated with avoiding daily I.V. infusions.

Implant: Treatment of CMV retinitis

Use: Unlabeled/InvestigationalMay be given in combination with foscarnet in patients who relapse after monotherapy with either drug

Dosing: AdultsDosing is based on total body weight.

CMV retinitis:

I.V. (slow infusion):

Induction therapy: 5 mg/kg/dose every 12 hours for 14-21 days followed by maintenance therapy

Maintenance therapy: 5 mg/kg/day as a single daily dose for 7 days/week or 6 mg/kg/day for 5 days/week

Oral: 1000 mg 3 times/day with food **or** 500 mg 6 times/day with food

Ocular implant: Intravitreally: One implant for 5- to 8-month period; following depletion of ganciclovir, as evidenced by progression of retinitis, implant may be removed and replaced

Prevention of CMV disease in patients with advanced HIV infection and normal renal function: Oral: 1000 mg 3 times/day with food

Prevention of CMV disease in transplant patients: Same initial and maintenance dose as CMV retinitis except duration of initial course is 7-14 days, duration of maintenance therapy is dependent on clinical condition and degree of immunosuppression

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricCMV retinitis: Children >3 months: Refer to adult dosing.

Dosing: Renal Impairment

I.V. (Induction):

Cl_{cr} 50-69 mL/minute: Administer 2.5 mg/kg/dose every 12 hours.

Cl_{cr} 25-49 mL/minute: Administer 2.5 mg/kg/dose every 24 hours.

Cl_{cr} 10-24 mL/minute: Administer 1.25 mg/kg/dose every 24 hours.

Cl_{cr} <10 mL/minute: Administer 1.25 mg/kg/dose 3 times/week following hemodialysis.

I.V. (Maintenance):

Cl_{cr} 50-69 mL/minute: Administer 2.5 mg/kg/dose every 24 hours.

Cl_{cr} 25-49 mL/minute: Administer 1.25 mg/kg/dose every 24 hours.

Cl_{cr} 10-24 mL/minute: Administer 0.625 mg/kg/dose every 24 hours

Cl_{cr} <10 mL/minute: Administer 0.625 mg/kg/dose 3 times/week following hemodialysis.

Oral:

Cl_{cr} 50-69 mL/minute: Administer 1500 mg/day or 500 mg 3 times/day.

Cl_{cr} 25-49 mL/minute: Administer 1000 mg/day or 500 mg twice daily.

Cl_{cr} 10-24 mL/minute: Administer 500 mg/day.

Cl_{cr} <10 mL/minute: Administer 500 mg 3 times/week following hemodialysis.

Hemodialysis effects: Dialyzable (50%) following hemodialysis; administer dose postdialysis. During peritoneal dialysis, dose as for Cl_{cr} <10 mL/minute. During continuous arteriovenous or venovenous hemofiltration, administer 2.5 mg/kg/dose every 24 hours.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.Should not be administered by I.M., SubQ, or rapid IVP. Administer by slow I.V. infusion over at least 1 hour. Too rapid infusion can cause increased toxicity and excessive plasma levels.
Administration: I.V. DetailFlush line well with NS before and after administration.

pH: 11

Administration: OralShould be administered with food.
Dietary ConsiderationsSodium content of 500 mg vial: 46 mg
StorageIntact vials should be stored at room temperature and protected from temperatures >40°C. Reconstituted solution is stable for 12 hours at room temperature, however, conflicting data indicates that reconstituted solution is stable for 60 days under refrigeration (4°C). Stability of parenteral admixture at room temperature (25°C) and at refrigeration temperature (4°C) is 5 days.
ReconstitutionReconstitute powder with unpreserved sterile water not bacteriostatic water because parabens may cause precipitation. Dilute in 250-1000 mL D_5W or NS to a concentration ≤10 mg/mL for infusion.
CompatibilityStable in D_5W, LR, NS; **incompatible** with paraben preserved bacteriostatic water for injection (may cause precipitation).

Y-site administration: Compatible: Allopurinol, amphotericin B cholesteryl sulfate complex, cisplatin, cyclophosphamide, docetaxel, doxorubicin liposome, enalaprilat, etoposide phosphate, filgrastim, fluconazole, gatifloxacin, granisetron, linezolid, melphalan, methotrexate, paclitaxel, propofol, remifentanil, tacrolimus, teniposide, thiotepa. **Incompatible:** Aldesleukin, amifostine, amsacrine, aztreonam, cefepime, cytarabine, doxorubicin, fludarabine, foscarnet, gemcitabine, ondansetron, piperacillin/tazobactam, sargramostim, vinorelbine. **Variable (consult detailed reference):** Cisatracurium.

ContraindicationsHypersensitivity to ganciclovir, acyclovir, or any component of the formulation; absolute neutrophil count <500/mm^3; platelet count <25,000/mm^3
Allergy Considerations

- Antiviral Acyclic Guanine Derivative Allergy

Warnings/Precautions

Boxed warnings:

- Appropriate use: See “Other warnings/precautions” below.

- Carcinogenic/teratogenic/fertility effects: See “Concerns related to adverse effects” below.

- Blood dyscrasias: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Blood dyscrasias: **[U.S. Boxed Warning]: Granulocytopenia (neutropenia), anemia, and thrombocytopenia may occur.** Dosage adjustment or interruption of therapy may be necessary in patients with neutropenia and/or thrombocytopenia.

- Carcinogenic/teratogenic/fertility effects: **[U.S. Boxed Warning]: Animal studies have demonstrated carcinogenic and teratogenic effects, and inhibition of spermatogenesis;** contraceptive precautions for female and male patients need to be followed during and for at least 90 days after therapy with the drug.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment or interruption of therapy may be necessary.

Other warnings/precautions:

- Administration: Take care to administer only into veins with good blood flow.

- Appropriate use: **[U.S. Boxed Warning]: Indicated only for treatment of CMV retinitis in the immunocompromised patient and CMV prevention in transplant patients at risk.**

Geriatric ConsiderationsAdjust dose based upon renal function.

Pregnancy Risk FactorC

Pregnancy Considerations **[U.S. Boxed Warning]: Animal studies have demonstrated carcinogenic and teratogenic effects, and inhibition of spermatogenesis;** contraceptive precautions for female and male patients need to be followed during and for at least 90 days after therapy.

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsThe CDC recommends **not** to breast-feed if diagnosed with HIV to avoid postnatal transmission of the virus.

Adverse Reactions

>10%:

Central nervous system: Fever (38% to 48%)

Dermatologic: Rash (15% oral, 10% I.V.)

Gastrointestinal: Abdominal pain (17% to 19%), diarrhea (40%), nausea (25%), anorexia (15%), vomiting (13%)

Hematologic: Anemia (20% to 25%), leukopenia (30% to 40%)

1% to 10%:

Central nervous system: Confusion, neuropathy (8% to 9%), headache (4%)

Dermatologic: Pruritus (5%)

Hematologic: Thrombocytopenia (6%), neutropenia with ANC <500/mm^3 (5% oral, 14% I.V.)

Neuromuscular & skeletal: Paresthesia (6% to 10%), weakness (6%)

Ocular: Retinal detachment (8% oral, 11% I.V.; relationship to ganciclovir not established)

Miscellaneous: Sepsis (4% oral, 15% I.V.)

<1% (Limited to important or life-threatening): Alopecia, arrhythmia, ataxia, bronchospasm, coma, dyspnea, encephalopathy, exfoliative dermatitis, extrapyramidal symptoms, nervousness, pancytopenia, psychosis, seizure, alopecia, urticaria, eosinophilia, hemorrhage, Stevens-Johnson syndrome, torsade de pointes, renal failure, SIADH, visual loss

Oncology: VesicantNo

Drug Interactions

Imipenem: Ganciclovir may enhance the adverse/toxic effect of Imipenem. May increase risk of seizures. *Risk X: Avoid combination*

Mycophenolate: May increase the serum concentration of Ganciclovir-Valganciclovir. Ganciclovir-Valganciclovir may increase the serum concentration of Mycophenolate. *Risk C: Monitor therapy*

Reverse Transcriptase Inhibitors (Nucleoside): Ganciclovir-Valganciclovir may enhance the adverse/toxic effect of Reverse Transcriptase Inhibitors (Nucleoside). Hematologic toxicity is of specific concern. **Exceptions:** Stavudine; Zalcitabine. *Risk D: Consider therapy modification*

Tenofovir: Ganciclovir-Valganciclovir may decrease the excretion of Tenofovir. *Risk C: Monitor therapy*

Monitoring ParametersCBC with differential and platelet count, serum creatinine, ophthalmologic exams

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents patient may be taking that may result in increased risk for neutropenia, hematologic toxicity, or nephrotoxicity. **I.V.:** See Administration for infusion specifics. Assess results of laboratory tests prior to therapy and on a regular basis during therapy. Evaluate therapeutic effectiveness and adverse response (eg, paresthesia, neutropenia, anemia, nephrotoxicity, retinal detachment) throughout therapy. Teach proper use (according to formulation), possible side effects/appropriate interventions (importance of contraceptive precautions during and for 90 days following therapy), and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential and platelet count, serum creatinine before beginning therapy and on a regular basis thereafter; liver function tests

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Ganciclovir is not a cure for CMV retinitis. For oral administration, take as directed and maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You will need frequent blood tests and regular ophthalmic exams while taking this drug. You may experience increased susceptibility to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). You may experience confusion or headache (use cautions when driving or engaging in potentially hazardous tasks until response to drug is known); nausea, vomiting, or anorexia (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); diarrhea (buttermilk, boiled milk, or yogurt may help); or photosensitivity (use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight). Report rash, infection (fever, chills, unusual bleeding or bruising, or unhealed sores or white plaques in mouth); abdominal pain; tingling, weakness, or pain in extremities; any vision changes; or pain, redness, swelling at injection site. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Males and females should use appropriate barrier contraceptive measures during and for 60-90 days following end of therapy. Consult prescriber for appropriate barrier contraceptive measures if necessary or if you suspect you might be pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 250 mg, 500 mg

Implant, intravitreal:

Vitrasert®: 4.5 mg [released gradually over 5-8 months]

Injection, powder for reconstitution, as sodium:

Cytovene®: 500 mg

Generic AvailableYes: Capsule
ManufacturerRoche Laboratories Inc
Pricing: U.S. (www.drugstore.com)

Capsules (Cytovene)

250 mg (60): $279.14

500 mg (60): $549.47

Capsules (Ganciclovir)

250 mg (30): $133.67

Mechanism of ActionGanciclovir is phosphorylated to a substrate which competitively inhibits the binding of deoxyguanosine triphosphate to DNA polymerase resulting in inhibition of viral DNA synthesis
Pharmacodynamics/Kinetics

Distribution: V_d: 15.26 L/1.73 m^2; widely to all tissues including CSF and ocular tissue

Protein binding: 1% to 2%

Bioavailability: Oral: Fasting: 5%; Following food: 6% to 9%; Following fatty meal: 28% to 31%

Half-life elimination: 1.7-5.8 hours; prolonged with renal impairment; End-stage renal disease: 5-28 hours

Excretion: Urine (80% to 99% as unchanged drug)

Medication Safety Issues
International issues:

Antagon® (former U.S. brand name for ganirelix): Brand name for astemizole in Mexico; brand name for ranitidine in Brazil

Pronunciation(ga ni REL ix)
Canadian Brand NamesOrgalutran®
Pharmacologic CategoryGonadotropin Releasing Hormone Antagonist
Use: Labeled IndicationsInhibits premature luteinizing hormone (LH) surges in women undergoing controlled ovarian hyperstimulation
Dosing: AdultsAdjunct to controlled ovarian hyperstimulation: SubQ: 250 mcg/day during the mid-to-late phase after initiating follicle-stimulating hormone on day 2 or 3 of cycle. Treatment should be continued daily until the day of chorionic gonadotropin administration.
Dosing: ElderlyRefer to adult dosing.
Administration: OtherAdminister SubQ in abdomen (around upper navel) or upper thigh; rotate injection site.
StorageStore at controlled room temperature of 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Protect from light.
ContraindicationsHypersensitivity to ganirelix or any component of the formulation; hypersensitivity to gonadotropin-releasing hormone (GnRH) or any other GnRH analog; known or suspected pregnancy
Allergy Considerations

- GnRH Antagonist Allergy

Warnings/Precautions

Concerns related to adverse effects:

• Hypersensitivity: Hypersensitivity reactions, including anaphylactoid reactions, have been reported; may occur with the first dose.

Special populations:

• Pregnancy: Exclude pregnancy before beginning treatment.

Dosage form specific issues:

• Latex: The packaging contains natural rubber latex.

Other warnings/precautions:

• Experienced specialists: Should only be prescribed by fertility specialists.

Pregnancy Risk FactorX
Pregnancy ConsiderationsFetal resorption occurred in pregnant rats and rabbits. These effects are results of hormonal alterations and could result in fetal loss in humans. The drug should not be used in pregnant women.
LactationExcretion in breast milk unknown/not recommended
Adverse Reactions

1% to 10%:

Central nervous system: Headache (3%)

Endocrine & metabolic: Ovarian hyperstimulation syndrome (2%)

Gastrointestinal: Abdominal pain (1%), nausea (1%)

Genitourinary: Pelvic pain (5%), vaginal bleeding (2%)

Local: Injection site reaction (1%)

<1%, postmarketing, and/or case reports: Anaphylactoid reaction, hypersensitivity

Drug InteractionsThere are no known significant interactions.
Monitoring ParametersUltrasound to assess follicle size
Nursing: Physical Assessment/MonitoringThis medication should only be prescribed by a fertility specialist. Assess/teach patient use (demonstrate injection procedures, syringe disposal), interventions to reduce side-effects, and adverse reactions to report. **Pregnancy risk factor X:** Pregnancy must be excluded before starting medication.
Monitoring: Lab TestsUltrasound to assess follicle size
Patient EducationThis drug can only be given by injection as demonstrated. Use this and any other medications as directed by prescriber; do not skip any doses. You must keep all scheduled ultrasound appointments. You may experience headache (use of mild analgesic may help); or nausea (small frequent meals, good mouth care, chewing gum, or sucking hard candy may help). Report immediately any sudden or acute

abdominal pain; vaginal bleeding; or pain, itching, or signs of infection at injection site. **Note:** Packaging contains natural rubber latex; if you have a known latex allergy, advise prescriber. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this drug. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as acetate: 250 mcg/0.5 mL [prefilled glass syringe with 27-gauge x $^1/_2$ inch needle]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Solution (Ganirelix Acetate)

250 mcg/0.5 mL (0.5): $114.87

Mechanism of ActionCompetitively blocks the gonadotropin-release hormone receptors on the pituitary gonadotroph and transduction pathway. This suppresses gonadotropin secretion and luteinizing hormone secretion preventing ovulation until the follicles are of adequate size.

Pharmacodynamics/Kinetics

Duration: <48 hours

Absorption: SubQ: Rapid

Distribution: Mean V_d: Single dose: 43.7 L; Multiple dosing: 76.5 L

Protein binding: 81.9%

Metabolism: Hepatic to two primary metabolites (1-4 and 1-6 peptide)

Bioavailability: SubQ: 91.1%

Half-life elimination: Single dose : 12.8 hours; Multiple dosing: 16.2 hours

Time to peak: 1.1 hours

Excretion: Feces (75%) within 288 hours; urine (22%) within 24 hours

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Jump To Field (Select Field Name)

Pronunciation(gat i FLOKS a sin)

U.S. Brand NamesZymar®

Canadian Brand NamesZymar®

Pharmacologic CategoryAntibiotic, Ophthalmic; Antibiotic, Quinolone

Use: Labeled IndicationsTreatment of bacterial conjunctivitis

Dosing: Adults

Bacterial conjunctivitis: Ophthalmic:

> *Days 1 and 2:* Instill 1 drop into affected eye(s) every 2 hours while awake (maximum: 8 times/day)
>
> *Days 3-7:* Instill 1 drop into affected eye(s) up to 4 times/day while awake

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricBacterial conjunctivitis: Children ≥1 year: Ophthalmic: Refer to adult dosing.

StorageStore between 15°C to 25°C (59°F to 77°F); do not freeze.

ContraindicationsHypersensitivity to gatifloxacin, other quinolone antibiotics, or any component of the formulation

Allergy Considerations

- Fluoroquinolone Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Hypersensitivity reactions: Severe hypersensitivity reactions, including anaphylaxis, have occurred with systemic quinolone therapy. The spectrum of these reactions can vary widely; reactions may present as typical allergic symptoms (eg, itching, urticaria, rash, edema) after a single dose, or may manifest as severe idiosyncratic dermatologic (eg, Stevens-Johnson, toxic epidermal necrolysis), vascular (eg, vasculitis), pulmonary (eg, pneumonitis), renal (eg, nephritis), hepatic (eg, hepatic failure or necrosis), and/or hematologic (eg, anemia, cytopenias) events, usually after multiple doses. Prompt discontinuation of drug should occur if skin rash or other symptoms arise.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection.

Special populations:

- Contact lens wearers: Contact lenses should not be worn during treatment of ophthalmic infections.

- Pediatrics: Safety and efficacy have not been established in children <1 year of age.

Dosage form specific issues:

- Ophthalmic solution: Do not inject ophthalmic solution subconjunctivally or introduce directly into the anterior chamber of the eye.

Geriatric ConsiderationsEvaluate the patient's ability to self-administer the ophthalmic product.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReports of arthropathy (observed in immature animals and reported rarely in humans) have limited the use of fluoroquinolones during pregnancy. Gatifloxacin has been show to be fetotoxic in animal studies. There are no adequate and well-controlled studies in pregnant women. Based on limited data, quinolones are not expected to be a major human teratogen. Although quinolone antibiotics should not be used as first-line agents during pregnancy, when considering treatment for life-threatening infection and/or prolonged duration of therapy, the potential risk to the fetus must be balanced against the severity of the potential illness.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsOther quinolones are known to be excreted in breast milk. The manufacturer recommends using caution if gatifloxacin is administered while nursing.

Adverse Reactions

5% to 10%: Ocular: Conjunctival irritation, keratitis, lacrimation increased, papillary conjunctivitis

1% to 4%:

> Central nervous system: Headache
>
> Gastrointestinal: Taste disturbance
>
> Ocular: Chemosis, conjunctival hemorrhage, discharge, dry eye, edema, irritation, pain, visual acuity decreased

Drug Interactions

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Antacids: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. **Exceptions:** Sodium Bicarbonate. *Risk D: Consider therapy modification*

Calcium Salts: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. **Exceptions:** Calcium Chloride. *Risk D: Consider therapy modification*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Corticosteroids (Systemic): Quinolone Antibiotics may enhance the adverse/toxic effect of Corticosteroids (Systemic). Risk of tendon-related side effects, including tendonitis and rupture, may be enhanced. *Risk C: Monitor therapy*

Didanosine: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents (excludes enteric coated formulation of didanosine). *Risk D: Consider therapy modification*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Insulin: May enhance the hyperglycemic effect of Quinolone Antibiotics. Insulin may enhance the hypoglycemic effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Iron Salts: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk D: Consider therapy modification*

Magnesium Salts: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. *Risk D: Consider therapy modification*

Mycophenolate: Quinolone Antibiotics may decrease the serum concentration of Mycophenolate. Specifically, quinolones may decrease concentrations of the active metabolite of mycophenolate. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

Nonsteroidal Anti-Inflammatory Agents: May enhance the neuroexcitatory and/or seizure-potentiating effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Probenecid: May increase the serum concentration of Quinolone Antibiotics. *Risk C: Monitor therapy*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Quinapril: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. *Risk D: Consider therapy modification*

Sevelamer: May decrease the absorption of Quinolone Antibiotics. *Risk D: Consider therapy modification*

Sucralfate: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. *Risk D: Consider therapy modification*

Sulfonylureas: Quinolone Antibiotics may enhance the hyperglycemic effect of Sulfonylureas. Quinolone Antibiotics may enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Quinolone Antibiotics may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Zinc Salts: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. *Risk D: Consider therapy modification*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Monitoring ParametersSigns of infection

Nursing: Physical Assessment/MonitoringAssess allergy history and previous exposure to quinolone antibiotics before initiating therapy. Evaluate therapeutic effectiveness (resolution of infection) and adverse effects (eg, hypersensitivity) regularly during therapy. Teach patient appropriate use, possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationDo not take any new medication during therapy without consulting prescriber. Use as directed: Tilt head back and instill prescribed number of drops in affected eye as often as directed for length of time prescribed. Do not allow dropper to touch any surface, including the eyes or hands. Apply light pressure to the inside corner of the eye (near the nose) after each drop. Avoid wearing contact lenses during treatment. May cause headache or dizziness (use caution when driving or engaging in tasks requiring alertness until response is known). May cause temporary stinging, burning, itching, redness, or tearing; eyelid swelling or itching; or a bad taste in mouth after instillation. Report persistent adverse reactions, visual disturbances, or if condition worsens. If you experience signs of allergic reaction (eg, itching, rash, respiratory difficulty, facial edema, difficulty swallowing), discontinue use immediately and report to prescriber.
Pregnancy/breast-feeding precautions: Inform prescriber if you are or intend to be pregnant or breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, ophthalmic:

Zymar®: 0.3% (5 mL) [contains benzalkonium chloride]

Generic AvailableNo
ManufacturerAllergan
Pricing: U.S. (www.drugstore.com)

Solution (Zymar)

0.3% (5): $74.19

Tablets (Tequin)

200 mg (30): $269.98

Mechanism of ActionGatifloxacin is a DNA gyrase inhibitor, and also inhibits topoisomerase IV. DNA gyrase (topoisomerase II) is an essential bacterial enzyme that maintains the superhelical structure of DNA. DNA gyrase is required for DNA replication and transcription, DNA repair, recombination, and transposition; inhibition is bactericidal.
Pharmacodynamics/KineticsAbsorption: Ophthalmic: Not measurable
Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Taste disturbance.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsGatifloxacin is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution.
Mental Health: Effects on Mental StatusGatifloxacin may cause dizziness, insomnia; may rarely produce abnormal thinking, agitation, anorexia, anxiety, asthenia, ataxia, confusion, depersonalization, depression, euphoria, hallucination, hostility, nervousness, panic attacks, paranoia, psychosis, somnolence, or stress
Mental Health: Effects on Psychiatric TreatmentMay have potential to prolong QT interval; should avoid in patients with uncorrected hypokalemia, or concurrent administration of other medications known to prolong the QT interval (antipsychotics, tricyclic antidepressants, ziprasidone)
Cardiovascular ConsiderationsGatifloxacin causes a dose-dependent QT prolongation. Coadministration of gatifloxacin with other drugs that also prolong the QT interval or induce bradycardia (eg, beta-blockers, amiodarone) should be avoided. Careful consideration should be given in the use of gatifloxacin in patients with cardiovascular disease, particularly in those with conduction abnormalities.
Anesthesia and Critical Care Concerns/Other ConsiderationsGatifloxacin causes a dose-dependent QT prolongation. Coadministration of gatifloxacin with other drugs that also prolong the QT interval or induce bradycardia (eg, beta-blockers, amiodarone) should be done cautiously. Careful consideration should be given in the use of gatifloxacin in patients with cardiovascular disease, particularly in those with conduction abnormalities.
International Brand NamesBonoq (DE); Bonoq-Uro (DE); Fudixing (CL); Gaticin (ID); Gatiflo (JP, KP); Gatilox (PY); Gatimax (ID); Starox (CN); Tequin (AU, BR, MX, MY, ZA); Zequin (PK); Zymar (IL, MY, PH, SG, TH); Zymaran (AR, CO, EC, PE); Zyquin (IN)

Gefitinib

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Gefitinib may be confused with erlotinib

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(ge FI tye nib)

U.S. Brand NamesIRESSA®

Pharmacologic CategoryAntineoplastic Agent, Tyrosine Kinase Inhibitor

Use: Labeled Indications

U.S. labeling: Treatment of locally advanced or metastatic nonsmall cell lung cancer after failure of platinum-based and docetaxel therapies. Treatment is limited to patients who are benefiting or have benefited from treatment with gefitinib.

Note: Due to the lack of improved survival data from clinical trials of gefitinib, and in response to positive survival data with another EGFR inhibitor, physicians are advised to use other treatment options in advanced nonsmall cell lung cancer patients following one or two prior chemotherapy regimens when they are refractory/intolerant to their most recent regimen.

Canada labeling: Approved indication is limited to NSCLC patients with epidermal growth factor receptor (EGFR) expression status positive or unknown.

Dosing: Adults**Note:** In response to the lack of improved survival data from the ISEL trial, AstraZeneca has temporarily suspended promotion of this drug.

Nonsmall cell lung cancer: Oral: 250 mg/day; consider 500 mg/day in patients receiving effective CYP3A4 inducers (eg, rifampin, phenytoin)

Dosing: ElderlyNo adjustment necessary. Refer to adult dosing.

Dosing: Renal ImpairmentNo adjustment necessary.

Dosing: Hepatic ImpairmentNo adjustment necessary.

Dosing: Adjustment for ToxicityConsider interruption of therapy in any patient with evidence of pulmonary decompensation or severe hepatic injury; discontinuation may be required if toxicity is confirmed. Poorly tolerated diarrhea or adverse skin reactions may be managed by a brief interruption of therapy (up to 14 days), followed by reinitiation of therapy at 250 mg/day. Eye pain should be promptly evaluated and therapy may be interrupted based on appropriate medical evaluation; may be reinitiated following resolution of symptoms and eye changes.

Administration: OralMay administer with or without food.

For patients unable to swallow tablets or for administration via NG tube: Tablets may be dispersed in noncarbonated drinking water. Drop whole tablet (do not crush) into $^1/_2$ glass of water; stir until tablet is dispersed (~10 minutes). Drink immediately. Rinse with $^1/_2$ glass of water and drink.

Dietary ConsiderationsFood does not affect gefitinib absorption.

StorageStore tablets at controlled room temperature of 20°C to 25°C (68°F to 77°F).

RestrictionsAs of September 15, 2005, distribution will be limited to patients enrolled in the Iressa Access Program. Under this program, access to gefitinib will be limited to the following groups:

Patients who are currently receiving and benefitting from gefitinib (IRESSA®)

Patients who have previously received and benefited from gefitinib (IRESSA®)

Previously-enrolled patients or new patients in non-Investigational New Drug (IND) clinical trials involving gefitinib (IRESSA®) if these protocols were approved by an IRB prior to June 17, 2005

New patients may also receive Iressa if the manufacturer (AstraZeneca) decides to make it available under IND, and the patients meet the criteria for enrollment under the IND

Additional information on the IRESSA® Access Program, including enrollment forms, may be obtained by calling AstraZeneca at 1-800-601-8933 or via the web at www.Iressa-access.com

ContraindicationsHypersensitivity to gefitinib or any component of the formulation; pregnancy

Allergy Considerations

- Gefitinib Allergy

Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Diarrhea: Interruption of therapy may be required in patients with poorly tolerated diarrhea.

- Eye pain: Promptly evaluate eye pain. Therapy may be interrupted based on appropriate medical evaluation; may be reinitiated following resolution of symptoms and eye changes.

- Pulmonary toxicity: Rare, sometimes fatal, pulmonary toxicity (eg, alveolitis, interstitial pneumonia, pneumonitis) has occurred. Therapy should be interrupted in patients with acute onset or worsening pulmonary symptoms; discontinue if interstitial pneumonitis is confirmed.

- Skin reactions: Interruption of therapy may be required in patients with adverse skin reactions.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; may cause hepatic injury and elevation of transaminases; discontinue if elevations/changes are severe.

- Renal impairment: Use with caution in patients with severe renal impairment.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorD
Pregnancy ConsiderationsAnimal studies have demonstrated fetal harm; there are no well-controlled studies in pregnant women. The risk of fetal harm should be carefully weighed. Women of childbearing potential should be advised to avoid pregnancy.
LactationExcretion in breast milk unknown/not recommended
Adverse Reactions

>10%:

Dermatologic: Rash (43% to 54%), acne (25% to 33%), dry skin (13% to 26%)

Gastrointestinal: Diarrhea (48% to 76%), nausea (13% to 18%), vomiting (9% to 12%)

1% to 10%:

Cardiovascular: Peripheral edema (2%)

Dermatologic: Pruritus (8% to 9%)

Gastrointestinal: Anorexia (7% to 10%), weight loss (3% to 5%), mouth ulceration (1%)

Neuromuscular & skeletal: Weakness (4% to 6%)

Ocular: Amblyopia (2%), conjunctivitis (1%)

Respiratory: Dyspnea (2%), interstitial lung disease (1% to 2%)

<1%: Aberrant eyelash growth, angioedema, corneal erosion and membrane sloughing, epistaxis, erythema multiforme, eye pain, hematuria, hemorrhage, ocular hemorrhaging, ocular ischemia, pancreatitis, toxic epidermal necrolysis, urticaria

Postmarketing and/or case reports: CNS hemorrhage and death were reported in clinical trials of pediatric patients with primary CNS tumors

Oncology: Emetic PotentialVery low (<10%)
Metabolism/Transport Effects**Substrate** of CYP3A4 (major); **Inhibits** CYP2C19 (weak), 2D6 (weak)
Drug Interactions

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Gefitinib. *Risk C: Monitor therapy*

Cardiac Glycosides: Antineoplastic Agents may decrease the absorption of Cardiac Glycosides. This may only affect digoxin tablets. **Exceptions:** Digitoxin. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be

increased. *Risk X: Avoid combination*

Rifamycin Derivatives: May increase the metabolism of Gefitinib. *Risk D: Consider therapy modification*

Topotecan: BCRP/ABCG2 Inhibitors may increase the serum concentration of Topotecan. *Risk D: Consider therapy modification*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vitamin K Antagonists (eg, warfarin): Antineoplastic Agents may enhance the anticoagulant effect of Vitamin K Antagonists. Antineoplastic Agents may diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Gefitinib may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: Grapefruit juice may increase serum gefitinib concentrations; St John's wort may decrease serum gefitinib concentrations.

Monitoring ParametersPeriodic liver function tests (asymptomatic increases in liver enzymes have occurred)

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents or herbal products patient may be taking (eg, increased or decreased levels/effects of gefitinib). Assess results of liver function tests on a regular basis. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsPeriodic liver function tests (asymptomatic increases in liver enzymes have occurred)

Patient EducationDo not take any new medication during therapy without consulting prescriber. Take exactly as directed with or without food. Do not take with grapefruit juice and do not take antacids 2 hours before or 2 hours after taking this mediation. You will need periodic laboratory tests while taking this medication. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience loss of appetite, nausea and vomiting (small, frequent meals and frequent mouth care may help), or diarrhea (buttermilk, boiled milk, or yogurt may help). Report immediately persistent diarrhea; skin rash; unusual or persistent respiratory difficulty or wheezing; chest pain or cough; any change in vision, eye pain, or signs of eye infection; unusual weakness or joint pain; or other persistent adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant. Consult prescriber for appropriate contraceptive measures while on this medication. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 250 mg

Generic AvailableNo

ManufacturerAstraZeneca

Pricing: U.S. (www.drugstore.com)

Tablets (Iressa)

250 mg (30): $1805.91

Mechanism of ActionThe mechanism of antineoplastic action is not fully understood. Gefitinib inhibits tyrosine kinases (TK) associated with transmembrane cell surface receptors found on both normal and cancer cells. One such receptor is epidermal growth factor receptor. TK activity appears to be vitally important to cell proliferation and survival.

Pharmacodynamics/Kinetics

Absorption: Oral: slow

Distribution: I.V.: 1400 L

Protein binding: 90%, albumin and alpha$_1$-acid glycoprotein

Metabolism: Hepatic, primarily via CYP3A4; forms metabolites

Bioavailability: 60%

Half-life elimination: I.V.: 48 hours

Time to peak, plasma: Oral: 3-7 hours

Excretion: Feces (86%); urine (<4%)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Mouth ulceration.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentGI side effects are common; use caution with SSRIs. Carbamazepine may decrease gefitinib concentrations, while nefazodone and fluvoxamine may increase its concentrations.

U.S. Brand NamesGelfilm®; Gelfoam®
Pharmacologic CategoryHemostatic Agent
Use: Labeled IndicationsAdjunct to provide hemostasis in surgery; open prostatic surgery
Use: DentalAdjunct to provide hemostasis in oral and dental surgery
Dosing: AdultsHemostasis: Local: Apply packs or sponges dry or saturated with sodium chloride. When applied dry, hold in place with moderate pressure. When applied wet, squeeze to remove air bubbles. The powder is applied as a paste prepared by adding approximately 4 mL of sterile saline solution to the powder.
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricRefer to adult dosing.
StorageTo ensure sterility, use immediately after withdrawal from envelope.
ContraindicationsShould not be used in closure of skin incisions since they may interfere with the healing of skin edges
Warnings/Precautions

Disease-related concerns:

- Infection: Do not use in the presence of infection; if signs or symptoms of infection or abscess develop in an area where placed, reoperation may be necessary to remove material and allow drainage.

- Postpartum bleeding/menorrhagia: Do not use to control postpartum bleeding or menorrhagia.

Other warnings/precautions:

- Appropriate use: Do not overpack, product expands by absorbing fluid.

- Sterilization: Do not sterilize by heat.

Pregnancy Risk FactorNo data reported
Adverse Reactions1% to 10%: Local: Infection and abscess formation
Drug InteractionsThere are no known significant interactions.

RegimenNOTE: Multiple variations are listed below.

Variation 1:

Gemcitabine: I.V.: 1000 mg/m^2/day days 1, 8, and 15

[total dose/cycle = 3000 mg/m^2]

Cisplatin: I.V.: 100 mg/m^2 day 1

[total dose/cycle = 100 mg/m^2]

Repeat cycle every 28 days

Variation 2:

Gemcitabine: I.V.: 1250 mg/m^2/day days 1 and 8

[total dose/cycle = 2500 mg/m^2]

Cisplatin: I.V.: 100 mg/m^2 day 1

[total dose/cycle = 100 mg/m^2]

Repeat cycle every 21 days

Variation 3:

Gemcitabine: I.V.: 1000 mg/m^2/day days 1 and 8

[total dose/cycle = 2000 mg/m^2]

Cisplatin: I.V.: 80 mg/m^2 day 1

[total dose/cycle = 80 mg/m^2]

Repeat cycle every 21 days

Variation 4:

Gemcitabine: I.V.: 1250 mg/m^2/day days 1 and 8

[total dose/cycle = 2500 mg/m^2]

Cisplatin: I.V.: 75 mg/m^2 day 1

[total dose/cycle = 75 mg/m^2]

Repeat cycle every 21 days for up to 6 cycles

Variation 5:

Gemcitabine: I.V.: 1000 mg/m^2/day days 1, 8, and 15

[total dose/cycle = 3000 mg/m^2]

Cisplatin: I.V.: 100 mg/m^2 day 15

[total dose/cycle = 100 mg/m^2]

Repeat cycle every 28 days

Variation 6:

Gemcitabine: I.V.: 1000 mg/m^2/day days 1, 8, and 15

[total dose/cycle = 3000 mg/m^2]

Cisplatin: I.V.: 100 mg/m^2 day 2

[total dose/cycle = 100 mg/m^2]

Repeat cycle every 28 days for 5 cycles

Variation 7:

Gemcitabine: I.V.: 1200 mg/m^2/day days 1, 8, and 15

[total dose/cycle = 3600 mg/m^2]

Cisplatin: I.V.: 100 mg/m^2 day 15

[total dose/cycle = 100 mg/m^2]

Repeat cycle every 28 days for up to 6 cycles

Variation 8 (patients ≥70 years of age):

Gemcitabine: I.V.: 1000 mg/m^2/day days 1 and 8

[total dose/cycle = 2000 mg/m^2]

Cisplatin: I.V.: 60 mg/m^2 day 1

[total dose/cycle = 60 mg/m^2]

Repeat cycle every 21 days for up to 6 cycles

Medication Safety Issues

Sound-alike/look-alike issues:

Gemcitabine may be confused with gemtuzumab

Gemzar® may be confused with Zinecard®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(jem SITE a been)
U.S. Brand NamesGemzar®
Canadian Brand NamesGemzar®
Pharmacologic CategoryAntineoplastic Agent, Antimetabolite (Pyrimidine Analog)
Use: Labeled IndicationsTreatment of metastatic breast cancer; locally-advanced or metastatic nonsmall cell lung cancer (NSCLC) or pancreatic cancer; advanced, relapsed ovarian cancer
Use: Unlabeled/InvestigationalTreatment of bladder cancer, acute leukemia
Dosing: AdultsRefer to individual protocols. **Note**: Prolongation of the infusion time >60 minutes and administration more frequently than once weekly have been shown to increase toxicity. I.V.:

Pancreatic cancer: Initial: 1000 mg/m^2 weekly for up to 7 weeks followed by 1 week rest; then weekly for 3 weeks out of every 4 weeks.

Dose adjustment: Patients who complete an entire cycle of therapy may have the dose in subsequent cycles increased by 25% as long as the absolute granulocyte count (AGC) nadir is >1500 x 10^6/L, platelet nadir is >100,000 x 10^6/L, and nonhematologic toxicity is less than WHO Grade 1. If the increased dose is tolerated (with the same parameters) the dose in subsequent cycles may again be increased by 20%.

Nonsmall cell lung cancer:

1000 mg/m^2 days 1, 8, and 15; repeat cycle every 28 days

or

1250 mg/m^2 days 1 and 8; repeat cycle every 21 days

Breast cancer: 1250 mg/m^2 days 1 and 8; repeat cycle every 21 days

Ovarian cancer: 1000 mg/m^2 days 1 and 8; repeat cycle every 21 days

Bladder cancer (unlabeled use):

I.V.: 1000 mg/m^2 once weekly for 3 weeks; repeat cycle every 4 weeks

Intravesicular instillation: 2000 mg (in 100 mL NS; retain for 1 hour) twice weekly for 3 weeks; repeat cycle every 4 weeks (for at least 2 cycles)

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentThe FDA-approved labeling does not contain dosing adjustment guidelines; use caution. Gemcitabine has not been studied in patients with significant renal dysfunction.
Dosing: Hepatic ImpairmentThe FDA-approved labeling does not contain dosing adjustment guidelines; use caution. Gemcitabine has not been studied in patients with significant hepatic dysfunction. The following guidelines have been used by some clinicians (Floyd, 2006):
Serum bilirubin >1.6 mg/dL: Use starting dose of 800 mg/m^2
Dosing: Adjustment for Toxicity

Pancreatic cancer: Hematologic toxicity:

AGC ≥1000 x 10^6/L and platelet count ≥100,000 x 10^6/L: Administer 100% of full dose

AGC 500-999 x 10^6/L or platelet count 50,000-90,000 x 10^6/L: Administer 75% of full dose

AGC <500 x 10^6/L or platelet count <50,000 x 10^6/L: Hold dose

Nonsmall cell lung cancer:

Hematologic toxicity: Refer to guidelines for pancreatic cancer. Cisplatin dosage may also need adjusted.

Severe (grades 3 or 4) nonhematologic toxicity (except alopecia, nausea and vomiting): Hold or decrease dose by 50%.

Breast cancer:

Hematologic toxicity: Adjustments based on granulocyte and platelet counts on day 8:

AGC ≥1200 x 10^6/L and platelet count >75,000 x 10^6/L: Administer 100% of full dose

AGC 1000-1199 x 10^6/L or platelet count 50,000-75,000 x 10^6/L: Administer 75% of full dose

AGC 700-999 x 10^6/L and platelet count ≥50,000 x 10^6/L: Administer 50% of full dose

AGC <700 x 10^6/L or platelet count <50,000 x 10^6/L: Hold dose

Severe (grades 3 or 4) nonhematologic toxicity (except alopecia, nausea, and vomiting): Hold or decrease dose by 50%. Paclitaxel dose may also need adjusted.

Ovarian cancer:

Hematologic toxicity: Adjustments based on granulocyte and platelet counts on day 8:

AGC ≥1500 x 10^6/L and platelet count ≥100,000 x 10^6/L: Administer 100% of full dose

AGC 1000-1499 x 10^6/L and/or platelet count 75,000-99,999 x 10^6/L: Administer 50% of full dose

AGC <1000 x 10^6/L and/or platelet count <75,000 x 10^6/L: Hold dose

Severe (grades 3 or 4) nonhematologic toxicity (except nausea and vomiting): Hold or decrease dose by 50%. Carboplatin dose may also need adjusted.

Dose adjustment for subsequent cycles:

AGC < 500 x 10^6/L for >5 days, AGC <100 x 10^6/L for >3 days, febrile neutropenia, platelet count <25,000 x 10^6/L, cycle delay >1 week due to toxicity: Reduce gemcitabine to 800 mg/m2 on days 1 and 8.

For recurrence of any of the above toxicities after initial dose reduction: Administer gemcitabine 800 mg/m^2 on day 1 only for the subsequent cycle

Dosing: Combination Regimens

Biliary adenocarcinoma:

Calculations

- Body Surface Area: Adults

Administration: I.V.Infuse over 30 minutes. **Note**: Prolongation of the infusion time >60 minutes has been shown to increase toxicity. Gemcitabine is being investigated in clinical trials for fixed dose rate (FDR) infusion administration at doses from 1000 mg/m^2 to 2200 mg/m^2 at a rate of 10 mg/m^2/minute. Prolonged infusion times increase the accumulation of the active metabolite, gemcitabine triphosphate. Patients who receive gemcitabine FDR experience more grade 3/4 hematologic toxicity.

Administration: I.V. DetailpH: 2.7-3.3

StorageStore intact vials at room temperature of 20°C to 25°C (68°F to 77°F). Reconstituted vials are stable for up to 35 days and infusion solutions diluted in 0.9% sodium chloride are stable up to 7 days at 23°C when protected from light ; however, the manufacturer recommends use within 24 hours for both reconstituted vials and infusion solutions. Do not refrigerate.

ReconstitutionReconstitute the 200 mg vial with preservative free 0.9% NaCl 5 mL or the 1000 mg vial with preservative free 0.9% NaCl 25 mL. Resulting solution is 38 mg/mL. Dilute with 50-500 mL 0.9% sodium chloride injection or D_5W to concentrations as low as 0.1 mg/mL.

CompatibilityStable in D_5W, NS.

Y-site administration: Compatible: Amifostine, amikacin, aminophylline, ampicillin, ampicillin/sulbactam, aztreonam, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, cefazolin, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chlorpromazine, cimetidine, ciprofloxacin, cisplatin, clindamycin, co-trimoxazole, cyclophosphamide, cytarabine, dactinomycin, daunorubicin, dexamethasone sodium phosphate, dexrazoxane, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxycycline, droperidol, enalaprilat, etoposide, etoposide phosphate, famotidine, floxuridine, fluconazole, fludarabine, fluorouracil, gatifloxacin, gentamicin, granisetron, haloperidol, heparin, hydrocortisone sodium phosphate, hydrocortisone sodium succinate, hydromorphone, hydroxyzine, idarubicin, ifosfamide, leucovorin, linezolid, lorazepam, mannitol, meperidine, mesna, metoclopramide, metronidazole, minocycline, mitoxantrone, morphine, nalbuphine, netilmicin, ofloxacin, ondansetron, paclitaxel, plicamycin, potassium chloride, promethazine, ranitidine, sodium bicarbonate, streptozocin, teniposide, thiotepa, ticarcillin, ticarcillin/clavulanate, tobramycin, topotecan, vancomycin, vinblastine, vincristine, vinorelbine, zidovudine. **Incompatible:** Acyclovir, amphotericin B, cefoperazone, cefotaxime, furosemide, ganciclovir, imipenem/cilastatin, irinotecan, methotrexate, methylprednisolone sodium succinate, mitomycin, piperacillin, piperacillin/tazobactam, prochlorperazine edisylate.

ContraindicationsHypersensitivity to gemcitabine or any component of the formulation; pregnancy

Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: May cause bone marrow suppression (leukopenia, thrombocytopenia, and anemia); myelosuppression is usually the dose-limiting toxicity.
- Fever: May cause fever in the absence of clinical infection.
- Hemolytic uremic syndrome: With use, hemolytic uremic syndrome has been reported; monitor for evidence of microangiopathic hemolysis (elevation of bilirubin or LDH, reticulocytosis, severe thrombocytopenia, and/or renal failure).
- Hepatotoxicity: Serious hepatotoxicity has been reported; use caution with hepatic impairment (history of cirrhosis, hepatitis, or alcoholism) or in patients with hepatic metastases; may lead to exacerbation of hepatic impairment.
- Pulmonary toxicity: With use, pulmonary toxicity has occurred; discontinue if severe.

Disease-related concerns:

- Renal impairment: Use with caution in patients with pre-existing renal impairment.

Special populations:

- Elderly: Use with caution in the elderly; clearance is affected by age.
- Pediatrics: Efficacy has not been established in children.
- Radiation therapy recipients: Use with caution with concurrent radiation therapy; radiation toxicity has been reported with concurrent and nonconcurrent administration; may have radiosensitizing activity when gemcitabine and radiation therapy are given ≤7 days apart; optimum regimen for combination therapy has not been determined for all tumor types.

Other warnings/precautions:

- Administration: Prolongation of the infusion time >60 minutes and more frequent than weekly dosing have been shown to increase toxicity.

Geriatric ConsiderationsClearance is affected by age. There is no evidence; however, that unusual dose adjustment is necessary in patients older than 65 years of age. In general, adverse reaction rates were similar to patients older and younger than 65 years. Grade 3/4 thrombocytopenia was more common in the elderly. Older women were more likely to experience grade 3/4 neutropenia and thrombocytopenia.

Pregnancy Risk FactorD

Pregnancy ConsiderationsEmbryotoxicity and fetal malformations (cleft palate, incomplete ossification, fused pulmonary artery, absence of gallbladder) have been reported in animal studies. There are no adequate and well-controlled studies in pregnant women. If patient becomes pregnant, she should be informed of risks.

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

>10%:

Cardiovascular: Peripheral edema (20%), edema (13%)

Central nervous system: Pain (10% to 48%), fever (30% to 41%), somnolence (5% to 11%)

Dermatologic: Rash (24% to 30%), alopecia (15% to 18%), pruritus (13%)

Gastrointestinal: Nausea/vomiting (64% to 71%; grades 3/4: 1% to 13%), constipation (10% to 31%), diarrhea (19% to 30%), stomatitis (10% to 14%)

Hematologic: Anemia (65% to 73%; grade 4: 1% to 3%), leukopenia (62% to 71%; grade 4: ≤1%), neutropenia (61% to 63%; grade 4: 6% to 7%), thrombocytopenia (24% to 47%; grade 4: ≤1%), hemorrhage (4% to 17%; grades 3/4: <1% to 2%); myelosuppression is the dose-limiting toxicity

Hepatic: Transaminases increased (67% to 78%; grades 3/4: 1% to 12%), alkaline phosphatase increased (55% to 77%; grades 3/4: 2% to 16%), bilirubin increased (13% to 26%; grades 3/4: <1% to 6%)

Renal: Proteinuria (10% to 45%; grades 3/4: <1%), hematuria (13% to 35%; grades 3/4: <1%), BUN increased (8% to 16%; grades 3/4: 0%)

Respiratory: Dyspnea (6% to 23%)

Miscellaneous: Flu-like syndrome (19%), infection (8% to 16%; grades 3/4: <1% to 2%)

1% to 10%:

Local: Injection site reactions (4%)

Neuromuscular & skeletal: Paresthesia (2% to 10%)

Renal: Creatinine increased (2% to 8%)

Respiratory: Bronchospasm (<2%)

<1%, postmarketing, and/or case reports (reported with single-agent use or with combination therapy, all reported rarely): Adult respiratory distress syndrome, anaphylactoid reaction, anorexia, arrhythmias, bullous skin eruptions, cellulitis, cerebrovascular accident, CHF, chills, cough, desquamation, diaphoresis, gangrene, GGT increased, headache, hemolytic uremic syndrome (HUS), hepatotoxic reaction (rare), hypertension, insomnia, interstitial pneumonitis, liver failure, malaise, MI, peripheral vasculitis, petechiae, pulmonary edema, pulmonary fibrosis, radiation recall, renal failure, respiratory failure, rhinitis, sepsis, supraventricular arrhythmia, weakness

Oncology: VesicantNo

Oncology: Emetic PotentialLow (10% to 30%)

Drug Interactions

Bleomycin: Gemcitabine may enhance the adverse/toxic effect of Bleomycin. The risk of pulmonary toxicity may be increased. *Risk D: Consider therapy modification*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Fluorouracil: Gemcitabine may increase the serum concentration of Fluorouracil. *Risk C: Monitor therapy*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vitamin K Antagonists (eg, warfarin): Antineoplastic Agents may enhance the anticoagulant effect of Vitamin K Antagonists. Antineoplastic Agents may diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (due to GI irritation).

Monitoring ParametersCBC with differential and platelet count (prior to each dose); hepatic and renal function (prior to initiation of therapy and periodically, thereafter); monitor electrolytes, including potassium, magnesium, and calcium (when in combination therapy with cisplatin)

Nursing: Physical Assessment/MonitoringSee specific Administration directions (adverse reactions increase when infused over >60 minutes). Assess results of laboratory tests (eg, CBC with differential and platelet count), prior to each dose. Monitor patient response (symptom relief) and adverse reactions (eg, CNS changes, rash, gastrointestinal upset, anemia, myelosuppression, dyspnea) prior to each treatment and on a regular basis throughout therapy. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential and platelet count (prior to each dose); hepatic and renal function (prior to initiation of therapy and periodically, thereafter); monitor electrolytes, including potassium, magnesium, and calcium (when in combination therapy with cisplatin)

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This drug can only be administered by infusion; report any redness, pain, or swelling at infusion site. During therapy, do not use alcohol. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake, and nutrition (small, frequent meals may help). You will be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). You may experience fatigue, lethargy, somnolence (use caution when driving or engaging in potentially hazardous tasks until response to drug is known); nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); loss of hair (reversible); mouth sores (frequent mouth care and use of a soft toothbrush or cotton swabs may help); or diarrhea (buttermilk, boiled milk, or yogurt may help reduce diarrhea). This drug may cause sterility. Report extreme fatigue; severe GI upset or diarrhea; bleeding or bruising; fever, chills, sore throat; vaginal discharge; signs of fluid retention (swelling extremities, respiratory difficulty, unusual weight gain); yellowing of skin or eyes; change in color of urine or stool; muscle or skeletal pain or weakness; or other persistent adverse effects. **Pregnancy/breast-feeding precautions**: Inform prescriber if you are pregnant. Do not get pregnant while taking this medication. Consult prescriber for appropriate barrier contraceptive measures. This drug may cause severe fetal birth defects. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Gemzar®: 200 mg, 1 g

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Solution (reconstituted) (Gemzar)

1 g (1): $771.17

200 mg (1): $154.75

Mechanism of ActionA pyrimidine antimetabolite that inhibits DNA synthesis by inhibition of DNA polymerase and ribonucleotide reductase, specific for the S-phase of the cycle. Gemcitabine is phosphorylated intracellularly by deoxycytidine kinase to gemcitabine monophosphate, which is further phosphorylated to active metabolites gemcitabine diphosphate and gemcitabine triphosphate. Gemcitabine diphosphate inhibits DNA synthesis by inhibiting ribonucleotide reductase; gemcitabine triphosphate incorporates into DNA and inhibits DNA polymerase.

Pharmacodynamics/Kinetics

Distribution: Infusions <70 minutes: 50 L/m^2; Long infusion times: 370 L/m^2

Protein binding: Low

Metabolism: Metabolized intracellularly by nucleoside kinases to the active diphosphate (dFdCDP) and triphosphate (dFdCTP) nucleoside metabolites

Half-life elimination:

Gemcitabine: Infusion time ≤1 hour: 42-94 minutes; infusion time 3-4 hours: 4-10.5 hours

Metabolite (gemcitabine triphosphate), terminal phase: 1.7-19.4 hours

Time to peak, plasma: 30 minutes after completion of infusion

Excretion: Urine (92% to 98%; primarily as inactive uracil metabolite); feces (<1%)

Related Information

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Lopid® may be confused with Levbid®, Lodine®, Lorabid®, Slo-bid™

Pronunciation(jem FI broe zil)

U.S. Brand NamesLopid®

Canadian Brand NamesApo-Gemfibrozil®; Gen-Gemfibrozil; GMD-Gemfibrozil; Lopid®; Novo-Gemfibrozil; Nu-Gemfibrozil; PMS-Gemfibrozil

Pharmacologic CategoryAntilipemic Agent, Fibric Acid

Use: Labeled IndicationsTreatment of hypertriglyceridemia in types IV and V hyperlipidemia for patients who are at greater risk for pancreatitis and who have not responded to dietary intervention

Dosing: AdultsHyperlipidemia/hypertriglyceridemia: Oral: 1200 mg/day in 2 divided doses, 30 minutes before breakfast and dinner

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentHemodialysis effects: Not removed by hemodialysis; supplemental dose is not necessary.

Dietary ConsiderationsBefore initiation of therapy, patients should be placed on a standard cholesterol-lowering diet for 3-6 months and the diet should be continued during drug therapy.

ContraindicationsHypersensitivity to gemfibrozil or any component of the formulation; significant hepatic or renal dysfunction; primary biliary cirrhosis; pre-existing gallbladder disease

Allergy Considerations

- Fibric Acid Derivative Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anemia/leukopenia: Have been reported.
- Cholelithiasis: May increase risk of cholelithiasis.
- Elevated transaminases: Elevations in serum transaminases can be seen.
- Malignancy: Possible increased risk of malignancy.
- Myopathy/rhabdomyolysis: Has been associated with rare myositis or rhabdomyolysis; patients should be monitored closely. Patients should be instructed to report unexplained muscle pain, tenderness, weakness, or brown urine.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; deterioration has been seen when used in patients with a serum creatinine >2.0 mg/dL.

Concurrent drug therapy issues:

- HMG-CoA reductase inhibitors: Use caution with HMG-CoA reductase inhibitors; may lead to myopathy, rhabdomyolysis.
- Warfarin: Use with caution in patient taking warfarin; adjustments in warfarin therapy may be required.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: Be careful in patient selection, this is not a first- or second-line choice; other agents may be more suitable. Discontinue if lipid response not seen.
- Hyperlipidemia: Secondary causes of hyperlipidemia should be ruled out prior to therapy.
- Mortality benefit: The use of gemfibrozil has not demonstrated a reduction in cardiovascular mortality.

Geriatric ConsiderationsGemfibrozil is the drug of choice for the treatment of hypertriglyceridemia and hypoalphaproteinemia in the elderly; it is usually well tolerated; myositis may be more common in patients with poor renal function. The definition of and, therefore, when to treat hyperlipidemia in the elderly is a controversial issue. The National Cholesterol Education Program recommends that all adults maintain a plasma cholesterol <160 mg/dL. Older adults with one additional risk factor, goal LDL would be <130 mg/dL. It is the authors' belief that pharmacologic treatment be reserved for those who are unable to obtain a desirable plasma cholesterol concentration by diet alone and for whom the benefits of treatment are believed to outweigh the potential adverse effects, drug interactions, and cost of treatment.

Pregnancy Risk FactorC
LactationExcretion in breast milk unknown/contraindicated
Adverse Reactions

>10%: Gastrointestinal: Dyspepsia (20%)

1% to 10%:

Central nervous system: Fatigue (4%), vertigo (2%), headache (1%)

Dermatologic: Eczema (2%), rash (2%)

Gastrointestinal: Abdominal pain (10%), diarrhea (7%), nausea/vomiting (3%), constipation (1%)

<1% or case reports with probable causation (limited to important or life-threatening): Alkaline phosphatase increased, anemia, angioedema, arthralgia, bilirubin increased, blurred vision, bone marrow hypoplasia, cataracts, cholelithiasis, cholecystitis, cholestatic jaundice, creatine phosphokinase increased, depression, dermatitis, dermatomyositis/polymyositis, dizziness, eosinophilia, exfoliative dermatitis, headache, hypoesthesia, hypokalemia, impotence, intracranial hemorrhage, laryngeal edema, leukopenia, libido decreased, myalgia, myasthenia, myopathy, nephrotoxicity, paresthesia, peripheral neuritis, peripheral vascular disease, pruritus, rash, Raynaud's phenomenon, rhabdomyolysis, somnolence, synovitis, taste perversion, transaminases increased, urticaria, vasculitis

Reports where causal relationship has not been established: Weight loss, extrasystoles, pancreatitis, hepatoma, colitis, confusion, seizure, syncope, retinal edema, decreased fertility (male), renal dysfunction, positive ANA, drug-induced lupus-like syndrome, thrombocytopenia, anaphylaxis, vasculitis, alopecia, photosensitivity

Metabolism/Transport Effects**Substrate** of CYP3A4 (minor); **Inhibits** CYP1A2 (moderate), 2C8 (strong), 2C9 (strong), 2C19 (strong)
Drug Interactions

Antidiabetic Agents (Thiazolidinedione): Gemfibrozil may decrease the metabolism of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Fibric Acid Derivatives. **Exceptions:** Colesevelam. *Risk D: Consider therapy modification*

CYP1A2 Substrates: CYP1A2 Inhibitors (Moderate) may decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP2C19 Substrates: CYP2C19 Inhibitors (Strong) may decrease the metabolism of CYP2C19 Substrates. *Risk D: Consider therapy modification*

CYP2C8 Substrates (High risk): CYP2C8 Inhibitors (Strong) may decrease the metabolism of CYP2C8 Substrates (High risk). *Risk D: Consider therapy modification*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Strong) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

Ezetimibe: Fibric Acid Derivatives may increase the serum concentration of Ezetimibe. *Risk C: Monitor therapy*

HMG-CoA Reductase Inhibitors: Gemfibrozil may enhance the myopathic (rhabdomyolysis) effect of HMG-CoA Reductase Inhibitors. Gemfibrozil may increase the serum concentration of HMG-CoA Reductase Inhibitors. **Exceptions:** Fluvastatin. *Risk D: Consider therapy modification*

Repaglinide: Gemfibrozil may increase the serum concentration of Repaglinide. The addition of itraconazole may augment the effect of gemfibrozil on repaglinide. Management: Consider alternative therapy combinations to avoid this potentially significant interaction. Avoid concurrent use when also used with a CYP3A4 inhibitor. *Risk D: Consider therapy modification*

Sulfonylureas: Fibric Acid Derivatives may enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Fibric Acid Derivatives may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol to decrease triglycerides.
Monitoring ParametersSerum cholesterol, LFTs
Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents patient may be taking (eg, increased risk of myopathy, rhabdomyolysis, hypoglycemia, and toxicity). Assess results of laboratory tests (serum cholesterol and LFTs), therapeutic effectiveness (decreased lipid levels), and adverse reactions (eg, gastrointestinal disturbances) periodically during therapy. Teach proper use, possible side effects/appropriate interventions, and adverse symptoms to report.
Monitoring: Lab TestsSerum cholesterol, LFTs
Patient EducationDo not take any new medication during therapy unless approved by prescriber. Should be taken 30 minutes before meals. Take with milk or meals if GI upset occurs. Avoid alcohol. Follow dietary recommendations of prescriber. You will need check-ups and blood work to assess effectiveness of therapy. You may experience loss of appetite and flatulence (small, frequent meals may help); or diarrhea (buttermilk, boiled milk, or yogurt may help). Report severe stomach pain, nausea, vomiting; headache; persistent diarrhea; or vision changes. **Pregnancy/breast-feeding precautions**: Inform prescriber if you are or intend to become pregnant. Do not breast-feed.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, oral: 600 mg

Lopid®: 600 mg [scored]

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Tablets (Gemfibrozil)

600 mg (60): $15.99

Tablets (Lopid)

600 mg (60): $135.43

Mechanism of ActionThe exact mechanism of action of gemfibrozil is unknown, however, several theories exist regarding the VLDL effect; it can inhibit lipolysis and decrease subsequent hepatic fatty acid uptake as well as inhibit hepatic secretion of VLDL; together these actions decrease serum VLDL levels; increases HDL-cholesterol; the mechanism behind HDL elevation is currently unknown

Pharmacodynamics/Kinetics

Onset of action: May require several days

Absorption: Well absorbed

Protein binding: 99%

Metabolism: Hepatic via oxidation to two inactive metabolites; undergoes enterohepatic recycling

Half-life elimination: 1.4 hours

Time to peak, serum: 1-2 hours

Excretion: Urine (70% primarily as conjugated drug); feces (6%)

Related Information

- Lipid-Lowering Agents

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay rarely cause sedation or depression

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular ConsiderationsFibric acids decrease triglycerides (TGs) by 20% to 50%, and increase HDL-cholesterol (HDL-C) by 10% to 20%. They decrease LDL-cholesterol (LDL-C) by 5% to 20%, however, LDL-C actually may increase by 10% to 30% when fibrates are initiated in patients with high TGs (>400 mg/dL). Although combination therapy with statins has been used in patients with resistant hyperlipidemias, keep vigilant for signs and symptoms of myopathy.

A recent study (VA-HIT) showed that gemfibrozil therapy resulted in a significant reduction in the risk of major cardiovascular events in patients with CHD and isolated low HDL-C ≤40 mg/dL (average: 32 mg/dL) with LDL-C ≤140 mg/dL (average: 111 mg/dL) and TGs ≤300 mg/dL (average: 161 mg/dL) (Rubins, 1999). These findings suggest that the rate of coronary events is reduced by raising HDL-cholesterol levels in patients with isolated low HDL-C levels. The treatment of isolated low HDL-C in the general population is usually reserved for patients at high risk for developing CAD with therapy focused on addressing the other risk factors. At present, minimal if any, data are available on how to use medications in patients with low HDL-C and no risk factors.

Anesthesia and Critical Care Concerns/Other ConsiderationsGemfibrozil increases HDL, decreases total cholesterol and triglycerides. A recent study (HIT), showed that gemfibrozil therapy resulted in a significant reduction in the risk of major cardiovascular events in patients with low HDL-cholesterol. These findings suggest that the rate of coronary events is reduced by raising HDL-cholesterol levels and lowering triglyceride levels. The treatment of low HDL in the general population, is not established.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(je mi FLOKS a sin)

U.S. Brand NamesFactive®

Canadian Brand NamesFactive®

Pharmacologic Category[Antibiotic, Quinolone](); [Respiratory Fluoroquinolone]()

Use: Labeled IndicationsTreatment of acute exacerbation of chronic bronchitis; treatment of community-acquired pneumonia (CAP), including pneumonia caused by multidrug-resistant strains of *S. pneumoniae* (MDRSP)

Use: Unlabeled/InvestigationalAcute sinusitis

Dosing: Adults

Susceptible infections: Oral: 320 mg once daily

Acute exacerbations of chronic bronchitis: Oral: 320 mg once daily for 5 days

Community-acquired pneumonia (mild to moderate): Oral: 320 mg once daily for 5 or 7 days (decision to use 5- or 7-day regimen should be guided by initial sputum culture; 7 days are recommended for MDRSP, *Klebsiella*, or *M. catarrhalis* infection)

Sinusitis (unlabeled use): Oral: 320 mg once daily for 10 days

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} >40 mL/minute: No adjustment required.

Cl_{cr} ≤40 mL/minute (or patients on hemodialysis/CAPD): 160 mg once daily (administer dose following hemodialysis).

Dosing: Hepatic ImpairmentNo adjustment required.

Calculations

- [Creatinine Clearance: Adults]()

Administration: OralMay be administered with or without food, milk, or calcium supplements. Gemifloxacin should be taken 3 hours before or 2 hours after supplements (including multivitamins) containing iron, zinc, or magnesium.

Dietary ConsiderationsMay take tablets with or without food, milk, or calcium supplements. Gemifloxacin should be taken 3 hours before or 2 hours after supplements (including multivitamins) containing iron, zinc, or magnesium.

StorageStore at 25°C (77°F). Protect from light.

RestrictionsAn FDA-approved patient medication guide is available and must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to gemifloxacin, other fluoroquinolones, or any component of the formulation

Warnings/Precautions

Boxed warnings:

- Tendon inflammation/rupture: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Altered cardiac conduction: Fluoroquinolones may prolong QT_c interval; avoid use in patients with a history of QT_c prolongation, uncorrected hypokalemia, hypomagnesemia, or concurrent administration of other medications known to prolong the QT interval (including Class Ia and Class III antiarrhythmics, cisapride, erythromycin, antipsychotics, and tricyclic antidepressants).

- CNS stimulation: Tremor, restlessness, confusion, and very rarely hallucinations or seizures may occur; use with caution in patients with known or suspected CNS disorder. Discontinue in patients who experience significant CNS adverse effects (eg, dizziness, hallucinations, suicidal ideations or actions).

- Glucose regulation: Fluoroquinolones have been associated with the development of serious, and sometimes fatal, hypoglycemia. These events have occurred most often in elderly patients with diabetes, but have also been reported in patients without a prior history of diabetes. Prompt identification and treatment of hypoglycemia is essential. Individual quinolones may differ in their potential to cause this effect. It was most evident with gatifloxacin (no longer marketed as s systemic formulation). Hyperglycemia has also been associated with the use of fluoroquinolones. Patients should be monitored closely for signs/symptoms of disordered glucose regulation.

- Hypersensitivity reactions: Severe hypersensitivity reactions, including anaphylaxis, have occurred with quinolone therapy. The spectrum of these reactions can vary widely; reactions may present as typical allergic symptoms (eg, itching, urticaria, rash, edema) after a single dose, or may manifest as severe idiosyncratic dermatologic (eg, Stevens-Johnson, toxic epidermal necrolysis), vascular (eg, vasculitis), pulmonary (eg, pneumonitis), renal (eg, nephritis), hepatic (eg, hepatic failure or necrosis), and/or hematologic (eg, anemia, cytopenias) events, usually after multiple doses. May cause maculopapular rash, usually 8-10 days after treatment initiation; risk factors may include age <40 years, female gender (including postmenopausal women on HRT), and treatment duration >7 days. Prompt discontinuation of drug should occur if skin rash or other symptoms arise.

- Peripheral neuropathy: The use of quinolones has been linked to peripheral neuropathy (rare); discontinue if symptoms of sensory or sensorimotor neuropathy occur.
- Phototoxicity: Avoid excessive sunlight and take precautions to limit exposure (eg, loose fitting clothing, sunscreen); may cause moderate-to-severe phototoxicity reactions. Discontinue use if photosensitivity occurs.
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.
- Tendon inflammation/rupture: **[U.S. Boxed Warning]: There have been reports of tendon inflammation and/or rupture with quinolone antibiotics; risk may be increased with concurrent corticosteroids, organ transplant recipients, and in patients >60 years of age.** Rupture of the Achilles tendon sometimes requiring surgical repair has been reported most frequently; but other tendon sites (eg, rotator cuff, biceps) have also been reported. Strenuous physical activity may be an independent risk factor for tendonitis. Discontinue at first sign of tendon inflammation or pain. May occur even after discontinuation of therapy.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with significant bradycardia or acute myocardial ischemia.
- Myasthenia gravis: Some quinolones may exacerbate myasthenia gravis, use with caution (rare, potentially life-threatening weakness of respiratory muscles may occur).
- Renal impairment: Use with caution in renal impairment; dosage adjustment required for Cl_{cr} ≤40 mL/minute. May increase risk of tendon rupture.
- Rheumatoid arthritis: Use with caution in patients with rheumatoid arthritis; may increase risk of tendon rupture.
- Seizures: Use with caution in individuals at risk of seizures (CNS disorders or concurrent therapy with medications which may lower seizure threshold). Potential for seizures, although very rare, may be increased with concomitant NSAID therapy.

Special populations:

- Elderly: Adverse effects (eg, tendon rupture, QT changes) may be increased in the elderly.
- G6PD deficiency: Hemolytic reactions may (rarely) occur with quinolone use in patients with latent or actual G6PD deficiency.
- Pediatrics: Safety and effectiveness have not been established in children.

Geriatric ConsiderationsThe risk of torsade de pointes and tendon inflammation and/or rupture associated with the concomitant use of corticosteroids and quinolones is increased in the elderly population. See Warnings/Precautions regarding tendon rupture in patients >60 years of age.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAdverse events have been observed in some animal studies; therefore, the manufacturer classifies gemifloxacin as pregnancy category C. Quinolone exposure during human pregnancy has been reported with other agents (see Ciprofloxacin, Ofloxacin, and Norfloxacin monographs). To date, no specific teratogenic effect or increased pregnancy risk has been identified; however, because of concerns of cartilage damage in immature animals exposed to quinolones and the limited gemifloxacin specific data, gemifloxacin should only be used during pregnancy if a safer option is not available.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsIt is not known if gemifloxacin is excreted in breast milk. Breast-feeding is not recommended by the manufacturer. Although there is no information on the use of gemifloxacin during breast-feeding, other quinolones are generally considered compatible. Nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Gemifloxacin in Pregnancy & Lactation

Adverse Reactions

1% to 10%:

Central nervous system: Headache (4%), dizziness (2%)

Dermatologic: Rash (4%)

Gastrointestinal: Diarrhea (5%), nausea (4%), abdominal pain (2%), vomiting (2%)

Hematologic: Neutropenia/neutrophilia (1%), platelets increased (1%), thrombocythemia (1%),

Hepatic: Transaminases increased (1% to 4%), GGT increased (1%)

Neuromuscular & skeletal: CPK increased (1%)

<1%, postmarketing and/or case reports: Acute renal failure, alkaline phosphatase increased, anaphylactic reaction, anemia, anorexia, arthralgia, back pain, bilirubin increased, BUN increased, constipation, cramps (leg), dermatitis, dyspepsia, dyspnea, eczema, eosinophilia, erythema multiforme, facial edema, fatigue, flatulence, flushing, fungal infection, gastritis, gastroenteritis, genital moniliasis, granulocytopenia, hematocrit decreased/increased, hemoglobin decreased/increased, hemorrhage, hot flashes,

hyperglycemia, hyper-/hypocalcemia, hyper-/hypokalemia, hyper-/hyponatremia, hypoalbuminemia, INR increased, insomnia, leukopenia, moniliasis, myalgia, nervousness, pain, pharyngitis, photosensitivity, pneumonia, pruritus, pseudomembranous colitis, QT_c prolongation, retinal hemorrhage, serum creatinine increased, skin exfoliation, somnolence, supraventricular tachycardia, syncope, taste perversion, tendonitis, tendon rupture, thrombocytopenia, TIA, tremor, urticaria, vaginitis, vertigo, vision abnormal, weakness, xerostomia

Important adverse effects reported with other agents in this drug class include (not reported for gemifloxacin): Allergic reactions, CNS stimulation, hepatic necrosis/failure, hepatitis, hypersensitivity, jaundice, pancytopenia, peripheral neuropathy, pneumonitis (eosinophilic), seizure, sensorimotor-axonal neuropathy (paresthesia, hypoesthesias, dysesthesias, weakness), serum sickness, severe dermatologic reactions (toxic epidermal necrolysis, Stevens-Johnson syndrome), thrombotic thrombocytopenia purpura, torsade de pointes, vasculitis

Drug Interactions

Antacids: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. **Exceptions:** Sodium Bicarbonate. *Risk D: Consider therapy modification*

Calcium Salts: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. **Exceptions:** Calcium Chloride. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Quinolone Antibiotics may enhance the adverse/toxic effect of Corticosteroids (Systemic). Risk of tendon-related side effects, including tendonitis and rupture, may be enhanced. *Risk C: Monitor therapy*

Didanosine: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents (excludes enteric coated formulation of didanosine). *Risk D: Consider therapy modification*

Insulin: May enhance the hyperglycemic effect of Quinolone Antibiotics. Insulin may enhance the hypoglycemic effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Iron Salts: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk D: Consider therapy modification*

Magnesium Salts: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. *Risk D: Consider therapy modification*

Mycophenolate: Quinolone Antibiotics may decrease the serum concentration of Mycophenolate. Specifically, quinolones may decrease concentrations of the active metabolite of mycophenolate. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May enhance the neuroexcitatory and/or seizure-potentiating effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Probenecid: May decrease the excretion of Gemifloxacin. *Risk C: Monitor therapy*

Probenecid: May increase the serum concentration of Quinolone Antibiotics. *Risk C: Monitor therapy*

Quinapril: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. *Risk D: Consider therapy modification*

Sevelamer: May decrease the absorption of Quinolone Antibiotics. *Risk D: Consider therapy modification*

Sucralfate: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. *Risk D: Consider therapy modification*

Sulfonylureas: Quinolone Antibiotics may enhance the hyperglycemic effect of Sulfonylureas. Quinolone Antibiotics may enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Quinolone Antibiotics may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Zinc Salts: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid dong quai, St John's wort (may also cause photosensitization).

Monitoring ParametersWBC, signs/symptoms of infection, renal function

Nursing: Physical Assessment/MonitoringAssess allergy history before initiating therapy. Use caution in presence of bradycardia, CNS disorders, renal dysfunction, or colitis. Assess potential for interactions with other pharmacological agents or herbal products patient may be taking (eg, increased risk of tendon rupture or arrhythmias). Evaluate results of laboratory tests, therapeutic effectiveness (resolution of infection), and adverse effects regularly during therapy. Teach patient proper use (timing of meals, supplements, or other medications), possible side effects/appropriate interventions, and adverse symptoms to report (eg, allergic reaction, tendon pain, opportunistic infection).

Monitoring: Lab TestsWBC, renal function

Patient EducationDo not take any new prescription or over-the-counter medications or herbal products during therapy without consulting prescriber. Take exactly as directed (with or without food). Should be taken at least 3 hours before or 2 hours after antacids or other products containing aluminum, iron, magnesium, or zinc (including multivitamins). Take entire prescription, even if feeling better. Maintain adequate hydration (2-3 L/day of fluids, unless instructed to restrict fluid intake). May cause headache or dizziness (use caution when driving or engaging in hazardous tasks until response to drug is known); nausea, vomiting, or abdominal discomfort (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or diarrhea (buttermilk, boiled milk, or yogurt may reduce diarrhea). Discontinue use immediately and report to prescriber if signs of inflammation or tendon pain occur or if you experience signs of allergic reaction (eg, itching, rash, respiratory difficulty, facial edema, difficulty swallowing). Report CNS changes (eg, hallucinations, suicidal ideation, seizures) or signs of opportunistic infection (unusual fever or chills; vaginal itching or foul-smelling vaginal discharge; easy bruising or bleeding). **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Factive®: 320 mg

Generic AvailableNo

ManufacturerGeneSoft

Pricing: U.S. (www.drugstore.com)

Tablets (Factive)

320 mg (5): $119.99

Mechanism of ActionGemifloxacin is a DNA gyrase inhibitor and also inhibits topoisomerase IV. DNA gyrase (topoisomerase IV) is an essential bacterial enzyme that maintains the superhelical structure of DNA. DNA gyrase is required for DNA replication and transcription, DNA repair, recombination, and transposition; bactericidal

Pharmacodynamics/Kinetics

Absorption: Well absorbed from the GI tract

Distribution: V_{dss}: 4.2 L/kg

Bioavailability: ~71%

Metabolism: Hepatic (minor); forms metabolites (CYP isoenzymes are not involved)

Time to peak, plasma: 0.5-2 hours

Protein binding: ~60% to 70%

Half-life elimination: 7 hours (range 4-12 hours)

Excretion: Feces (61%); urine (36%)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, hallucinations, and suicidal ideation

Mental Health: Effects on Psychiatric TreatmentContraindicated with ziprasidone. May lower seizure threshold; use caution with clozapine. Gemifloxacin may prolong QT interval; avoid use with antipsychotics and TCAs.

Cardiovascular ConsiderationsGemifloxacin causes a dose-dependent QT prolongation. Coadministration of gemifloxacin with other drugs that also prolong the QT interval or induce bradycardia (eg, beta-blockers, amiodarone) should be avoided. Careful consideration should be given in the use of gemifloxacin in patients with cardiovascular disease, particularly in those with conduction abnormalities.

Index TermsDW286; Gemifloxacin Mesylate; LA 20304a; SB-265805

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Gemtuzumab may be confused with gemcitabine

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(gem TOO zoo mab oh zog a MY sin)

U.S. Brand NamesMylotarg®

Canadian Brand NamesMylotarg®

Pharmacologic CategoryAntineoplastic Agent, Monoclonal Antibody

Use: Labeled IndicationsTreatment of relapsed CD33 positive acute myeloid leukemia (AML) in patients ≥60 years of age who are not candidates for cytotoxic chemotherapy

Use: Unlabeled/InvestigationalSalvage therapy for acute promyelocytic leukemia (APL), relapsed/ refractory CD33 positive acute myeloid leukemia in children and adults <60 years

Dosing: AdultsRefer to individual protocols. **Note:** Patients should receive diphenhydramine 50 mg orally and acetaminophen 650-1000 mg orally 1 hour prior to administration of each dose. Acetaminophen dosage should be repeated as needed every 4 hours for 2 additional doses. Pretreatment with methylprednisolone may ameliorate infusion-related symptoms.

AML: I.V.:

≥60 years: 9 mg/m^2 infused over 2 hours. A full treatment course is a total of 2 doses administered with 14 days between doses. Full hematologic recovery is not necessary for administration of the second dose. There has been only limited experience with repeat courses of gemtuzumab ozogamicin.

<60 years (unlabeled use): 9 mg/m^2 infused over 2 hours. A full treatment course is a total of 2 doses administered with 14 days between doses.

APL (unlabeled use): I.V.: 6 mg/m^2 infused over 2 hours. A full treatment course is a total of 2 doses administered with 15 days between doses.

Dosage adjustment with recent hematopoietic stem cell transplant (HSCT): Gemtuzumab use within 3-4 months of HSCT is associated with an increased risk of hepatic veno-occlusive disease, the National Comprehensive Cancer Network (NCCN) guidelines (AML, v.1.2009) recommend a 30% to 50% dosage reduction in this situation.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** Patients should receive diphenhydramine (1 mg/kg) 1 hour prior to infusion and acetaminophen 15 mg/kg 1 hour prior to infusion and every 4 hours for 2 additional doses.

AML (unlabeled use): I.V.: 4-9 mg/m^2 infused over 2 hours every 2 weeks for a total of 1-3 doses per treatment course. Patients received the second and third doses and/or dose escalation if no dose-limiting toxicities were observed. (**Note:** Higher incidences of liver toxicities were observed in children at the 9 mg/m^2 dose level.)

or

Children <3 years: 0.2 mg/kg infused over 2 hours every 2 weeks for a total of 2 doses

Children ≥3 years: 6 mg/m^2 infused over 2 hours every 2 weeks for a total of 2 doses

Dosing: Renal ImpairmentNo recommendation (not studied).

Dosing: Hepatic ImpairmentUse extra caution; has not been studied in patients with bilirubin >2 mg/dL.

Dosing: Adjustment for Toxicity

Dyspnea or significant hypotension: Interrupt infusion; monitor

Anaphylaxis, pulmonary edema, acute respiratory distress syndrome: Strongly consider discontinuing treatment

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics

Administration: I.V.Do not administer as I.V. push or bolus. Administer via I.V. infusion, over at least 2 hours through a low protein-binding

(0.2-1.2 micron) in-line filter. Protect from light during infusion. Premedicate with acetaminophen and diphenhydramine prior to each infusion.

StorageLight sensitive; protect from light (including direct and indirect sunlight, and unshielded fluorescent light). The infusion container should be placed in a UV protectant bag immediately after preparation. Store intact vials under refrigeration at 2°C to 8°C (36°F to 46°F). Reconstituted solutions may be stored for up to 2 hours at room temperature or under refrigeration. Following dilution for infusion, solutions are stable for up to 16 hours at room temperature. Administration requires 2 hours; therefore, the maximum elapsed time from initial reconstitution to completion of infusion should be 20 hours.

ReconstitutionProtect from light during preparation (and administration). Prepare in biologic safety hood with shielded fluorescent light; (some institutions prepare in a darkened room with the lights in the biologic safety cabinet turned off). Allow to warm to room temperature prior to reconstitution. Reconstitute vial with sterile water for injection to a concentration of 1 mg/mL. Dilute in 100 mL of 0.9% sodium chloride injection. Hazardous agent - use appropriate precautions for handling and disposal.

CompatibilityStable in NS. **Incompatible** in D_5W and electrolyte-containing solutions. Infuse via a separate line.

ContraindicationsHypersensitivity to gemtuzumab ozogamicin, calicheamicin derivatives, or any component of the formulation; patients with anti-CD33 antibody

Warnings/Precautions

Boxed warnings:

- Bone marrow suppression: See “Concerns related to adverse effects” below.
- Combination chemotherapy: See “Concurrent drug therapy issues” below.
- Experienced physician: See “Other warnings/precautions” below.
- Hepatotoxicity: See “Concerns related to adverse effects” below.
- Hypersensitivity/infusion reaction: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: **[U.S. Boxed Warning]: Severe myelosuppression occurs in all patients at recommended dosages.**
- Hepatotoxicity: **[U.S. Boxed Warning]: Has been associated with hepatotoxicity, including severe hepatic veno-occlusive disease (VOD).** Symptoms of VOD include right upper quadrant pain, rapid weight gain, ascites, hepatomegaly, and bilirubin/transaminase elevations. Risk may be increased by combination chemotherapy, underlying hepatic disease, or hematopoietic stem cell transplant.
- Hypersensitivity/infusion reaction: **[U.S. Boxed Warning]: Severe hypersensitivity reactions (including anaphylaxis) and other infusion-related reactions may occur.** Infusion-related events are common, generally reported to occur with the first dose after the end of the 2-hour intravenous infusion. These symptoms usually resolved after 2-4 hours with a supportive therapy of acetaminophen, diphenhydramine, and intravenous fluids. Other severe and potentially fatal infusion related pulmonary events (including dyspnea and hypoxia) have been reported infrequently. High peripheral blast counts may increase the risk of severe reactions (consider leukoreduction with hydroxyurea or leukapheresis to lower WBC to <30,000 cells/mm^3 prior to therapy initiation). Fewer infusion-related events were observed after the second dose. Postinfusion reactions (may include fever, chills, hypotension, or dyspnea) may occur during the first 24 hours after administration. Consider discontinuation in patients who develop severe infusion-related reactions.
- Pulmonary events: In addition to infusion-related pulmonary events, gemtuzumab therapy is also associated with acute respiratory distress syndrome, pulmonary infiltrates, pleural effusion, noncardiogenic pulmonary edema, and pulmonary insufficiency. Risk for pulmonary events may be increased with WBC ≥30,000 cells/mm^3. Symptomatic intrinsic lung disease may increase the risk for severe pulmonary reactions.
- Tumor lysis syndrome: May occur as a consequence of leukemia treatment, adequate hydration and prophylactic allopurinol must be instituted prior to use. Other methods to lower WBC <30,000 cells/mm^3 may be considered (hydroxyurea or leukapheresis) to minimize the risk of tumor lysis syndrome.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; has not been studied in patients with serum bilirubin >2 mg/dL.
- Renal impairment: Use with caution in patients with renal impairment; has not been studied.

Concurrent drug therapy issues

- Combination chemotherapy: **[U.S. Boxed Warning]: Safety and efficacy have not been established in combination with other chemotherapy agents.**

Special populations:

- Pediatrics: Not FDA-approved for use in children.
- Poor performance status: Safety and efficacy have not been established in patients with poor performance status.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician. Should only be administered in facilities equipped to monitor and treat patients with leukemia.**

Pregnancy Risk FactorD

Pregnancy ConsiderationsAnimal studies have demonstrated teratogenic effects, fetal loss, and maternal toxicity. There are no adequate and well-controlled studies in pregnant women. May cause fetal harm when administered to a pregnant woman. Women of childbearing potential should avoid becoming pregnant while receiving treatment.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions in the nursing infant, breast-feeding is not recommended.

Adverse ReactionsAdverse reactions reported for adults of all ages. **Note:** A postinfusion symptom complex (fever, chills, less commonly hypertension, and/or dyspnea) may occur within 24 hours of administration; the incidence of infusion-related events decreases with repeat administration.

>10%:

Cardiovascular: Hypotension (20%), hypertension (16%), peripheral edema (14%)

Central nervous system: Fever (82%), chills (66%), headache (37%), pain (18%), dizziness (12%), insomnia (12%)

Dermatologic: Petechiae (19%), rash (18%)

Endocrine & metabolic: Hypokalemia (26%)

Gastrointestinal: Nausea (68%), vomiting (58%), abdominal pain (32%), diarrhea (32%), anorexia (25%), mucositis/stomatitis (25%), constipation (23%)

Hematologic: Thrombocytopenia (grades 3/4: 49% to 99%; median recovery 36-51 days), neutropenia (grades 3/4: 98%; median recovery 40-51 days), leukopenia (grades 3/4: 46% to 96%), lymphopenia (grades 3/4: 94%), anemia/hemoglobin decreased (grades 3/4: 14% to 52%), neutropenic fever (17%), hemorrhage (11% to 13%)

Hepatic: Hyperbilirubinemia (grades 3/4: 29%), veno-occlusive disease (1% to 20%; higher frequency in patients with prior history of or subsequent hematopoietic stem cell transplant), AST increased (grades 3/4: 18%), LDH increased (16%)

Gastrointestinal: Dyspepsia (10%), gingival hemorrhage (9%), melena (1%)

Genitourinary: Vaginal hemorrhage (4%), vaginal bleeding (3%), hematuria (grade 3/4: 1%)

Hematologic: Disseminated intravascular coagulation (DIC) (1%)

Hepatic: ALT increased (grades 3/4: 9%), prothrombin time increased (grades 3/4: 9%), alkaline phosphatase increased (8%; grades 3/4: 4%), ascites (3%), PTT increased (grades 3/4: 2%)

Neuromuscular & skeletal: Arthralgia (10%), myalgia (6%)

Renal: Creatinine increased (2%)

Respiratory: Rhinitis (8%), hypoxia (5%)

<1%, postmarketing, and/or case reports: Acute respiratory distress syndrome, anaphylaxis, bradycardia, Budd-Chiari syndrome, gastrointestinal hemorrhage, hepatic failure, hepatosplenomegaly, hypersensitivity reactions, jaundice, neutropenic sepsis, noncardiogenic pulmonary edema, portal vain thrombosis, pulmonary hemorrhage, renal impairment, renal failure (including renal failure secondary to tumor lysis syndrome)

Oncology: VesicantNo

Oncology: Emetic PotentialModerate (30% to 60%)

Drug Interactions

Abciximab: May enhance the potential for allergic or hypersensitivity reactions to Monoclonal Antibodies. Also may cause thrombocytopenia or diminished therapeutic effects. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (due to GI irritation).

Test InteractionsNone known

Monitoring ParametersMonitor vital signs during the infusion and for 4 hours following the infusion. Monitor for signs/symptoms of postinfusion reaction. Monitor electrolytes, liver function, CBC with differential and platelets frequently. Monitor for signs and symptoms of hepatic veno-occlusssive disease (weight gain, right upper quadrant abdominal pain, hepatomegaly, ascites).

Nursing: Physical Assessment/MonitoringInfusion reactions can be severe; premedication with acetaminophen and diphenhydramine should be administered prior to each infusion and acetaminophen as needed following each infusion. See Administration for specific infusion directions. Patient must be monitored closely during and for 4 hours following treatment for infusion-related reactions (eg, anaphylaxis, pulmonary edema, or ARDS). Assess results of laboratory tests, patient response, and adverse reactions for immediate 24 hours following infusion (eg, postinfusion symptom complex) and regularly between infusions (eg, tachycardia, hyper- or hypotension, CNS changes, gastrointestinal disturbance, hepatic reaction). Teach patient purpose for use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsMonitor electrolytes, liver function, CBC with differential, and platelet counts frequently.

Patient EducationThis medication can only be administered intravenously. During and immediately following infusion, you will be closely monitored; report immediately any burning, pain, or swelling at infusion site; difficulty breathing or swallowing; chest pain, chills, or sudden headache. You will need frequent laboratory tests during course of therapy. Do not use alcohol, aspirin-containing medications, any prescription or OTC medications between treatments without consulting your prescriber. It is important to maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake and nutrition (small frequent meals will help). You will be susceptible to infection (avoid crowds and exposure to infection). You may experience nausea or vomiting (small frequent meals, good mouth care, sucking lozenges or chewing gum may help); contact prescriber if nausea and vomiting persists. Frequent mouth care with a soft toothbrush or soft swabs and avoidance of spicy or salty foods may reduce mouth sores. Report immediately any difficulty breathing, unusual cough, nosebleed, fever, or chills; unusual bleeding or bruising; signs of infection (eg, sore throat, cough, white plaques in mouth or perianal area, burning on urination); chest pain or palpitations; yellowing of the eyes or skin; swelling of extremities; rapid weight gain; right upper quadrant pain; rash; or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant while taking this medication; may cause fetal damage. Consult prescriber for appropriate contraceptives. Do not breast-feed

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution [preservative free]:

Mylotarg®: 5 mg

Generic AvailableNo

ManufacturerWyeth Pharmaceuticals, Inc

Mechanism of ActionAntibody to CD33 antigen, which is expressed on leukemic blasts in 80% of AML patients. Binds to the CD33 antigen, resulting in internalization of the antibody-antigen complex. Following internalization, the calicheamicin derivative is released inside the myeloid cell. The calicheamicin derivative binds to DNA resulting in double strand breaks and cell death. Pluripotent stem cells and nonhematopoietic cells are not affected.

Pharmacodynamics/Kinetics

Distribution: V_{ss}: Adults: Initial dose: 21 L; Repeat dose: 10 L

Half-life elimination: Total calicheamicin: Initial: 41-45 hours, Repeat dose: 60-64 hours; Unconjugated: 100-143 hours (no change noted in repeat dosing)

Time to peak, plasma: Immediate; higher concentrations observed after repeat dose

Pharmacotherapy Pearls**Oncology Comment:** In addition to the FDA-approved indication, the National Comprehensive Cancer Network (NCCN) Acute Myeloid Leukemia Guidelines (AML, v.1.2009) recommend gemtuzumab ozogamicin as salvage and/or post remission therapy for the treatment of acute promyelocytic leukemia (APL). Gemtuzumab has activity (single agent) in patients with persistent disease following postremission arsenic trioxide therapy in APL patients who are not candidates for allogeneic transplantation.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Stomatitis, gingival hemorrhage, and mucositis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness, insomnia, and depression are common

Mental Health: Effects on Psychiatric TreatmentHypotension is common; caution with low potency antipsychotics and TCAs; nausea and vomiting are common, use caution with the SSRIs. Neutropenia is common, use caution with carbamazepine and clozapine.

Index TermsCMA-676; NSC-720568

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Garamycin® may be confused with kanamycin, Terramycin®

Gentamicin may be confused with gentian violet, kanamycin, vancomycin

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication (intrathecal administration) among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(jen ta MYE sin)

U.S. Brand NamesGentak®; Gentasol™

Canadian Brand NamesAlcomicin®; Diogent®; Garamycin®; Gentamicin Injection, USP; SAB-Gentamicin

Pharmacologic CategoryAntibiotic, Aminoglycoside; Antibiotic, Ophthalmic; Antibiotic, Topical

Use: Labeled IndicationsTreatment of susceptible bacterial infections, normally gram-negative organisms including *Pseudomonas*, *Proteus*, *Serratia*, and gram-positive *Staphylococcus*; treatment of bone infections, respiratory tract infections, skin and soft tissue infections, as well as abdominal and urinary tract infections, and septicemia; treatment of infective endocarditis; used topically to treat superficial infections of the skin or ophthalmic infections caused by susceptible bacteria

Dosing: AdultsIndividualization is **critical** because of the low therapeutic index.

Use of ideal body weight (IBW) for determining the mg/kg/dose appears to be more accurate than dosing on the basis of total body weight (TBW). In morbid obesity, dosage requirement may best be estimated using a dosing weight of IBW + 0.4 (TBW - IBW).

Initial and periodic plasma drug levels (eg, peak and trough with conventional dosing) should be determined, particularly in critically-ill patients with serious infections or in disease states known to significantly alter aminoglycoside pharmacokinetics (eg, cystic fibrosis, burns, or major surgery).

Usual dosage ranges:

I.M., I.V.:

Conventional: 1-2.5 mg/kg/dose every 8-12 hours; to ensure adequate peak concentrations early in therapy, higher initial dosage may be considered in selected patients when extracellular water is increased (edema, septic shock, postsurgical, or trauma)

Once daily: 4-7 mg/kg/dose once daily; some clinicians recommend this approach for all patients with normal renal function; this dose is at least as efficacious with similar, if not less, toxicity than conventional dosing

Intrathecal: 4-8 mg/day

Ophthalmic:

Ointment: Instill 1/2” (1.25 cm) 2-3 times/day to every 3-4 hours

Solution: Instill 1-2 drops every 2-4 hours, up to 2 drops every hour for severe infections

Topical: Apply 3-4 times/day to affected area

Indication-specific dosing: I.M., I.V.:

Brucellosis: 240 mg (I.M.) daily or 5 mg/kg (I.V.) daily for 7 days; either regimen recommended in combination with doxycycline

Cholangitis: 4-6 mg/kg once daily with ampicillin

Diverticulitis (complicated): 1.5-2 mg/kg every 8 hours (with ampicillin and metronidazole)

Endocarditis: Treatment: 3 mg/kg/day in 1-3 divided doses

Meningitis*(Enterococcus*sp or*Pseudomonas aeruginosa)*: I.V.: Loading dose 2 mg/kg, then 1.7 mg/kg/dose every 8 hours (administered with another bacteriocidal drug)

Pelvic inflammatory disease: Loading dose: 2 mg/kg, then 1.5 mg/kg every 8 hours

Alternate therapy: 4.5 mg/kg once daily

Plague (*Yersinia pestis*): Treatment: 5 mg/kg/day, followed by postexposure prophylaxis with doxycycline

Pneumonia, hospital- or ventilator-associated: 7 mg/kg/day (with antipseudomonal beta-lactam or carbapenem)

Synergy (for gram-positive infections): 3 mg/kg/day in 1-3 divided doses (with ampicillin)

Tularemia: 5 mg/kg/day divided every 8 hours for 1-2 weeks

Urinary tract infection: 1.5 mg/kg/dose every 8 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricIndividualization is **critical** because of the low therapeutic index.

Use of ideal body weight (IBW) for determining the mg/kg/dose appears to be more accurate than dosing on the basis of total body weight (TBW). In morbid obesity, dosage requirement may best be estimated using a dosing weight of IBW + 0.4 (TBW - IBW).

Initial and periodic plasma drug levels (eg, peak and trough with conventional dosing) should be determined, particularly in critically-ill patients with serious infections or in disease states known to significantly alter aminoglycoside pharmacokinetics (eg, cystic fibrosis, burns, or major surgery).

Usual dosage ranges: I.M., I.V.:

Infants and Children <5 years: 2.5 mg/kg/dose every 8 hours*

Children ≥5 years: 2-2.5 mg/kg/dose every 8 hours*

*__Note:__ Higher individual doses and/or more frequent intervals (eg, every 6 hours) may be required in selected clinical situations (cystic fibrosis) or serum levels document the need

Ophthalmic, Dermatologic infections: Children: Refer to adult dosing.

Indication-specific dosing:

Meningitis: Neonates: I.V.:

0-7 days of age: <2000 g: 2.5 mg/kg every 18-24 hours; >2000 g: 2.5 mg/kg every 12 hours

8-28 days of age: <2000 g: 2.5 mg/kg every 8-12 hours; >2000 g: 2.5 mg/kg every 8 hours

Dosing: Renal Impairment

Conventional dosing:

Cl_{cr} ≥60 mL/minute: Administer every 8 hours

Cl_{cr} 40-60 mL/minute: Administer every 12 hours

Cl_{cr} 20-40 mL/minute: Administer every 24 hours

Cl_{cr} <20 mL/minute: Loading dose, then monitor levels

High-dose therapy: Interval may be extended (eg, every 48 hours) in patients with moderate renal impairment (Cl_{cr} 30-59 mL/minute) and/or adjusted based on serum level determinations.

Hemodialysis: Dialyzable; removal by hemodialysis: 30% removal of aminoglycosides occurs during 4 hours of HD; administer dose after dialysis and follow levels

Removal by continuous ambulatory peritoneal dialysis (CAPD):

Administration via CAPD fluid:

Gram-negative infection: 4-8 mg/L (4-8 mcg/mL) of CAPD fluid

Gram-positive infection (eg, synergy): 3-4 mg/L (3-4 mcg/mL) of CAPD fluid

Administration via I.V., I.M. route during CAPD: Dose as for Cl_{cr} <10 mL/minute and follow levels

Removal via continuous arteriovenous or venovenous hemofiltration: Dose as for Cl_{cr} 10-40 mL/minute and follow levels

Dosing: Hepatic ImpairmentMonitor plasma concentrations.

Calculations

- Adjusted Body Weight
- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics
- Ideal Body Weight: Adults
- Ideal Body Weight: Pediatrics

Administration: I.M.Administer by deep I.M. route if possible. Slower absorption and lower peak concentrations, probably due to poor circulation in the atrophic muscle, may occur following I.M. injection; in paralyzed patients, suggest I.V. route.

Administration: I.V. Some penicillins (eg, carbenicillin, ticarcillin, and piperacillin) have been shown to inactivate aminoglycosides *in* *vitro*. This has been observed to a greater extent with tobramycin and gentamicin, while amikacin has shown greater stability against inactivation. Concurrent use of these agents may pose a risk of reduced antibacterial efficacy *in vivo*, particularly in the setting of profound renal impairment. However, definitive clinical evidence is lacking. If combination penicillin/aminoglycoside therapy is desired in a patient with renal dysfunction, separation of doses (if feasible), and routine monitoring of aminoglycoside levels, CBC, and clinical response should be considered.

Administration: I.V. DetailpH: 3.0-5.5 (I.V./I.M. injection); ph: 4 (premixed infusion in sodium chloride)

Administration: OtherAdminister any other ophthalmics 10 minutes before or after gentamicin preparations.

Dietary ConsiderationsCalcium, magnesium, potassium: Renal wasting may cause hypocalcemia, hypomagnesemia, and/or hypokalemia.

StorageGentamicin is a colorless to slightly yellow solution which should be stored between 2°C to 30°C, but refrigeration is not recommended. I.V. infusion solutions mixed in NS or D_5W solution are stable for 24 hours at room temperature and refrigeration. Premixed bag: Manufacturer expiration date; remove from overwrap stability: 30 days.

CompatibilityStable in dextran 40, D_5W, $D_{10}W$, mannitol 20%, LR, NS; **incompatible** with fat emulsion 10%; **variable stability (consult detailed reference)** in peritoneal dialysis solution.

Y-site administration: Compatible: Acyclovir, alatrofloxacin, amifostine, amiodarone, amsacrine, atracurium, aztreonam, cefpirome, ciprofloxacin, cisatracurium, clarithromycin, cyclophosphamide, cytarabine, diltiazem, docetaxel, doxorubicin liposome, enalaprilat, esmolol, etoposide phosphate, famotidine, fluconazole, fludarabine, foscarnet, gatifloxacin, gemcitabine, granisetron, hydromorphone, IL-2, insulin (regular), labetalol, levofloxacin, linezolid, lorazepam, magnesium sulfate, melphalan, meperidine, meropenem, midazolam, morphine, multivitamins, ondansetron, paclitaxel, pancuronium, perphenazine, remifentanil, sargramostim, tacrolimus, teniposide, theophylline, thiotepa, tolazoline, vecuronium, vinorelbine, vitamin B complex with C, zidovudine. **Incompatible:** Allopurinol, amphotericin B cholesteryl sulfate complex, cefamandole, furosemide, heparin, hetastarch, idarubicin, indomethacin, iodipamide meglumine, phenytoin, propofol, warfarin. **Variable (consult detailed reference):** Filgrastim.

Compatibility in syringe: Compatible: Clindamycin, diatrizoate meglumine 52% and diatrizoate sodium 8%, diatrizoate sodium 60%, iohexol, iopamidol, iothalamate meglumine 60%, penicillin G sodium. **Incompatible:** Ampicillin, cefamandole, heparin. **Variable (consult detailed reference):** Ioxaglate meglumine 39.3% and ioxaglate sodium 19.6%.

Compatibility when admixed: Compatible: Atracurium, aztreonam, bleomycin, cefoxitin, cimetidine, chloroprocaine, ciprofloxacin, fluconazole, hexylcaine, lidocaine, lidocaine with epinephrine, mepivacaine, meropenem, metronidazole, metronidazole with sodium bicarbonate, ofloxacin, penicillin G sodium, piperocaine, procaine, ranitidine, verapamil. **Incompatible:** Amphotericin B, ampicillin, cefamandole, cefazolin with clindamycin, cefepime, heparin, nafcillin, ticarcillin. **Variable (consult detailed reference):** Cefotaxime, cefotetan, cefuroxime, clindamycin, cytarabine, dopamine, floxacillin, furosemide.

ContraindicationsHypersensitivity to gentamicin or other aminoglycosides

Warnings/Precautions

Boxed Warnings:

- Nephrotoxicity: See “Concerns related to adverse effects” below.
- Neurotoxicity: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Nephrotoxicity: **[U.S. Boxed Warning]: May cause nephrotoxicity;** usual risk factors include pre-existing renal impairment, concomitant nephrotoxic medications, advanced age and dehydration. Discontinue treatment if signs of nephrotoxicity occur; renal damage is usually reversible.
- Neuromuscular blockade and respiratory paralysis: May cause neuromuscular blockade and respiratory paralysis; especially when given soon after anesthesia or muscle relaxants.
- Neurotoxicity: **[U.S. Boxed Warning]: May cause neurotoxicity;** usual risk factors include pre-existing renal impairment, concomitant neuro-/nephrotoxic medications, advanced age and dehydration. Ototoxicity is proportional to the amount of drug given and the duration of treatment. Tinnitus or vertigo may be indications of vestibular injury and impending bilateral irreversible damage. Discontinue treatment if signs of ototoxicity occur.
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Hearing impairment: Use with caution in patients with pre-existing vertigo, tinnitus, or hearing loss.
- Hypocalcemia: Use with caution in patients with hypocalcemia.
- Neuromuscular disorders: Use with caution in patients with neuromuscular disorders, including myasthenia gravis.
- Renal impairment: Use with caution in patients with pre-existing renal insufficiency; dosage modification required.

Other warnings/precautions:

- Long-term use: Not intended for long-term therapy due to toxic hazards associated with extended administration.

Geriatric ConsiderationsThe aminoglycosides are important therapeutic interventions for infections due to susceptible organisms and as empiric therapy in seriously ill patients. Their use is not without risk of toxicity, however, these risks can be minimized if initial dosing is adjusted for estimated renal function and appropriate monitoring performed. High dose, once daily aminoglycosides have been advocated as an alternative to traditional dosing regimens. Once daily or extended interval dosing is as effective and may be safer than traditional dosing. The interval must be adjusted for renal function.

Pregnancy Risk FactorC (ophthalmic, topical); D (injection)

Pregnancy ConsiderationsGentamicin crosses the placenta and produces detectable serum levels in the fetus. Because of several reports of total irreversible bilateral congenital deafness in children whose mothers received streptomycin during pregnancy, manufacturers classify gentamicin as pregnancy risk factor D. Renal toxicity has been observed in animals. Other than a single case report of renal cystic dysplasia, reports of fetal toxicity in humans have not been located. Adequate and well-controlled studies have not been conducted in pregnant women and it is not known whether gentamicin can cause fetal harm. Although manufacturers consider systemic gentamicin pregnancy risk factor D, gentamicin-specific clinical data would suggest a pregnancy risk factor C.

Due to pregnancy induced physiologic changes, some pharmacokinetic parameters of gentamicin may be altered. Pregnant women have an average-to-larger volume of distribution which may result in lower serum peak levels than for the same dose in nonpregnant women. Serum half-life is also shorter.

LactationEnters breast milk (small amounts)/use caution (AAP rates “compatible”)

Breast-Feeding ConsiderationsGentamicin is excreted into breast milk; however, it is not well absorbed when taken orally. This limited oral absorption may minimize exposure to the nursing infant. Nondose-related effects could include modification of bowel flora. The AAP considers gentamicin to be “usually compatible with breast-feeding.”

Pregnancy & Lactation, In-Depth

- Gentamicin in Pregnancy & Lactation

Adverse Reactions

>10%:

Central nervous system: Neurotoxicity (vertigo, ataxia)

Neuromuscular & skeletal: Gait instability

Otic: Ototoxicity (auditory), ototoxicity (vestibular)

Renal: Nephrotoxicity, decreased creatinine clearance

1% to 10%:

Cardiovascular: Edema

Dermatologic: Skin itching, reddening of skin, rash

<1%: Drowsiness, headache, pseudomotor cerebri, photosensitivity, allergic reaction, erythema, anorexia, nausea, vomiting, weight loss, increased salivation, enterocolitis, granulocytopenia, agranulocytosis, thrombocytopenia, elevated LFTs, burning, stinging, tremor, muscle cramps, weakness, dyspnea

Oncology: VesicantNo

Oncology: Emetic PotentialVery low (<10%)

Drug Interactions

Amphotericin B: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Bisphosphonate Derivatives: Aminoglycosides may enhance the hypocalcemic effect of Bisphosphonate Derivatives. *Risk C: Monitor therapy*

Botulinum Toxin Type A: Aminoglycosides may enhance the neuromuscular-blocking effect of Botulinum Toxin Type A. *Risk C: Monitor therapy*

Botulinum Toxin Type B: Aminoglycosides may enhance the neuromuscular-blocking effect of Botulinum Toxin Type B. *Risk C: Monitor therapy*

Capreomycin: May enhance the neuromuscular-blocking effect of Aminoglycosides. *Risk C: Monitor therapy*

CARBOplatin: Aminoglycosides may enhance the ototoxic effect of CARBOplatin. Especially with higher doses of carboplatin. *Risk C: Monitor therapy*

CISplatin: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Colistimethate: Aminoglycosides may enhance the nephrotoxic effect of Colistimethate. Aminoglycosides may enhance the neuromuscular-blocking effect of Colistimethate. *Risk D: Consider therapy modification*

CycloSPORINE: Aminoglycosides may enhance the nephrotoxic effect of CycloSPORINE. *Risk C: Monitor therapy*

Gallium Nitrate: Aminoglycosides may enhance the nephrotoxic effect of Gallium Nitrate. *Risk X: Avoid combination*

Loop Diuretics: May enhance the adverse/toxic effect of Aminoglycosides. Specifically, nephrotoxicity and ototoxicity. *Risk C: Monitor therapy*

Neuromuscular-Blocking Agents: Aminoglycosides may enhance the respiratory depressant effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May decrease the excretion of Aminoglycosides. Data only in premature infants. *Risk C: Monitor therapy*

Penicillins: May decrease the serum concentration of Aminoglycosides. Primarily associated with extended spectrum penicillins, and patients with renal dysfunction. **Exceptions:** Amoxicillin; Ampicillin; Cloxacillin; Dicloxacillin; Methicillin; Nafcillin; Oxacillin; Penicillin G (Parenteral/Aqueous); Penicillin G Benzathine; Penicillin G Procaine; Penicillin V Potassium. *Risk D: Consider therapy modification*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vancomycin: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Test Interactions

Some penicillin derivatives may accelerate the degradation of aminoglycosides *in vitro*, leading to a potential underestimation of aminoglycoside serum concentration.

Monitoring ParametersUrinalysis, urine output, BUN, serum creatinine; hearing should be tested before, during, and after treatment; particularly in those at risk for ototoxicity or who will be receiving prolonged therapy (>2 weeks)

Some penicillin derivatives may accelerate the degradation of aminoglycosides *in vitro*. This may be clinically-significant for certain penicillin (ticarcillin, piperacillin, carbenicillin) and aminoglycoside (gentamicin, tobramycin) combination therapy in patients with significant renal impairment. Close monitoring of aminoglycoside levels is warranted.

Reference Range

Timing of serum samples: Draw peak 30 minutes after 30-minute infusion has been completed or 1 hour after I.M. injection; draw trough immediately before next dose

Sample size: 0.5-2 mL blood (red top tube) or 0.1-1 mL serum (separated)

Therapeutic levels:

- Peak:
  - Serious infections: 6-8 mcg/mL (12-17 µmol/L)
  - Life-threatening infections: 8-10 mcg/mL (17-21 µmol/L)
  - Urinary tract infections: 4-6 mcg/mL
  - Synergy against gram-positive organisms: 3-5 mcg/mL
- Trough:
  - Serious infections: 0.5-1 mcg/mL
  - Life-threatening infections: 1-2 mcg/mL
  - The American Thoracic Society (ATS) recommends trough levels of <1 mcg/mL for patients with hospital-acquired pneumonia.

Obtain drug levels after the third dose unless renal dysfunction/toxicity suspected

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Assess kidney function and hearing before, during, and following therapy. **Note:** This medication has a very low TI. Monitor for decreased renal function, ototoxicity, and neurotoxicity. Perform hearing tests prior to initiating treatment and periodically during therapy (>2 weeks) if at high risk. Monitor therapeutic effectiveness, laboratory values and adverse reactions at beginning of therapy and periodically throughout therapy. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsUrinalysis, BUN, serum creatinine, plasma gentamicin levels (as appropriate to dosing method). Peak levels are drawn 30 minutes after the end of a 30-minute infusion or 1 hour after initiation of infusion or I.M. injection. The trough is drawn just before the next dose. Levels are typically obtained after the third dose in conventional dosing. Perform culture and sensitivity studies prior to initiating therapy to determine the causative organism and its susceptibility to gentamicin. Some penicillin derivatives may accelerate the degradation of aminoglycosides.

Patient EducationTake exactly as directed and when prescribed. Drink adequate amounts of water (2-3 L/day) unless instructed to restrict fluid intake. You may experience headaches, ringing in ears, dizziness, blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); GI upset, loss of appetite (small frequent meals and frequent mouth care may help); or photosensitivity (use sunscreen wear protective clothing and eyewear, and avoid direct sunlight). Report severe headache, changes in hearing acuity, ringing in ears, change in balance, changes in urine pattern, persistent diarrhea, respiratory difficulty, rash, fever, unhealed sores, sores in mouth, vaginal drainage, muscle or bone pain, change in gait, or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Ophthalmic: Wash hands before instilling. Sit or lie down to instill. Open eye, look at ceiling, and instill prescribed amount of solution; for ointment, pull lower lid down gently, instill thin ribbon of ointment inside lid. Close eye and roll eye in all directions, and apply gentle pressure to inner corner of eye. Do not let tip of applicator touch eye; do not contaminate tip of applicator (may cause eye infection, eye damage, or vision loss). Temporary stinging or blurred vision may occur. Report persistent pain, burning, vision changes, swelling, itching, or worsening of condition.

Topical: Apply thin film of ointment to affected area as often as recommended. May apply porous dressing. Report persistent burning, swelling, itching, worsening of condition, or lack of response to therapy.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Cream, topical, as sulfate: 0.1% (15 g, 30 g)

Infusion, as sulfate [premixed in NS]: 40 mg (50 mL); 60 mg (50 mL, 100 mL); 70 mg (50 mL); 80 mg (50 mL, 100 mL); 90 mg (100 mL); 100 mg (50 mL, 100 mL); 120 mg (100 mL)

Injection, solution, as sulfate: 10 mg/mL (6 mL, 8 mL, 10 mL)

Injection, solution, as sulfate: 40 mg/mL (2 mL, 20 mL)

Injection, solution [pediatric], as sulfate: 10 mg/mL (2 mL)

Injection, solution [pediatric], as sulfate [preservative free]: 10 mg/mL (2 mL)

Ointment, ophthalmic, as sulfate (Gentak®): 0.3% [3 mg/g] (3.5 g)

Ointment, topical, as sulfate: 0.1% (15 g, 30 g)

Solution, ophthalmic, as sulfate: 0.3% (5 mL, 15 mL) [contains benzalkonium chloride]

Gentak®: 0.3% (5 mL; 15 mL [DSC]) [contains benzalkonium chloride]

Gentasol™: 0.3% (5 mL) [contains benzalkonium chloride]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Cream (Gentamicin Sulfate)

0.1% (15): $12.99

Ointment (Gentamicin Sulfate)

0.1% (15): $9.99

Solution (Genoptic)

0.3% (1): $8.99

Solution (Gentamicin Sulfate)

0.3% (5): $9.99

10 mg/mL (50): $125.00

Mechanism of ActionInterferes with bacterial protein synthesis by binding to 30S and 50S ribosomal subunits resulting in a defective bacterial cell membrane

Pharmacodynamics/Kinetics

Absorption:

Intramuscular: Rapid and complete

Oral: None

Distribution: Primarily into extracellular fluid (highly hydrophilic); high concentration in the renal cortex; minimal penetration to ocular tissues via I.V. route

V_d: Increased by edema, ascites, fluid overload; decreased with dehydration

Neonates: 0.4-0.6 L/kg

Children: 0.3-0.35 L/kg

Adults: 0.2-0.3 L/kg

Relative diffusion from blood into CSF: Minimal even with inflammation

CSF:blood level ratio: Normal meninges: Nil; Inflamed meninges: 10% to 30%

Protein binding: <30%

Half-life elimination:

Infants: <1 week: 3-11.5 hours; 1 week to 6 months: 3-3.5 hours

Adults: 1.5-3 hours; End-stage renal disease: 36-70 hours

Time to peak, serum: I.M.: 30-90 minutes; I.V.: 30 minutes after 30-minute infusion

Excretion: Urine (as unchanged drug)

Clearance: Directly related to renal function

Related Information

- Antibiotic Treatment of Adults With Infective Endocarditis
- Antimicrobial Drugs of Choice
- Community-Acquired Pneumonia in Adults
- Prevention of Infective Endocarditis
- Treatment of Sexually-Transmitted Infections

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness is common; may cause drowsiness

Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine and carbamazepine

Cardiovascular ConsiderationsLoop diuretics may enhance the toxic effects (ototoxicity, nephrotoxicity). This is probably of most concern if the diuretic is administered in high doses for extended periods of time.

Anesthesia and Critical Care Concerns/Other ConsiderationsGentamicin is the only aminoglycoside that is commercially available in a preservative-free solution for injection.

Index TermsGentamicin Sulfate

Gentian Violet

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Gentian violet may be confused with gentamicin

Pronunciation(JEN shun VYE oh let)

Pharmacologic CategoryAntibiotic, Topical; Antifungal Agent, Topical

Use: Labeled IndicationsTreatment of cutaneous or mucocutaneous infections caused by *Candida albicans* and other superficial skin infections; external treatment of minor abrasions or cuts

Dosing: Adults**Superficial skin or mucocutaneous infection:** Topical: Apply to affected area once or twice daily. Solutions diluted to 0.25% to 0.5% may be less irritating. Solutions diluted to 0.01% have been recommended for use in closed cavities.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Superficial skin or mucocutaneous infection:** Refer to adult dosing.

Administration: TopicalApply with cotton-tipped applicator directly to affected area. Do not cover with bandage. If applied to mucous membranes inside mouth, do not allow to be swallowed. Do not use in the eyes.

ContraindicationsHypersensitivity to gentian violet or any component of the formulation; ulcerated areas

Warnings/Precautions

Concerns related to adverse effects:

- Irritation: Discontinue if sensitivity or irritation occur, or if condition worsens.
- Staining: Will stain skin and clothing. Application to ulcerative lesions may result in tattooing.

Other warnings/precautions:

- Appropriate use: For topical use only; avoid contact with eyes. Not for self-medication (OTC use) for serious burns or deep puncture wounds

Pregnancy Risk FactorC

Adverse ReactionsFrequency not defined.

Dermatologic: Necrotic skin reactions, staining, vesicle formation

Gastrointestinal: Esophagitis, gastrointestinal irritation, ulceration of mucous membranes

Genitourinary: Hemorrhagic cystitis

Local: Burning, irritation

Ocular: Keratoconjunctivitis

Respiratory: Epistaxis, laryngitis, laryngeal obstruction, tracheitis

Miscellaneous: Allergic contact dermatitis, sensitivity reactions

Drug InteractionsThere are no known significant interactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, topical: 1% (59 mL); 2% (60 mL)

Generic AvailableYes

Mechanism of ActionTopical antiseptic/germicide effective against some vegetative gram-positive bacteria, particularly *Staphylococcus* sp, and some yeast; it is much less effective against gram-negative bacteria and is ineffective against acid-fast bacteria

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Ulceration of mucous membranes.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsCrystal Violet; Methylrosaniline Chloride

Glatiramer Acetate

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Copaxone® may be confused with Compazine®

Pronunciation(gla TIR a mer AS e tate)
U.S. Brand NamesCopaxone®
Canadian Brand NamesCopaxone®
Pharmacologic Category[Biological, Miscellaneous]
Use: Labeled IndicationsManagement of relapsing-remitting type multiple sclerosis
Dosing: AdultsMultiple sclerosis (relapsing-remitting): SubQ: 20 mg daily
Dosing: ElderlyRefer to adult dosing.
Administration: OtherFor SubQ administration in the arms, abdomen, hips, or thighs; rotate injection sites to prevent lipoatrophy. Bring to room temperature prior to use. Visually inspect the solution; discard if solution is cloudy or contains any particulate matter.
StorageStore in refrigerator at 2°C to 8°C (36°F to 46°F); excursions to room temperature for up to 1 month do not have a negative impact on potency. Avoid heat; protect from intense light.
ContraindicationsHypersensitivity to glatiramer acetate, mannitol, or any component of the formulation
Allergy Considerations

- Mannitol Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Systemic reactions: Immediate postinjection systemic reactions occur in a substantial percentage of patients (~10% in premarketing studies); symptoms may begin within minutes of injection and usually spontaneously resolve within 30 minutes. Most patients only have one reaction despite repeated administration.

Disease-related concerns:

- Renal impairment: Safety and efficacy has not been established in patients with renal impairment.

Special populations:

- Elderly: Safety and efficacy has not been established in the elderly.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Administration: For SubQ use only, **not for I.V. administration.**

- Antigenic: Glatiramer acetate is antigenic, and may possibly lead to the induction of untoward host responses.

Pregnancy Risk FactorB
Pregnancy ConsiderationsAdverse events were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women. Use in pregnancy only if clearly necessary.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions
>10%:

Cardiovascular: Vasodilation (27%), chest pain (21%), palpitation (17%)

Central nervous system: Pain (28%), anxiety (23%)

Dermatologic: Pruritus (18%), rash (18%)

Gastrointestinal: Nausea (22%), diarrhea (12%)

Local: Injection site reactions: Pain (73%), erythema (66%), inflammation (49%), pruritus (40%), mass (27%), induration (13%), welt (11%)

Neuromuscular & skeletal: Weakness (41%), arthralgia (24%), hypertonia (22%), back pain (16%)

Respiratory: Dyspnea (19%), rhinitis (14%)

Miscellaneous: Infection (50%), flu-like syndrome (19%), diaphoresis (15%), lymphadenopathy (12%)

1% to 10%:

Cardiovascular: Peripheral edema (7%), facial edema (6%), syncope (5%), tachycardia (5%), edema (3%), hypertension (1%)

Central nervous system: Fever (8%), vertigo (6%), migraine (5%), agitation (4%), chills (4%), confusion (2%), nervousness (2%), speech disorder (2%)

Dermatologic: Bruising (8%), erythema (4%), urticaria (4%), skin nodule (2%), eczema (1%), pustular rash (1%), skin atrophy (1%)

Endocrine & metabolic: Dysmenorrhea (6%)

Gastrointestinal: Anorexia (8%), vomiting (6%), gastrointestinal disorder (5%), gastroenteritis (3%), weight gain (3%), oral moniliasis (1%), salivary gland enlargement (1%), ulcerative stomatitis (1%)

Genitourinary: Urinary urgency (10%), vaginal moniliasis (8%), hematuria (1%)

Local: Injection site reactions: Hemorrhage (5%), urticaria (5%), edema (1%), atrophy (1%), abscess (1%), hypersensitivity (1%)

Neuromuscular & skeletal: Neck pain (8%), tremor (7%), foot drop (3%)

Ocular: Eye disorder (4%), nystagmus (2%)

Otic: Ear pain (7%)

Respiratory: Bronchitis (9%), laryngismus (5%)

Miscellaneous: Bacterial infection (5%), herpes simplex (4%), cyst (2%), herpes zoster (1%)

<1% (Limited to important or life-threatening): Angioedema, aphasia, atrial fibrillation, cholecystitis, coma, corneal ulcer, esophageal ulcer, esophagitis, ethanol intolerance, gastrointestinal hemorrhage, GI carcinoma, gout, hallucination, hematemesis, hepatomegaly, hypotension, injection site abscess, injection site fibrosis, leukopenia, manic reaction, optic neuritis, pancreatitis, pancytopenia, paraplegia, photosensitivity reaction, postural hypotension, priapism, rash, seizure, serum sickness, splenomegaly, stomatitis

Postmarketing and/or case reports (limited to important or life-threatening): Allergic reaction, anaphylactoid reaction, angina, arrhythmia, blindness, carcinoma (breast, bladder, lung), cardiomyopathy, CHF, cholelithiasis, cirrhosis, CNS neoplasm, glaucoma, hepatitis, lupus erythematosus, meningitis, MI, neuralgia, pericardial, effusion, pulmonary embolism, renal failure, rheumatoid arthritis, sepsis, stroke, thrombocytopenia, thrombosis

Drug InteractionsThere are no known significant interactions.

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess effectiveness and adverse response (eg, postinjection reactions - self-resolving flushing, chest tightness, dyspnea, palpitations). Teach patient proper use (reconstitution, injection technique, and syringe/needle disposal), possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationThis drug will not cure MS, but may help relieve the severity and frequency of attacks. This drug can only be given by subcutaneous injection; your prescriber will instruct you in how to prepare the medication, proper injection technique, and syringe/needle disposal. If using prefilled glass syringe, use **only** the auto*ject*® 2 *for glass syringe* device (not the original Copaxone® autoject). Do not stop or change doses without consulting your prescriber. May cause a transient reaction after injection, including flushing, chest tightness, dyspnea, or palpitations (usually last 30 minutes or less). May cause weakness, dizziness, confusion, nervousness, or anxiety (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or nausea or vomiting (frequent mouth care and sucking on lozenges may help). Report chest pain or pounding heartbeat; persistent diarrhea or GI upset; infection (vaginal itching or drainage, sores in mouth, unusual fever or chills) or flu-like symptoms (swollen glands, chills, excessive sweating); bruising, rash, or skin irritation; joint pain or neck pain; swelling of puffiness of face; vision changes or ear pain; unusual cough or respiratory difficulty; alterations in menstrual pattern; skin depression, hard lump, redness, pain, or swelling at injection site; or any other persistent adverse reactions. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

Copaxone®: 20 mg/mL (1 mL) [prefilled syringe; contains mannitol; packaged with alcohol pads]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Kit (Copaxone)

20 mg/mL (1): $2563.84

Mechanism of ActionGlatiramer is a mixture of random polymers of four amino acids; L-alanine, L-glutamic acid, L-lysine and L-tyrosine, the resulting mixture is antigenically similar to myelin basic protein, which is an important component of the myelin sheath of nerves; glatiramer is thought to induce and activate T-lymphocyte suppressor cells specific for a myelin antigen, it is also proposed that glatiramer interferes with the antigen-presenting function of certain immune cells opposing pathogenic T-cell function

Pharmacodynamics/Kinetics

Distribution: Small amounts of intact and partial hydrolyzed drug enter lymphatic circulation

Metabolism: SubQ: Large percentage hydrolyzed locally

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Ulcerative stomatitis, salivary gland enlargement, and oral moniliasis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause anxiety or depression

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsCopolymer-1

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(GLYE kla zide)

Canadian Brand NamesApo-Gliclazide®; Diamicron®; Diamicron® MR; Gen-Gliclazide; Gliclazide-80; Novo-Gliclazide; PMS-Gliclazide; Sandoz-Gliclazide

Pharmacologic CategoryAntidiabetic Agent, Sulfonylurea

Use: Labeled IndicationsManagement of type 2 diabetes mellitus (noninsulin dependent, NIDDM)

Dosing: AdultsType 2 diabetes: Oral:

Immediate release tablet: Initial: 80-160 mg/day; dose range 80-320 mg/day; dosage of ≥160 mg should be divided into 2 equal parts for twice-daily administration; maximum dose: 320 mg/day. Should be taken with meals.

Sustained release tablet: 30-120 mg once daily

Note: There is no fixed dosage regimen for the management of diabetes mellitus with gliclazide or any other hypoglycemic agent. Dose must be individualized based on frequent determinations of blood glucose during dose titration and throughout maintenance.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentContraindicated in severe impairment.

Dosing: Hepatic ImpairmentContraindicated in severe impairment.

Administration: OralPatients who are anorexic or NPO, may need to have their dose held to avoid hypoglycemia. Should be administered with meals.

Dietary ConsiderationsShould be taken with meals. Dietary modification based on ADA recommendations is a part of therapy. Decreases blood glucose concentration. Hypoglycemia may occur. Must be able to recognize symptoms of hypoglycemia (palpitations, sweaty palms, lightheadedness).

StorageStore at 20°C to 30°C (68°F to 86°F).

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to gliclazide, sulfonylureas, or any component of the formulation; type 1 diabetes mellitus (insulin dependent, IDDM), diabetic ketoacidosis with or without coma; renal or hepatic impairment; pregnancy (per manufacturer); breast-feeding

Allergy Considerations

- Sulfonylurea Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Cardiovascular mortality: Product labeling of sulfonylureas (in U.S.) states oral hypoglycemic drugs may be associated with an increased cardiovascular mortality as compared to treatment with diet alone or diet plus insulin. Data to support this association are limited, and several studies, including a large prospective trial (UKPDS), have not supported an association.

- Hypoglycemia: All sulfonylurea drugs are capable of producing severe hypoglycemia. Hypoglycemia is more likely to occur when caloric intake is deficient, after severe or prolonged exercise, when ethanol is ingested, or when more than one glucose-lowering drug is used. It is also more likely in elderly patients, malnourished patients and in patients with impaired renal or hepatic function; use with caution.

- Sulfonamide allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe.

Disease-related concerns:

- Stress-related states: It may be necessary to discontinue therapy and administer insulin if the patient is exposed to stress (fever, trauma, infection, surgery).

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsAge, hepatic impairment, and renal impairment are independent risk factors for hypoglycemia; conservative initial dosing and slow titration are required to avoid hypoglycemic reactions; dosage titration should be made at weekly intervals. Intensive glucose control (Hb A_{1c} <6.5) has been linked to increased all cause and cardiovascular mortality, hypoglycemia requiring assistance, and weight gain in adult type 2 diabetes. For elderly patients with diabetes who are relatively healthy, attaining target goals for aspirin use, blood pressure, lipids, smoking cessation, and diet and exercise may be more important than normalized glycemic control.

Pregnancy Risk FactorNot available (similar agents rated C); manufacturer contraindicates use

Pregnancy ConsiderationsClinical effects on the fetus: Crosses the placenta. Hypoglycemia; ear defects reported with sulfonylureas; other malformations reported but may have been secondary to poor maternal glucose control/diabetes. Insulin is the drug of choice for the control of diabetes mellitus during pregnancy.

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsPotential for neonatal hypoglycemia contraindicates use.

Adverse ReactionsFrequency not defined.

Central nervous system: Headache, nervousness, dizziness

Dermatologic: Rash, erythema, pruritus, urticaria. Sulfonylureas have also been associated with rare photosensitivity and porphyria cutanea tarda

Endocrine & metabolic: Hypoglycemia (dose dependent), hyponatremia (rare)

Gastrointestinal: Nausea, vomiting, diarrhea, epigastric fullness, gastritis

Hematologic: Agranulocytosis, leukopenia, thrombocytopenia, anemia

Hepatic: Jaundice, LDH increased, transaminases increased

Miscellaneous: Disulfiram reaction (very low potential)

Drug Interactions

Alcohol (Ethyl): Sulfonylureas may enhance the adverse/toxic effect of Alcohol (Ethyl). A flushing reaction may occur. *Risk C: Monitor therapy*

Chloramphenicol: May decrease the metabolism of Sulfonylureas. *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Sulfonylureas. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Cyclic Antidepressants: May enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

CycloSPORINE: Sulfonylureas may increase the serum concentration of CycloSPORINE. *Risk C: Monitor therapy*

Fibric Acid Derivatives: May enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

Fluconazole: May increase the serum concentration of Sulfonylureas. *Risk C: Monitor therapy*

Herbs (Hypoglycemic Properties): May enhance the hypoglycemic effect of Hypoglycemic Agents. *Risk C: Monitor therapy*

Luteinizing Hormone-Releasing Hormone Analogs: May diminish the therapeutic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Pegvisomant: May enhance the hypoglycemic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: May enhance the hypoglycemic effect of Sulfonylureas. This appears to be particularly concerning early in the course of combination therapy. Quinolone Antibiotics may diminish the hypoglycemic effect of Sulfonylureas. With longer-term combination, there is a greater risk of hyperglycemia. *Risk C: Monitor therapy*

Rifampin: May increase the metabolism of Sulfonylureas. *Risk C: Monitor therapy*

Salicylates: May enhance the hypoglycemic effect of Sulfonylureas. Of concern with regular, higher doses of salicylates, not sporadic, low doses. *Risk C: Monitor therapy*

Somatropin: May diminish the hypoglycemic effect of Antidiabetic Agents. *Risk D: Consider therapy modification*

Sulfonamide Derivatives: May enhance the hypoglycemic effect of Sulfonylureas. **Exceptions:** Sulfacetamide. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may cause hypoglycemia and/or rare disulfiram reactions).

Herb/Nutraceutical: Avoid chromium, garlic, gymnema (may cause hypoglycemia).

Monitoring ParametersSigns and symptoms of hypoglycemia, fasting blood glucose, hemoglobin A_{1c}

Reference RangeRecommendations for glycemic control in adults with diabetes:

Hb A_{1c}: <7%

Preprandial capillary plasma glucose: 70-130 mg/dL

Peak postprandial capillary blood glucose: <180 mg/dL

Blood pressure: <130/80 mm Hg

Monitoring: Lab Tests Fasting blood glucose, hemoglobin A_{1c}

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Tablet: 80 mg [not available in the U.S.]

Diamicron® [CAN]: 80 mg [not available in the U.S.]

Tablet, sustained release:

Diamicron® MR [CAN]: 30 mg [not available in the U.S.]

Generic Available Yes: 80 mg tablet

ManufacturerServier (Canada)

Mechanism of Action Stimulates insulin release from the pancreatic beta cells; reduces glucose output from the liver; lowers plasma glucose concentrations. Gliclazide has also been shown to decrease platelet aggregation at therapeutic doses.

Pharmacodynamics/Kinetics

Absorption: Rapid

Protein binding: 94%

Metabolism: Hepatic, to inactive metabolites

Half-life elimination: 10 hours

Time to peak: 4-6 hours

Excretion: Urine (60% to 70%) and feces (10% to 20%) as metabolites

Pharmacotherapy Pearls Not available in U.S.

Dental Health: Effects on Dental Treatment Gliclazide-dependent patients with diabetes (noninsulin dependent, type 2) should be appointed for dental treatment in morning in order to minimize chance of stress-induced hypoglycemia.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status May cause nervousness and dizziness

Mental Health: Effects on Psychiatric Treatment May cause leukopenia, thrombocytopenia, and agranulocytosis; use caution with clozapine, carbamazepine, and valproic acid

Cardiovascular Considerations The possibility of higher doses of sulfonylureas eliciting an increase in cardiovascular events, because of their effects on blocking potassium sensitive ATP channels, has been raised. However, there are presently only limited data to support this premise, particularly with newer generation agents. An early study suggested poor cardiovascular outcomes in patients with diabetes treated with tolbutamide. Retrospective studies evaluating cardiovascular outcomes following angioplasty and acute myocardial infarction in patients with diabetes receiving newer sulfonylureas are inconsistent. Longer-term prospective trials of sulfonylurea therapy, such as the UKPDS, do not reveal any increased cardiovascular mortality.

Medication Safety Issues

Sound-alike/look-alike issues:

Glimepiride may be confused with glipiZIDE

Amaryl® may be confused with Altace®, Amerge®, Reminyl®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(GLYE me pye ride)

U.S. Brand NamesAmaryl®

Canadian Brand NamesAmaryl®; Apo-Glimepiride; CO Glimepiride; Novo-Glimepiride; PMS-Glimepiride; ratio-Glimepiride; Rhoxal-glimepiride; Sandoz-Glimepiride

Pharmacologic CategoryAntidiabetic Agent, Sulfonylurea

Use: Labeled IndicationsManagement of type 2 diabetes mellitus (noninsulin dependent, NIDDM) as an adjunct to diet and exercise to lower blood glucose; may be used in combination with metformin or insulin in patients whose hyperglycemia cannot be controlled by diet and exercise in conjunction with a single oral hypoglycemic agent

Dosing: Adults

Type 2 diabetes: Oral:

Initial: 1-2 mg once daily, administered with breakfast or the first main meal

Adjustment: Allow several days between dose titrations: usual maintenance dose: 1-4 mg once daily; after a dose of 2 mg once daily, increase in increments of 2 mg at 1- to 2-week intervals based upon the patient's blood glucose response to a maximum of 8 mg once daily. If inadequate response to maximal dose, combination therapy with metformin may be considered.

Combination with insulin therapy:

Note: Fasting glucose level for instituting combination therapy is in the range of >150 mg/dL in plasma or serum depending on the patient)

Initial: 8 mg once daily with the first main meal

Adjustment: After starting with low-dose insulin, upward adjustments of insulin can be done approximately weekly as guided by frequent measurements of fasting blood glucose. Once stable, combination-therapy patients should monitor their capillary blood glucose on an ongoing basis, preferably daily.

Conversion from therapy with long half-life agents: Observe patient carefully for 1-2 weeks when converting from a longer half-life agent (eg, chlorpropamide) to glimepiride due to overlapping hypoglycemic effects.

Dosing: ElderlyInitial: 1 mg/day; dose titration and maintenance dosing should be conservative to avoid hypoglycemia

Dosing: Pediatric**Type 2 diabetes:** Oral: Children 10-18 years (unlabeled use): Initial: 1 mg once daily; maintenance: 1-4 mg once daily

Dosing: Renal ImpairmentCl_{cr} <22 mL/minute: Initial starting dose should be 1 mg and dosage increments should be based on fasting blood glucose levels.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralAdminister once daily with breakfast or first main meal of the day. Patients who are NPO may need to have their dose held to avoid hypoglycemia.

Dietary ConsiderationsAdminister with breakfast or the first main meal of the day. Dietary modification based on ADA recommendations is a part of therapy. Decreases blood glucose concentration. Hypoglycemia may occur. Must be able to recognize symptoms of hypoglycemia (palpitations, sweaty palms, lightheadedness).

ContraindicationsHypersensitivity to glimepiride, any component of the formulation, or sulfonamides; diabetic ketoacidosis (with or without coma)

Allergy Considerations

- Sulfonylurea Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Cardiovascular mortality: Product labeling states oral hypoglycemic drugs may be associated with an increased cardiovascular mortality as compared to treatment with diet alone or diet plus insulin. Data to support this association are limited, and several studies, including a large prospective trial (UKPDS) have not supported an association.

- Hypoglycemia: All sulfonylurea drugs are capable of producing severe hypoglycemia. Hypoglycemia is more likely to occur when caloric intake is deficient, after severe or prolonged exercise, when ethanol is ingested, or when more than one glucose-lowering drug is used. It is also more likely in elderly patients, malnourished patients and in patients with impaired renal or hepatic function; use with caution.

- Sulfonamide allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe.

Disease-related concerns:

- Stress-related states: It may be necessary to discontinue therapy and administer insulin if the patient is exposed to stress (fever, trauma, infection, surgery).

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsRapid and prolonged hypoglycemia (>12 hours) despite hypertonic glucose injections have been reported with glimepiride. Age, hepatic impairment, and renal impairment are independent risk factors for hypoglycemia; dosage titration should be made at weekly intervals. How “tightly” a geriatric patient's blood glucose should be controlled is controversial; however, a fasting blood sugar of <150 mg/dL is now an acceptable endpoint. Such a decision should be based on the patient's functional and cognitive status, how well they recognize hypoglycemic or hyperglycemic symptoms, and how to respond to them and their other disease states. Intensive glucose control (Hb A_{1c} <6.5) has been linked to increased all cause and cardiovascular mortality, hypoglycemia requiring assistance, and weight gain in adult type 2 diabetes. For elderly patients with diabetes who are relatively healthy, attaining target goals for aspirin use, blood pressure, lipids, smoking cessation, and diet and exercise may be more important than normalized glycemic control.

Pregnancy Risk FactorC

Pregnancy Considerations

Adverse events have been observed in animal studies; therefore, glimepiride is classified as pregnancy category C. Severe hypoglycemia lasting 4-10 days has been noted in infants born to mothers taking a sulfonylurea at the time of delivery. The manufacturer recommends that patients be switched to insulin during pregnancy. Maternal hyperglycemia can be associated with adverse effects in the fetus, including macrosomia, neonatal hyperglycemia, and hyperbilirubinemia; the risk of congenital malformations is increased when the Hb A_{1c} is above the normal range. Diabetes can also be associated with adverse effects in the mother. Poorly-treated diabetes may cause end-organ damage that may in turn negatively affect obstetric outcomes. Physiologic glucose levels should be maintained prior to and during pregnancy to decrease the risk of adverse events in the mother and the fetus. Until additional safety and efficacy data are obtained, the use of oral agents is generally not recommended as routine management of GDM or type 2 diabetes mellitus during pregnancy. Insulin is the drug of choice for the control of diabetes mellitus during pregnancy.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsIt is not known if glimepiride is excreted in breast milk. Breast-feeding is not recommended by the manufacturer. Potentially, hypoglycemia may occur in a nursing infant exposed to a sulfonylurea via breast milk.

Pregnancy & Lactation, In-Depth

- Glimepiride in Pregnancy & Lactation

Adverse Reactions

1% to 10%:

Central nervous system: Dizziness (2%), headache (2%)

Endocrine & metabolic: Hypoglycemia (1% to 2%)

Gastrointestinal: Nausea (1%)

Neuromuscular & skeletal: Weakness (2%)

<1% or frequency not defined: Agranulocytosis, anorexia, aplastic anemia, cholestatic jaundice, constipation, diarrhea, disulfiram-like reaction, diuretic effect, edema, epigastric fullness, gastrointestinal pain, erythema, heartburn, hemolytic anemia, hepatitis, hypoglycemia, hyponatremia, leukopenia, liver function tests abnormal, nausea, pancytopenia, photosensitivity, porphyria cutanea tarda, pruritus, rash (morbilliform or maculopapular), SIADH, thrombocytopenia, urticaria, vasculitis (allergic), visual accommodation changes (early treatment), vomiting

Metabolism/Transport Effects**Substrate** of CYP2C9 (major)

Drug Interactions

Alcohol (Ethyl): Sulfonylureas may enhance the adverse/toxic effect of Alcohol (Ethyl). A flushing reaction may occur. *Risk C: Monitor therapy*

Chloramphenicol: May decrease the metabolism of Sulfonylureas. *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Sulfonylureas. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Cyclic Antidepressants: May enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

CycloSPORINE: Sulfonylureas may increase the serum concentration of CycloSPORINE. *Risk C: Monitor therapy*

CYP2C9 Inducers (Highly Effective): May increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Moderate): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Strong): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

Fibric Acid Derivatives: May enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

Fluconazole: May increase the serum concentration of Sulfonylureas. *Risk C: Monitor therapy*

Herbs (Hypoglycemic Properties): May enhance the hypoglycemic effect of Hypoglycemic Agents. *Risk C: Monitor therapy*

Luteinizing Hormone-Releasing Hormone Analogs: May diminish the therapeutic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Pegvisomant: May enhance the hypoglycemic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: May enhance the hypoglycemic effect of Sulfonylureas. This appears to be particularly concerning early in the course of combination therapy. Quinolone Antibiotics may diminish the hypoglycemic effect of Sulfonylureas. With longer-term combination, there is a greater risk of hyperglycemia. *Risk C: Monitor therapy*

Rifampin: May increase the metabolism of Sulfonylureas. *Risk C: Monitor therapy*

Salicylates: May enhance the hypoglycemic effect of Sulfonylureas. Of concern with regular, higher doses of salicylates, not sporadic, low doses. *Risk C: Monitor therapy*

Somatropin: May diminish the hypoglycemic effect of Antidiabetic Agents. *Risk D: Consider therapy modification*

Sulfonamide Derivatives: May enhance the hypoglycemic effect of Sulfonylureas. **Exceptions:** Sulfacetamide. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Caution with ethanol (may cause hypoglycemia).

Herb/Nutraceutical: Caution with chromium, garlic, gymnema (may cause hypoglycemia).

Monitoring ParametersUrine for glucose and ketones; monitor for signs and symptoms of hypoglycemia (fatigue, excessive hunger, profuse sweating, numbness of extremities), fasting blood glucose, hemoglobin A_{1c}, fructosamine

Reference RangeRecommendations for glycemic control in adults with diabetes:

Hb A_{1c}: <7%

Preprandial capillary plasma glucose: 70-130 mg/dL

Peak postprandial capillary blood glucose: <180 mg/dL

Blood pressure: <130/80 mm Hg

Nursing: Physical Assessment/MonitoringAssess any allergies prior to beginning therapy. Assess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess results of laboratory tests, therapeutic effectiveness, and adverse response at regular intervals during therapy. Teach patient proper use (or refer patient to diabetic educator for instruction), possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsUrine for glucose and ketones, fasting blood glucose, hemoglobin A_{1c}, fructosamine

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication is used to control diabetes; it is not a cure. Monitor glucose as recommended by prescriber. Other important components of treatment plan may include prescribed diet and exercise regimen (consult prescriber or diabetic educator). Always carry quick source of sugar with you. Take exactly as directed with breakfast or the first main meal of the day. Do not change dose or discontinue without consulting prescriber. Avoid alcohol while taking this medication; could cause severe reaction. Do not take other medication within 2 hours of this medication unless advised by prescriber. If you experience hypoglycemic reaction, contact prescriber immediately. You may experience side effects during first weeks of therapy (eg, headache, nausea); consult prescriber if these persist. Report severe or persistent side effects (eg, hypoglycemia: palpitations, sweaty palms, lightheadedness; extended vomiting or flu-like symptoms; skin rash; easy bruising or bleeding; or change in color of urine or stool). **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 1 mg, 2 mg, 4 mg

Amaryl®: 1 mg, 2 mg, 4 mg

Generic AvailableYes

ManufacturerHoechst-Marion Roussel

Pricing: U.S. (www.drugstore.com)

Tablets (Amaryl)

1 mg (30): $28.20

2 mg (30): $36.89

4 mg (30): $52.99

Tablets (Glimepiride)

1 mg (30): $12.99

2 mg (90): $18.99

4 mg (30): $14.99

Mechanism of ActionStimulates insulin release from the pancreatic beta cells; reduces glucose output from the liver; insulin sensitivity is increased at peripheral target sites

Pharmacodynamics/Kinetics

Onset of action: Peak effect: Blood glucose reductions: 2-3 hours

Duration: 24 hours

Absorption: 100%; delayed when given with food

Distribution: V_d: 8.8 L

Protein binding: >99.5%

Metabolism: Hepatic oxidation via CYP2C9 to M1 metabolite (~33% activity of parent compound); further oxidative metabolism to inactive M2 metabolite

Half-life elimination: 5-9 hours

Time to peak, plasma: 2-3 hours

Excretion: Urine (60%, 80% to 90% as M1 and M2); feces (40%, 70% as M1 and M2)

Related Information

- Diabetes Mellitus Management, Adults
- Sulfonamide Derivatives

Dental Health: Effects on Dental TreatmentGlimepiride-dependent patients with diabetes (noninsulin dependent, type 2) should be appointed for dental treatment in morning in order to minimize chance of stress-induced hypoglycemia.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine and carbamazepine; phenothiazines and TCAs may antagonize glimepiride hypoglycemic effects; MAO inhibitors and TCAs may enhance hypoglycemic effects

Cardiovascular ConsiderationsThe possibility of higher doses of sulfonylureas eliciting an increase in cardiovascular events, because of their effects on blocking potassium sensitive ATP channels, has been raised. However, there are presently only limited data to support this premise, particularly with newer generation agents. An early study suggested poor cardiovascular outcomes in patients with diabetes treated with tolbutamide. Retrospective studies evaluating cardiovascular outcomes following angioplasty and acute myocardial infarction in patients with diabetes receiving newer sulfonylureas are inconsistent. Longer-term prospective trials of sulfonylurea therapy, such as the UKPDS, do not reveal any increased cardiovascular mortality.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(GLIP i zide & met FOR min)

U.S. Brand NamesMetaglip™

Pharmacologic CategoryAntidiabetic Agent, Biguanide; Antidiabetic Agent, Sulfonylurea

Use: Labeled IndicationsIndicated as an adjunct to diet and exercise to improve glycemic control in adults with type 2 diabetes mellitus (noninsulin dependent, NIDDM)

Dosing: Adults**Type 2 diabetes:**

Patients inadequately controlled on diet and exercise alone: Initial dose: Glipizide 2.5 mg/metformin 250 mg once daily with a meal. In patients with fasting plasma glucose (FPG) 280-320 mg/dL, initiate therapy with glipizide 2.5 mg/metformin 500 mg twice daily.

Note: Increase dose by 1 tablet/day every 2 weeks (maximum daily dose: glipizide 10 mg/metformin 2000 mg in divided doses)

Patients inadequately controlled on a sulfonylurea and/or metformin: Initial dose: Glipizide 2.5 mg/metformin 500 mg or glipizide 5 mg/metformin 500 mg twice daily with morning and evening meals; starting dose should not exceed current daily dose of glipizide (or sulfonylurea equivalent) and/or metformin.

Note: Increase dose in increments of no more than glipizide 5 mg/metformin 500 mg (maximum daily dose: glipizide 20 mg/metformin 2000 mg)

Dosing: ElderlyConservative doses are recommended in the elderly due to potentially decreased renal function; **do not titrate to maximum dose**; should not be used in patients ≥80 years unless renal function is verified as normal

Dosing: Renal ImpairmentContraindicated in the presence of renal disease or renal dysfunction (serum creatinine ≥1.5 mg/dL [males], ≥1.4 mg/dL [females], or abnormal creatinine clearance).

Dosing: Hepatic ImpairmentAvoid use in patients with impaired liver function.

Administration: OralAll doses should be administered with a meal. Twice-daily dosing should be administered with the morning and evening meals. Dietary modification based on ADA recommendations is a part of therapy. Patients that are NPO or require decreased caloric intake may need doses held to avoid hypoglycemia.

Dietary ConsiderationsMay cause GI upset; should be taken with food to decrease GI upset. Dietary modification based on ADA recommendations is a part of therapy. Decreases blood glucose concentration; hypoglycemia may occur. Must be able to recognize symptoms of hypoglycemia (palpitations, sweaty palms, lightheadedness). Monitor for signs and symptoms of vitamin B_{12} and folic acid deficiency; supplementation may be required.

StorageStore at room temperature of 20°C to 25°C (68°F to 77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to glipizide, metformin, or any component of the formulation; renal disease or renal dysfunction (serum creatinine ≥1.5 mg/dL in males or ≥1.4 mg/dL in females, or abnormal creatinine clearance which may also result from conditions such as cardiovascular collapse, acute myocardial infarction, and septicemia); acute or chronic metabolic acidosis with or without coma (including diabetic ketoacidosis)

Note: Temporarily discontinue in patients undergoing radiologic studies in which intravascular iodinated contrast materials are utilized.

Allergy Considerations

- Biguanide Allergy
- Sulfonylurea Allergy

Warnings/Precautions

Boxed warnings:

- Lactic acidosis: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Cardiovascular mortality: Product labeling states oral hypoglycemic drugs may be associated with an increased cardiovascular mortality as compared to treatment with diet alone or diet plus insulin. Data to support this association are limited, and several studies, including a large prospective trial (UKPDS) have not supported an association.

- Hypoglycemia: All sulfonylurea drugs are capable of producing severe hypoglycemia. Hypoglycemia is more likely to occur when caloric intake is deficient, after severe or prolonged exercise, when ethanol is ingested, or when more than one glucose-lowering drug is used. It is also more likely in elderly patients, malnourished patients and in patients with impaired renal, hepatic, adrenal and/or pituitary function; use with caution.

- Lactic acidosis: **[U.S. Boxed Warning]: Lactic acidosis is a rare, but potentially severe consequence of therapy with metformin.** Lactic acidosis should be suspected in any patient with diabetes receiving metformin with evidence of acidosis but without evidence of ketoacidosis. Discontinue metformin in clinical situations predisposing to hypoxemia, including conditions such as cardiovascular collapse, respiratory failure, acute myocardial infarction, acute congestive heart failure, and septicemia. The risk of accumulation and lactic acidosis increases with the degree of impairment of renal function and patient age.

- Sulfonamide allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is not specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe.

Disease-related concerns:

- Heart failure: Use metformin with caution in patients with congestive heart failure requiring pharmacologic management, particularly in patients with unstable or acute heart failure; risk of lactic acidosis may be increased secondary to hypoperfusion.

- Hepatic impairment: Avoid metformin use in patients with impaired liver function due to potential for lactic acidosis; use glipizide with caution in patients with severe hepatic disease.

- Renal impairment: Metformin is substantially excreted by the kidney; patients with renal function below the limit of normal for their age should not receive therapy. Use of concomitant medications that may affect renal function (ie, affect tubular secretion) may also affect metformin disposition. Metformin should be withheld in patients with dehydration and/or prerenal azotemia.

- Stress-related states: It may be necessary to discontinue metformin and administer insulin if the patient is exposed to stress (fever, trauma, infection, surgery).

Special populations:

- Elderly: Metformin should not be initiated in patients ≥80 years of age unless normal renal function is confirmed. Risk of lactic acidosis increases with age.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Ethanol use: Instruct patients to avoid excessive acute or chronic ethanol use; ethanol may potentiate metformin's effect on lactate metabolism and increase risk of hypoglycemia.

- Iodinated contrast: Metformin therapy should be temporarily discontinued prior to or at the time of intravascular administration of iodinated contrast media (potential for acute alteration in renal function). Metformin should be withheld for 48 hours after the radiologic study and restarted only after renal function has been confirmed as normal.

- Surgical procedures: Metformin therapy should be suspended for any surgical procedures (resume only after oral intake resumed and normal renal function is verified).

Geriatric ConsiderationsIntensive glucose control (Hb A_{1c} <6.5) has been linked to increased all cause and cardiovascular mortality, hypoglycemia requiring assistance, and weight gain in adult type 2 diabetes. For elderly patients with diabetes who are relatively healthy, attaining target goals for aspirin use, blood pressure, lipids, smoking cessation, and diet and exercise may be more important than normalized glycemic control.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies were not conducted with this combination; therefore, glipizide/metformin is classified as pregnancy category C. Refer to individual agents.

Lactation

Glipizide: Excretion in breast milk unknown/not recommended

Metformin: Enters breast milk/not recommended

Breast-Feeding ConsiderationsRefer to individual agents.

Pregnancy & Lactation, In-Depth

- GlipiZIDE in Pregnancy & Lactation
- MetFORMIN in Pregnancy & Lactation

Adverse ReactionsAlso see individual agents.

>10%:

Central nervous system: Headache (13%)

Endocrine & metabolic: Hypoglycemia (8% to 13%)

Gastrointestinal: Diarrhea (2% to 18%)

1% to 10%:

Cardiovascular: Hypertension (3% to 4%)

Central nervous system: Dizziness (2% to 5%)

Gastrointestinal: Nausea/vomiting (<1% to 8%), abdominal pain (6%)

Neuromuscular & skeletal: Musculoskeletal pain (8%)

Renal: Urinary tract infection (1%)

Respiratory: Upper respiratory tract infection (8% to 10%)

Metabolism/Transport EffectsGlipizide: **Substrate** of 2C8/9 (major)
Drug Interactions

Alcohol (Ethyl): Sulfonylureas may enhance the adverse/toxic effect of Alcohol (Ethyl). A flushing reaction may occur. *Risk C: Monitor therapy*

Cephalexin: May increase the serum concentration of MetFORMIN. *Risk C: Monitor therapy*

Chloramphenicol: May decrease the metabolism of Sulfonylureas. *Risk C: Monitor therapy*

Cimetidine: May decrease the excretion of MetFORMIN. *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Sulfonylureas. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Cyclic Antidepressants: May enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

CycloSPORINE: Sulfonylureas may increase the serum concentration of CycloSPORINE. *Risk C: Monitor therapy*

CYP2C9 Inducers (Highly Effective): May increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Moderate): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Strong): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

Fibric Acid Derivatives: May enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

Fluconazole: May increase the serum concentration of Sulfonylureas. *Risk C: Monitor therapy*

Herbs (Hypoglycemic Properties): May enhance the hypoglycemic effect of Hypoglycemic Agents. *Risk C: Monitor therapy*

Iodinated Contrast Agents: May enhance the adverse/toxic effect of MetFORMIN. Renal dysfunction that may be caused by iodinated contrast agents may lead to metformin-associated lactic acidosis. *Risk D: Consider therapy modification*

Luteinizing Hormone-Releasing Hormone Analogs: May diminish the therapeutic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Pegvisomant: May enhance the hypoglycemic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: May enhance the hypoglycemic effect of Sulfonylureas. This appears to be particularly concerning early in the course of combination therapy. Quinolone Antibiotics may diminish the hypoglycemic effect of Sulfonylureas. With longer-term combination, there is a greater risk of hyperglycemia. *Risk C: Monitor therapy*

Rifampin: May increase the metabolism of Sulfonylureas. *Risk C: Monitor therapy*

Salicylates: May enhance the hypoglycemic effect of Sulfonylureas. Of concern with regular, higher doses of salicylates, not sporadic, low doses. *Risk C: Monitor therapy*

Somatropin: May diminish the hypoglycemic effect of Antidiabetic Agents. *Risk D: Consider therapy modification*

Sulfonamide Derivatives: May enhance the hypoglycemic effect of Sulfonylureas. **Exceptions:** Sulfacetamide. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsSee individual agents.
Monitoring ParametersSigns and symptoms of hypoglycemia, urine (glucose and ketones), FPG, Hb A_{1c}, and fructosamine. Initial and periodic monitoring of hematologic parameters (eg, hemoglobin/hematocrit and red blood cell indices) and renal function should be performed; monitor at least annually once patient is on maintenance therapy. While megaloblastic anemia has been rarely seen with metformin, if suspected, vitamin B_{12} deficiency should be excluded.
Reference RangeRecommendations for glycemic control in adults with diabetes:

Hb A_{1c}: <7%

Preprandial capillary plasma glucose: 70-130 mg/dL

Peak postprandial capillary blood glucose: <180 mg/dL

Blood pressure: <130/80 mm Hg

Nursing: Physical Assessment/MonitoringSee individual agents.
Monitoring: Lab TestsSee individual agents.

Patient EducationSee individual agents.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 2.5/250: Glipizide 2.5 mg and metformin hydrochloride 250 mg; 2.5/500: Glipizide 2.5 mg and metformin hydrochloride 500 mg; 5/500: Glipizide 5 mg and metformin hydrochloride 500 mg

Metaglip™ 2.5/250: Glipizide 2.5 mg and metformin hydrochloride 250 mg

Metaglip™ 2.5/500: Glipizide 2.5 mg and metformin hydrochloride 500 mg

Metaglip™ 5/500: Glipizide 5 mg and metformin hydrochloride 500 mg

Generic AvailableYes
ManufacturerBristol-Myers Squibb Company
Pricing: U.S. (www.drugstore.com)

Tablets (GlipiZIDE-MetFORMIN HCl)

2.5-500 mg (60): $74.99

Tablets (GlipiZIDE-Metformin HCl)

5-500 mg (60): $63.99

Tablets (Metaglip)

2.5-250 mg (30): $38.51

Mechanism of ActionThe combination of glipizide and metformin is used to improve glycemic control in patients with type 2 diabetes mellitus (noninsulin dependent, NIDDM) by using two different, but complementary, mechanisms of action:

Glipizide: Stimulates insulin release from the pancreatic beta cells; reduces glucose output from the liver; insulin sensitivity is increased at peripheral target sites

Metformin: Decreases hepatic glucose production, decreasing intestinal absorption of glucose and improves insulin sensitivity (increases peripheral glucose uptake and utilization)

Pharmacodynamics/KineticsSee individual agents.
Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Upper respiratory tract infection (8% to 10%). Dependent patients with diabetes (noninsulin dependent, type 2) should be appointed for dental treatment in the morning in order to minimize chance of stress-induced hypoglycemia.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause dizziness
Mental Health: Effects on Psychiatric TreatmentDiarrhea is common; use caution with SSRIs. May rarely cause agranulocytosis; use caution with clozapine and carbamazepine. Phenothiazines and TCAs may antagonize glipizide hypoglycemic effects; MAO inhibitors and TCAs may enhance hypoglycemic effects.
Index TermsGlipizide and Metformin Hydrochloride; Metformin and Glipizide
